**ALL THE HOT WATER YOU WANT
IN THE DAIRY COSTS ONLY
A FEW CENTS A DAY**

WITH an Electric Dairy Water Heater, you can have all the hot water you want, when you want it . . . and for but a few cents a day. This modern convenience provides a ready supply for washing and for scalding milking utensils. The result is a better, more sanitary grade of milk, to sell at a higher price.

Completely automatic, the Electric Dairy Water Heater starts and stops itself. Stores hot water like a huge thermos bottle. No fuel, no fire needed. No soot or smoke in the milk house. Modernizes the dairy. Lowers bacteria count.

Plan now to let low cost electricity do more of your work on the farm. Call our Rural Service Department today for full information:

More Tractor Owners Use Gasoline

THE American Farmer has gone on record by stating his preferences in fuels for automobile, truck and tractor. A large-scale cooperative survey conducted by 40 farm publications, shows that the farmer owns an average of two and a half motor vehicles; that the automobile is the most widely owned vehicle, although the tractor uses twice as much fuel; that the farmer's preference in the matter of fuels is gasoline, by a wide margin; that 25 per cent of the tractors owned by farmers covered in the survey had high compression engines; and that the farmers as a group buy approximately five billion gallons of motor fuel a year.

While the survey was concentrated principally in the 18 leading tractor states, replies were received from every state in the union.

The 6,729 farmers answering the questionnaires owned 16,592 motor vehicles. The automobile, of course, was the most popular vehicle. The farmers owned 7,558 cars or slightly better than one car each. Tractors ranked second. Four thousand two hundred twenty-eight farmers reported ownership of 5,441 tractors, or about one and a quarter each. Trucks numbered 3,563, or about one for every two farmers.

Although the automobile was the most widely owned, farmers used twice as much fuel in their tractors as they did in their cars. The 5,441 tractors reported used 5,527,903 gallons of fuel, or an average of 1,016 gallons each. The automobiles used an average of only 520 gallons. The trucks consumed 910 gallons each.

In the matter of fuel preference, it was gasoline by a wide margin. Gasoline was used exclusively in automobiles and trucks and 63% of all fuel used in tractors also was gasoline. One of the surprising features of the survey was the

fact that although low compression tractors are said to be able to burn any kind of fuel, 54 per cent of the fuel actually used in such tractors was gasoline. Oddly enough, two per cent of that amount was reported as premium gasoline. However, this may have been due to misunderstanding or confusion on the part of the farmer between the name of "Ethyl" gasoline and regular-grade gasoline containing "tetraethyl lead". Distillate accounted for 25 per cent of the fuel used in low compression tractors, kerosene for 9 per cent. In the newer high compression tractors, of course, the fuel used was predominantly regular-grade gasoline.

High compression tractors are becoming an important factor in the field. The survey shows that 25 per cent of the farmers owning tractors had high compression machines. The figures: 1,364 high compression; 4,112 low compression. These figures will surprise even experts in the farm machinery field in view of the fact that the first high compression tractor was put on the market only three years ago.

And the trend shows promise of continuing. Asking what type tractor they would buy, 663 farmers, or 17 per cent, said high compression. Six per cent said low compression. Sixteen per cent were undecided and 61 per cent failed to answer.

* * *

The American Guernsey Cattle Club, Peterboro, N. H., recently printed a 48-page booklet on "Fascinating and Profitable Guernseys," containing authentic valuable information on judging, showing and breeding. This book, which is priced at 50c, is of value to any Guernsey breeder or to high school students who are studying dairying.

This PERFECTION porcelain enameled oil range has the oven burners mounted on a slide which can be drawn out in front for convenience in lighting. Mounted on the same slide is a one-gallon glass fuel reservoir which can be lifted out for outside filling. This entire assembly can be lifted out and, with a folding stove frame, supplied at small additional cost, can be used as a separate 2-burner stove for canning, laundry, or other purposes, without interrupting the three cooking-top burners, which are served by a separate 2-gallon fuel reservoir. This 2-gallon reservoir also can be lifted out from the front and can be taken out for refilling without interrupting the operation of the burners.

NEARBY MARKETS for NEARBY POULTRYMEN

A Legally Fresh Egg

By J. C. HUTTAR

PRACTICALLY every one of the thirteen original states of this Union which we now commonly call the Northeast, has enacted a so-called Fresh Egg Law.

The first of these was enacted into the laws of the State of New York on September 12, 1927. Berne A. Pyrke

J. C. Huttar

was then Commissioner of Agriculture, Kenneth F. Fee the Director of the Dairy and Food Bureau, and Frank A. Jones Supervising Inspector of the Department of Agriculture and Markets.

Commissioner Pyrke has been succeeded by a number of Governors' appointees, Kenneth Fee is in another bureau of the Department and C. R. Plumb is

now in charge of food control. But Frank Jones is still at his post.

I just ought to say right here that to my mind Frank is the kind of State employee we all hope for. He is honest, conscientious, fair, and capable in his work. With his small band of inspectors, Frank had to work on the enforcement of many other food laws in addition to eggs. These included such products as frozen desserts, milk, commercial feeding stuffs, fruits, meats, etc. At present all of his time is devoted to egg enforcement work.

Cold Storage Law

Before September 12, 1927, only two provisions legally governed the sale of eggs. One was the so-called cold-storage law. This said that any eggs which had been held in cold storage must be so represented when offered for sale. Experience in the enforcement of this law brought out two big weaknesses.

1. There is no known test which tells whether an egg had been held in storage or not. Unscrupulous egg merchants soon found this out and so paid little attention to the law. Honest, reputable merchants often obeyed the law, however, and were put to a great disadvantage. (More about this below).
2. No matter how old an egg was or how poor, providing it was edible, it could be sold as a Fancy Fresh Egg, if it was held outside of a cold storage room. Thus the law actually put a penalty on what science proved to be the best way to keep up egg quality.

Not only were the honest merchants hurt by the law but egg producers as a whole, and the fine egg producers in particular as well. Here's how it worked in practice:

A dishonest merchant, during the high egg price season would buy eggs that had been in storage for six months or more. He would buy these eggs for much less than real fresh eggs would cost him. He would then candle them and make three classes.

1. The better looking ones.
2. The poorer looking ones.
3. Inedibles.

The first he would sell as "fresh", the second as "storage", and the third to leather tanners.

Now, real fresh eggs are scarce but some good merchant wants them for his trade and after paying 40 or 50

cents, wholesale, adds his 10 cents retail margin, and offers them for 50 or 60 cents a dozen. But across the street is this chiseler selling "Fresh Eggs" for anywhere from 29 to 39 cents.

This practice couldn't help but cut the demand for really fine fresh eggs and so the producer of such eggs lost out.

Furthermore, if we consider the general practice of storing as the means of carrying an uneatable surplus from the flush production period over until the scarce period, thus increasing total yearly egg consumption, then all poultrymen were hurt by those practices under the old cold storage law. Since only the poorest edible eggs were labeled "cold storage", it gave them a "black eye" with the public and so forced down the price of eggs in the storing season.

Edible Eggs

The other legal provision under which eggs were sold prior to September 1927 was found in the Pure Food and Drug Law of the United States. This law described the kind of eggs which were inedible, including such as blood spots, "incubators", rots, etc., and prohibited their sale for human consumption. This law is still in force and its provisions with regards to eggs were incorporated in the New York State Better Egg Law of September 12, 1937.

The present better egg law gives the Commissioner of Agriculture the power to set up standards for grades which must be used in selling eggs in New York State.

It also empowers him to set the standard of quality under which eggs may be called "Fresh" or by any word or description which may be interpreted to mean fresh.

This, Commissioner Pyrke did soon after the passage of the Better Egg Law. He said that no egg may be called "Fresh" when eggs are sold, offered for sale or advertised for sale, which does not meet the requirements of Grade A and is less than 30 days old. He specified what candling quality met his Grade A standards and sent his inspectors out under Frank Jones, first to educate then to get evidence against retailers violating this law.

Progress

In 1928 the Department of Agriculture and Markets' report shows that 88% of the inspections found violations of the Law. In 1930 this dropped to 52%, in 1932 to 43%, 1935 35%, and in 1936 only 29%. Of the 1936 violations only 12% could be classed as major violations having to do with egg quality.

"That reminds me—I was going to lay an egg today."

NEARBY MARKETS for NEARBY POULTRYMEN

Producing Profitable Pullets

(Continued from last issue.)

A Complete Ration

By L. E. WEAVER

ALMOST no one attempts to mix his own starting mash today. I can think of no sound reason for doing so. I can see several reasons why it is more advisable to purchase one of the many satisfactory brands available in every community. So little is used at

L. E. Weaver

first that savings would be negligible. Requirements for a complete ration for chicks are so many and so exacting that only a mill equipped with a laboratory and trained chemist can do a really competent job of putting together a starting ration. That does not hold to the same extent for a ration for chicks after they are out-of-doors and on a range with plenty of tender green feed. You are going to hear and read a lot about "poultry pastures". That means a grassy range fertilized, limed and mowed at intervals to furnish an abundance of short tender grazing for the growing pullets. Better pullets are grown at considerably lower cost.

Correct Management

The caretaker (usually the owner) now has the good chicks, good house, good equipment and complete ration. It becomes his responsibility to produce a full quota of pullets that will live and lay profitably. Largely it becomes a never-ending fight against parasites, disease, accidents and predatory animals, including crows, hawks and owls.

Good management may or may not require that the brooder houses shall be moved each season to an entirely different range. That depends mostly on how well last year's pullets have lived and layed. It most surely means moving them to a place where there is no bare spot surrounding the house. It means spreading the pullets as thinly over the range as is possible and yet practical. Houses spaced 100 feet apart each way with 250 chicks started in each house is a good rule. That figures out about 1000 chicks to the acre, or 500 pullets if losses are kept low.

Fencing the entire range cuts down on losses from foxes, dogs, skunks, perhaps human thieves.

Worms and coccidiosis are carried over from year to year in the soil. They are controlled to a considerable extent by rotation of the range, moving to clean territory each year. These practices are not effective against fowl paralysis, big liver and their related troubles. These do not live over in the soil or the houses. They come to the chicks from the old stock. Young chicks are highly susceptible. In spite of all precaution the chicks are almost certain to become infected as long as older stock, survivors of an outbreak of fowl paralysis are in the same vicinity. The Ohio Station suggests two ways of breaking up the cycle of infection. Have your pullets grown on some other farm where the disease is not known, or dispose of all the old birds two weeks or more before getting your chicks.

Profitable pullets must have large muscular gizzards. Grit from the start helps. It must be an insoluble grit. Mix 5 pounds of chick size grit into

100 pounds of mash. After 2 or 3 weeks put larger grit in several places around the pen. As soon as the chicks are eating it from these boxes you can leave it out of the mash.

Good management calls for precautions against chilling, particularly the very young chick. Most everyone can keep the temperature uniform and high enough. Many people do not know that chicks can be chilled from the inside and ruined. Always give them luke-warm water for the first few days.

* * *

Two Eggs a Day

YEARS ago I was told that a hen never lays more than one egg in one day. I believed it. That is just one of the many things that I have had to unlearn. Hens do lay two eggs a day sometimes. They do it more often than most people realize. Two cases came to my attention recently in Schoharie County.

Ray Pollard, Jr. at Cobleskill had 18 hens, all in heavy production. One day he got 19 eggs, all laid in the nests that same day. Ray Pollard, Sr. is county agricultural agent and vouches for this report. Another poultrykeeper in Schoharie county surpassed the Pollard record. His 28 hens laid 29 eggs one day last summer.

It's in the laying cages that the hens really go to town with this two-eggs-a-day stunt. On a plant with several hundred layers in batteries it is an almost daily occurrence for some bird to roll out an egg in the morning, and in the late afternoon a second egg will appear on the little wire shelf at the front of the cage. I have even been told that some caged layers have laid three eggs in one day.

Those stories may sound pretty good, but now listen to this. Twice within the past few months there have come to the poultry department at Cornell reports of hens that not only laid two eggs in a day, but kept right on doing it more or less regularly. One of these hens, a Barred Plymouth Rock became ill and was sent to the department; nothing about her appeared abnormal. The other, a White Leghorn, is owned by a thoroughly reliable man whom I have known for years.

If this sort of thing continues we will just have to believe it when someone reports a record of more than 365 eggs in a year.—L. E. Weaver.

Egg Consumption Drive

RECENTLY in New York City representatives of egg poultry associations and chain store buyers met to exchange viewpoints. Egg buyers reflected the opinion that New York State eggs are not well enough graded. Buyers also pointed out that they want a steady volume of high grade eggs so they can figure on supplying a steady demand.

The producers pointed out that production per hen is higher than it used to be, that seasonal conditions cause heavy production in the spring, and that the poultryman wants a steady outlet. He would rather see eggs go to consumers at this time of year than to see them go into cold storage.

The chief result of the conference was a plan for an egg consumption drive on the part of chain stores to run from April 20 to May 20. Eggs will be specially advertised, and every effort made to move them to consumers.

Money-Making 160 Acres

15 Cows, calves, good team, poultry, machinery, crops included; noted boarding house section, good 10-room house, 30-cow barn, choice farm only \$5000, part down; page 45 Free 100-page Spring catalog. STROUT REALTY, 255-R 4th Ave., New York City.

Say you saw it in AMERICAN AGRICULTURIST.

"Chicken Feed"

There are two kinds of chicken feed. One kind, you toss in the hen-house. The other, you frequently just toss away. It is small, indefinite amounts of money: two cents, six cents, nine cents, fifteen cents. But small though it is, that "chicken feed" can often be turned into dollars!

Right now, at baby-chick time, a thought or two about both kinds of chicken feed would not be out of order. In the advertising columns of this magazine you'll find valuable, scientific and trustworthy advice about mineral supplements, conditioners and chick starters. Here is chicken feed that usually costs only "chicken feed" . . . but means healthier birds, better layers, extra dollars in your pocket!

Thank the advertiser for that. Then apply the lesson to your entire existence.

All year round, you shop for shingles, work-pants, underwear, fertilizers, fencing, seeds, machinery. You want the best and the most for your money. You want to know how you can safely save a few cents—or how you can spend a few extra cents and get more in return.

When you're deciding questions like that, think of what you have read in the advertisements in American Agriculturist.

Grange Gleanings

(Continued from Page 2)

One Past Master, Frank Rumsey, gave a reminiscent account of the history of the organization. State Secretary Harold Stanley of Skaneateles was a guest. He outlined some of the Grange's past achievements and some future objectives.

PENNSYLVANIA Granges this year will stress "Community needs and possibilities" in their home economics program. A very comprehensive layout has been scheduled, calling for hundreds of Grange meetings to be followed by definite Grange programs for improvement.

CONNECTICUT'S newest Grange hall will be dedicated April 27. It is the attractive home of Victory Grange in the western part of the state. This Grange lost its hall and contents in the hurricane of last September, but speedily purchased an abandoned church, remodeled it to meet Grange needs, and now has a comfortable and well-equipped home.

NEW YORK State Grange continues this year the custom of presenting a Grange history as an award to Granges which make certain membership gains. The book in question covers very completely Grange events in the Empire State for nearly three-quarters of a century and is published by the State Grange historian, L. L. Allen of Watertown.

ANOTHER NEW Grange hall in Massachusetts—the proud possession of Essex Grange in the northeastern corner of the state. It was recently dedicated with appropriate exercises, which were attended by a great congregation of Patrons from both Massachusetts and New Hampshire.

Soil Fertility Contest Winners

(Continued from Page 9)

cases answered incompletely. The judges gave credit to answers mentioning the addition of lime and fertilizer, but gave greater credit to those who also mentioned rolling, controlled grazing, the spreading of droppings, and the mowing of weeds and grass.

The other questions were, in general, answered very well. Answers indicating

"Don't be alarmed, Jessie. Those are them new solid nest eggs Old Bull is stealin'."

a judicious mixture of scientific information and experience received the best rating. A considerable number of answers indicated a misinterpretation of scientific facts, showing clearly that this information had not been modified and adapted by practical experience. On the other hand, an occasional answer erred in the other direction in that the writer depended entirely upon personal experience which, in some cases, was directly contrary to the scientific evidence. Unfortunately, quite a number of entries gave excellent answers to the majority of questions and then fell down badly on one.

Many of you who sent answers added comments telling how much you had enjoyed the contests and how much you had learned from it. That is the chief reason for these contests.

Down the Alley

(Continued from Page 11)

Aberdeen-Angus Breeders' Association, and the Animal Husbandry Department of Cornell University. This is a grand beginning of one of the things that the Northeast sadly needs, and that is, a place where men can go and buy with confidence exactly the type of animal which they want. I hope that not only the New York State College of Agriculture, but every State College of Agriculture will increase these sales to the point where they will take in every class of livestock for breeding purposes. This sale on May 8th is deserving of the support of every man interested in beef production in the Northeast.

As encouragement to young farm people, I heard a real authority say a few weeks ago, that right now was the best opportunity the young man has had in the past twenty years to start farming. He also said that any young man in the Northeast would be successful farming if, every morning when he woke up, the stock in his barn was just a little better than it was when he went to bed the night before (that deserves buying and selling thought); secondly, if he produced an over-abundance of alfalfa or other legume hays, and third, if he kept off the roads. Perhaps he was basing this decision on the fact that the Federal Land Bank in 1938 sold a good many more acres than they took in, that the Northeast has one person in seventeen engaged in agriculture as compared with one in three for the rest of the United States, that its population is 212 persons per square mile, with thirty-four for the rest of the United States, or 20.2% of the total population of the United States. It has 48.2% of the money of the United States; its average farm dwelling value is \$2,449.00 as compared with \$1,141.00 for the rest of the United States. It has 53% of all the telephones, 49% of its farm homes have running water, as compared with 14% for the rest of the country. For these last optimistic figures, am indebted to Mr. Thomson, President of the Federal Land Bank, at Springfield, Mass.

Say you saw it in AMERICAN AGRICULTURIST.

Eggs Have Everything!

by
MRS. GRACE WATKINS LUCKETT

IN SPITE of its humble familiarity, the egg still remains near the head of the food list. It has just about everything—eye appeal, is easy to procure, to cook and to digest, and is so versatile that not only can it appear at any meal, but is capable of serving either as the main dish, as chief blender of other foods, or can be made into delectable desserts.

And when it comes to food value, you have to take off your hat to the egg! Every time you eat one, you get body building material consisting of minerals, vitamins, and highest quality protein. Eggs are rich in vitamins and they contain large amounts of iron and phosphorus. So "an egg a day" should be the motto of everyone who wants good health—and who doesn't want it?

The main thing to remember in cooking eggs is that they are a protein food and need to be cooked with as little heat as possible. High heat, or too long cooking, toughens them and makes them less digestible. Therefore when cooking an egg in water, let simmer rather than boil.

Hard-cooked eggs may be used in almost numberless ways. Creamed eggs are simply hard-cooked slices of eggs, heated in white sauce and served on hot, buttered toast. To prevent the dark unattractive ring which sometimes forms on the yolk of a hard-cooked egg, cook eggs below the boiling point not more than 15 to 20 min. and cool promptly by dropping them into cold water. To curry eggs, add a bit of curry powder to the sauce, but not for the children's portions of course.

CREAMED EGGS

A quick and delicious way to cream eggs is to empty a can of creamed mushroom soup into the top of a double boiler, put in hard-cooked egg halves and heat over hot water. Serve on toast, in patty shells or on cooked noodles.

Another interesting sauce to serve over hard-cooked eggs is

HORSERADISH SAUCE

1 tbsp. fat
1/2 tsp. flour
1/4 cup horseradish

3/4 cup top milk or cream
1/8 teaspoon salt
1 teaspoon sugar

Melt fat, add flour, seasonings and horseradish and stir until well blended. Add milk and stir constantly until thickened. Then simmer about ten minutes. Taste and add more seasonings if necessary. Thin with milk or water if sauce becomes too thick.

The backbone of many a supper is egg salad, but it should never be allowed to become tiresome because of being served always in the same old way:

EGGS IN A NEST

Prepare devilled eggs, using your favorite seasoning for the yolks. Pin the 2 halves together with wooden skewers or toothpicks. Line a large salad bowl with crisp shredded lettuce

or watercress and fill this nest with the devilled eggs. On each egg place a bit of pimento and tuck in some radish roses. Have a bowl of mayonnaise near if anyone wishes it.

EGG AND SALMON SALAD

Allow one hard cooked egg per serving. Cut each egg lengthwise into 5 pieces and arrange them, points outward, on the lettuce leaf. Between the pieces of egg arrange wedges of toma-

with mashed baked beans; hard-cooked eggs with chopped, cooked liver; hard-cooked eggs with chopped, cooked bacon; and hard-cooked eggs with chopped, pickled onion.

Salad dressing, milk, sweet or sour cream, melted or softened butter, catsup or chili sauce may be used for moistening and holding the materials together.

But there are other ways to use the egg in sandwiches. Try this one when appetites are hearty:

FRENCH FRIED SANDWICHES

Temperature 350° F. Time: about 30 min.

Sandwiches Eggs, beaten or egg batter Deep fat, or shallow layer

Prepare sandwiches in usual manner (plain, parsley, cheese, meat, etc.) Dip in beaten egg to which 1/4 tsp. salt and speck of pepper and 1/4 c. milk has been added. Or, use batter using 2 eggs, 1 cup milk, 1/2 cup flour, 1/2 tsp. salt and speck of pepper. Cook in fat until nicely browned. If preferred, a shallow layer of fat may be used.

ESCALLOPED SPINACH

(10 to 12 servings)

2 eggs, well beaten 4 tablespoons melted butter
2 cups milk 3/4 teaspoon salt and speck
2 cups cracker crumbs of pepper if desired
2 cups cooked spinach

Mix all ingredients thoroughly, reserving about 1/2 cup buttered crumbs for top. Place in well-greased casser-

American Agriculturist, April 15, 1939

ency. Season to taste. Crisp potato chips in oven and spread with egg yolk mixture. Garnish with bits of parsley and pimento.

PEACH MERINGUE

Place large peach halves, cut side up, into a flat baking dish, allowing half a peach per person. Fill each little hollow with chopped nuts and pour over the nuts 1/2 tsp. maple syrup. Make a meringue by beating 2 egg whites stiff, then beat in 1/2 cup sugar. Either pile the meringue on the peach halves, with a spoon or pipe it around the edges with a pastry tube. Brown in a moderate oven.

PINEAPPLE MERINGUE

Cover slices of pineapple with meringue, sprinkle with shredded coconut and brown lightly in the oven.

SNOW BALLS

4 eggs, separated 1/4 cup sugar
1/4 tsp. flavoring 1 pint of milk Pinch of salt

Beat egg whites until stiff, add salt, then sugar gradually. Heat milk to boiling and place over hot water. Scoop egg mixture up with tablespoon and shape lightly into balls; poach them in the hot milk, and drain on a cloth. Beat yolks slightly, add to the hot milk, stirring constantly. Sweeten the mixture to taste and cook until the

—Photo courtesy of Institute of American Poultry Industries.

to. In the center, put a spoonful of salmon and chopped celery salad. Garnish with a spoonful of mayonnaise. Other egg salad combinations are:

- 1—Two eggs, 1/2 cup sliced celery, 1/4 cup sliced olives, 1/4 cup coarsely cut meats from nuts.
- 2—Four eggs, 2 tablespoons sliced celery, 2 tablespoons sliced olives, 1 pickle chopped.
- 3—Four eggs, 1/4 cup finely chopped onion, 1/4 cup grated cheese, 4 tablespoons vegetable relish.

In these 3 recipes, eggs should be chopped or sliced.

Sandwiches offer another popular use for eggs. Chop hard-cooked eggs, add a little mayonnaise, some chopped parsley and seasoning, and a little onion juice if you like it. This sandwich is equally useful for school children or for afternoon tea.

Here are still further ideas for egg sandwiches:

Hard-cooked eggs with chopped celery; hard-cooked eggs with grated or chopped cheese; hard-cooked eggs with peanut butter (moisten butter with milk before combining with egg); hard-cooked eggs

ole and cover with the crumbs. Bake in a slow oven (325° F.) until crumbs are browned and mixture is set in center—about 35 min.

BACON SOUFFLE

6 slices of bread 2 cups milk
1 cup fried bacon diced 3/4 tsp. salt or more
(1/2 to 3/4 pound) 1/4 tsp. mustard
5 eggs, beaten slightly Paprika

Dice bacon and cook in skillet until light brown. Drain, if bacon is very fat. Use some of the fat to grease a baking dish. Arrange bread in casserole in layers, cutting if necessary to fit the dish. Sprinkle the cooked bacon, seasonings and some of the fat over each layer. Reserve some for the top. Combine eggs and milk and pour over the bread. Sprinkle remaining bacon on top. Cook in moderate oven (350° F.) until puffy and knife inserted in center comes out clean—about 1 hour.

EGG YOLK CRISPS

Put hard cooked egg yolks through sieve. Add mayonnaise or salad dressing to make good spreading consist-

Eggs lend themselves to an almost endless variety of easily prepared dishes. Whether creamed or scrambled, or made into a delicate Welsh rabbit, you need only to add toast and a sprig of parsley to make a nourishing and attractive dish for lunch or supper.

custard coats a spoon. Pour custard over snow balls. For serving, garnish with toasted marshmallows.

APPLE CUSTARD

Yolks of 4 eggs 4 egg whites
1/2 cup sugar 6 tablespoons sugar
2 cups grated apple 1/8 teaspoon grated nutmeg

Beat egg yolks and 1/2 cup sugar together; cook this mixture for 2 minutes over boiling water, stirring constantly. Remove from fire and add gradually the grated apple. Pour into a buttered serving dish; beat egg whites until stiff, add 6 tablespoons sugar and spread over the custard. Bake in a moderate oven until meringue is brown.

SUNBEAMS

By LALIA MITCHELL THORNTON

I move that sunbeams should be kept outside;
There are some things a housewife wants to hide—
The dust that always gathers on the stair,
The worn place in the Master's easy chair,
The scuffed spot on the newly polished floor,
The finger prints along the kitchen door:
Housekeeping praise is hard enough to win,
What right have sunbeams to come sneaking in!

4, 6, 8, 10 and 12 years. With little daughter growing out of her clothes so fast, mother can keep the supply replenished at little cost, using cotton for every day and silk for "nice". Size 8 requires 1½ yards of 39-inch material with ¾ yard of lace for slip; and ¾ yard of 39-inch material with 1¼ yards of lace for panties.

TO ORDER: Write name, address and pattern size and number clearly and enclose 15c in stamps. Address Pattern Dept., American Agriculturist, 10 North Cherry St., Poughkeepsie, N. Y. Add 12c for a copy of our new spring fashion catalog. It contains smart, easy-to-make patterns for all members of the family.

Today in Aunt Janet's Garden

Prune Roses Early

I HAVE been scolded for not writing more about roses, but I have reasons. The main reason is that I do not have enough ground to devote a separate portion of it entirely to roses where they could have the soil prepared and maintained according to the way they like it, and where it would be easier to give the roses their ten-day treatments of spray or dust with sulphur as the chief ingredient. Where this or some equally effective treatment is practiced as a matter of routine, the growing of roses is fairly simple—providing of course one has the hardy varieties to start with.

Just now it is getting pretty late to prune roses, as growth probably will be started. All winter killed branches should be cut back to live wood; and if extra large blossoms are desired, even more severe cutting than that will have to be done. If one likes mor-roses rather than larger roses, then prune lightly. The climbing roses need to be pruned back to live green wood.

Dormant roses are the best and cheapest in most cases, but they should be planted before the first of May. However, the soil should not be damp or muddy. If necessary the plants may be heeled in the ground for a week or so in a shady protected spot until the rose bed is ready for planting.

Potted roses can be planted any time up to the first of July.

For fertilizing the rose bed, shredded cow manure, sheep manure, or a general garden fertilizer will be satisfactory—a trowelful being worked into the soil around each plant. Bonemeal is not recommended for spring application. Wood ashes may be spread to advantage over the rose beds. They are said to have advantage in preventing mildew. Frequent cultivation will help to keep down rose bugs and will yield better flowers. For the benefit of the roses and all other plants as well, all of last year's garden rubbish should be removed and burned—dead stalks, stems or any litter. These may hold disease or pests which the garden would be better without. Particular care is needed to get rid of old hollyhock or delphinium foliage.

Be Smart! Sew!

THE home dressmaker still has plenty of room to exercise her art in spite of the great number of ready-mades in the market. Besides that extra touch of individuality which she can give her garments to distinguish them from the mob, they are better quality and better finished—and at less cost.

DRESS PATTERN NO. 3033 may echo spring's freshness in one of the new prints or may be very smart and dignified in navy blue or black. The luscious new shades in monotone crepe offer other possibilities. It is extremely easy to make and comes in a wide range of pattern sizes, 16, 18, 20 years, 34, 36, 38, 40, 42, 44, 46, 48 and 50-inches bust. Size 36 requires 3 yards of 39-inch material with ¾ yard of 35-inch contrasting.

PRINCESS SLIP and PANTY PATTERN NO. 2605 is designed for sizes

PERFECTION

is the word for it!

Modern PERFECTION OIL RANGE NO. R-868

FAMOUS HIGH-POWER BURNERS—give intense, instantly-regulated heat. No soot, no odor. And so much more economical than piped or wired fuels!

"LIVE-HEAT" OVEN! Your baking is completely surrounded with moving, heated air. A feature every good cook raves about. And there's a built-in heat indicator, too!

YOU CAN AFFORD ONE! Ask your Perfection dealer how easy it is! A small amount down, and a little a month will buy yours. High-Power Perfections cost from \$20.50 up.

LETTERS

40 Sanger Avenue,
Waterville, Maine,
January 6, 1939.

Dear Mr. Weatherby:

Thank you for your Company's draft of \$50.00 to pay for the time I was laid up unable to work since my accident.

I shall be very glad to give you my permission to publish the following in the *American Agriculturist*.

My family and I are greatly satisfied with the assistance that the North American Insurance Company has given me for my recent accident. I recommend this company to all others who wish to buy accident policies.

We hope that this letter will be of some help to you and your company in getting other people to take out policies.

Sincerely yours,

NAPOLÉON J. RANCOURT.

* * *

Ransomville, New York,
January 30, 1939.

Dear Mr. Weatherby:

In reply to your letter of January thirteenth, I wish to state that I have received your draft for \$130.00 for the time I was laid up unable to work.

I wish to issue my congratulations for your promptness in settlement. As a policyholder and receiver of this amount I feel it my urging duty to write this letter as proof of my deep appreciation to the North American Insurance Co. You have my permission to publish this letter which I hope will encourage others to take advantage of this reasonable protection.

Thanking you again for your kind and prompt services.

Very truly yours,

REXWELDT GEARTZ.

* * *

Fayette, Maine,
January 11, 1939.

Dear Sir:

Mr. Brown has delivered my check for \$50.00 today. I appreciate very much the help I have received for such a small investment.

My reaction is that anyone that passes up such an opportunity must be foolish, or have more money than they know what to do with.

You have my permission to use this letter in your magazine. It may be some help not only to you but the people who read it.

Yours very truly,

MERLE G. BARRON.

MUFF—A Serial Story

By C. A. STEPHENS

THE STORY THUS FAR

Muff's real name was Henry Nemo, but the name "Muff" stuck because his mother tucked him into an old muff when he was a few days old and abandoned him on the doorstep of the home of two old maiden ladies. Against their desires, the Selectman persuaded Mary and Marcia to keep the boy. As he grew, a crimson birthmark around his neck was noted by the village gossips and referred to in whispered tones as "the gallows mark". On reaching school age, Muff was a silent boy. He developed a great ability to train animals, first evidenced by his training an old gander to drive the family cow home from pasture.

* * *

AS I have said, Muff seemed at no pains to teach the gander, yet the lad had a peculiar gift of getting the ascendancy over animals,—the gift of understanding them and their ways, and of making them understand him, as will be seen from the still more remarkable instance which I give below.

There is a very pretty little animal common throughout the United States, but which, from certain natural qualities, is very unpopular; so much so, indeed, that even its name is often an offence to fastidious ears. For this reason I will use a part of its scientific name; MEPHITIS.

Almost every kind of a wild animal has been tamed and kept as a pet, but I chance to know of but one person who has even tamed a mephitis and lived on safe terms of familiarity with it, and that one was Muff. It came about in this wise:

One morning in February, Muff found one of these creatures in one of his goose-boxes in the cow-barn. Most boys of thirteen would at once bombard the goose-house with stones or stove-wood; but Muff first reconnoitered the animal very quietly, then by a series of feints drew it out in pursuit of him. Thus, partly luring and partly driving it, the lad got it away from the cow barn and along the road for fifteen or twenty rods to an old pound.

But I shall have to explain what the "old pound" was. In New England towns it is, or rather once was, customary to have centrally located a strong walled enclosure, to which trespassing cattle, horses, or sheep, could be driven and enclosed 'till the owner could be notified to take them away, after the payment of charges, or damages, as the case might be. These yards were called "pounds". The people of the town elected every spring a field-driver and a pound-keeper.

The pound at the Corners was in the side of a gravel-bank among low pines. A great amount of gravel for the highway had been taken from the bank, leaving a space enclosed on three sides by the earth and at the top overhung by a fringe of turf and roots. A high stone wall, with a gate along the side next the road for eighty or a hundred feet, completed the yard.

Muff succeeded in getting the mephitis into this yard. Instead of killing it, he took a fancy to keep it there alive; so he repaired the old gate, and put boards along the wall in such a manner that it would not get out. His kindness went even further; he gave it an old goose-house to live in, and undertook to feed the animal.

In about a week after Muff had put it in the pound he found that the old goose-box was full of young mephitis.

There were, I think, six or eight of them. I saw them a week later—One or two had died—and, prejudice aside, they were as beautiful little creatures as I ever looked upon; and I have seen little pine martens and fox cubs and

the puppies of the wild Australian dingo, which are about the most roguish, wide-awake little creatures imaginable. These mephitis had little pink noses, and were curiously marked in jet-black and snow-white. As for their mother, although we visitors did not dare to approach her, Muff would push her about with his bare hand, without unpleasant consequences, and the place had no disagreeable odor.

Muff kept these youngsters until they were grown—all summer in fact. The family multiplied in time; at one time he had twenty. Old Marcia complained that they used all the eggs his hens laid to feed the animals; but he realized considerable pocket money from their skins, which were then worth a dollar apiece. It is a fact that the boy had those animals under such control that he would go among them, and even take them out of their burrows in the gravel bank.

An amusing incident is connected with Muff's flock of mephitis in the old pound. There lived at the Corners an habitual drunkard called "Raish" Goodnow; that is to say, he was as habitual as he could be, under the stringent prohibitory liquor law of the State. Every few weeks he would contrive to go "on a spree", 'till the rum he had obtained was gone.

Early one morning in October, he was found by Muff, sitting on a log not far from the old pound. He had not been sober for nearly a week, and, while wandering about the previous evening, had fallen down the bank among the mephitis in the old pound. The poor inebriate had evidently had a terrific experience. Three of the mephitis he had killed, but they had inflicted awful reprisals upon him.

He had at length found his way out of the pound. When Muff discovered him, he was quite sober; but in a dreadful state from nausea, and from his encounter with Muff's pets. Medical assistance was called, and the doctor declared that he had come near dying. That he had been sobered completely, and at once, when from all accounts, he had drunk enough rum to last him a week, may be a fact of interest to gentlemen of his social standing when

Change

Into a loaf of bread
We shape the wheat
Which yesterday was nodding in the field
With golden head.

Into a glass of wine
We press the grapes
Which yesterday were purpling clusters
On tangled vine.

We hoard as gold today
Our memories
Of winging dreams which yesterday
shed life
Along our way.

—Kathrya Kendall,

4030 41st Ave., S. W.,
Seattle, Washington.

they wish immediate recovery from a debauch.

The town had Raish's doctor's bill to pay; and indignant at this, the selectmen notified Muff that he must dispose of his "pets" at once. The boy, of course, did so, and encountered a great deal of chaffing about it.

THIS same autumn he exhibited a yoke of trained steers at the fair which came off a few days later; and so much admiration was excited by this latter performance that the mephitis business was forgotten. Even after a lapse of thirteen years I find that those yearling steers, little "Star" and "Turk" are well remembered, not only at the Corners, but throughout the county, almost as well as "Uncle Solon Chase's" famous steers. Star was Old Grissley's calf; the other, Marcia had bought for Muff from Deacon Willis, or rather of Aunt Sally, the

The Song of the Lazy Farmer

S.
4-8

OF ALL that Nature does for man there ain't another thing that can be equal to a rainy day; I like to lie upon the hay and listen to the patter of the raindrops on the roof above. There's allus such a rush in spring, a feller works like ev'rything to git his seed into the soil, each day is just a round of toil. A feller gits himself tired out, no matter if he's big and stout he gits to feel he'd like to keep himself in bed and sleep a week. There ain't no time to sit and think, and slink out to the barn to we wake before it's light do each chore, while work just piles up more and more, until, although we do our best, there just ain't any time to rest.

But when it rains, why I just sit and git enjoyment out of it, the steady patter of the rain makes me forgit each ache and pain, I just stretch out upon the hay and hope that it will rain all day, or mebbe for a week or so, for when it stops I'll have to go to work again,

but for today I'll only while the time away a-restin', with a sense of peace, a-hopin' rain will never cease. The grass is freshened by a shower, it grows a week's worth in an hour, the seed that's in the soil will sprout and little shoots come peepin' out. Rain's Nature's blessing on mankind, it washes worry out our mind, it gives us rest and when it's o'er we're ready for our tasks once more. Of all the things in life, I'll say the finest is a rainy day!

deacon's wife, who had herself reared the calf on skimmed milk, and who exchanged it with Marica for four young geese.

Muff had begun to train them the fall they were calves. He made a little yoke for them with a tiny staple and ring; and during the winter, he often exercised them in drawing a small wood sled with a few armfuls of wood. In the spring he made a cart for them. We used often to see him going back and forth to the store.

During the summer, Mr. Murch, who was a great admirer of well-trained oxen, told Muff to go ahead and get the steers nicely handy, and take them to the fair.

On the forenoon of the second day of the fair, Mr. Murch, who was one of the committee on such exhibits, mounted an ox-cart, and in his stentorian tones, announced that little Muff Ransom would now show his trained yearlings ("yellins", Mr. Murch pronounced it); and then Muff came riding through the crowd into the ring in his little cart.

Without dismounting from the cart, he rode round the ring. At the single low word "Haw", the steers would turn the cart to the left, or if Muff said "Gee", they would turn just as surely to right. "Back", said Muff; and then those little fellows backed that cart with Muff in it clean around the ring.

But Muff wasn't done.

Dismounting from the cart, he un-

yoked the steers, and then showed that he could drive, "haw" "gee", and back them equally well without a yoke. The steers kept side by side, and went through all the exercises at just a word from their young owner, or a motion of his hand. He did not touch them with a stick.

But it was when Muff trotted and galloped the steers with the cart, that the most fun was raised, particularly among the boys. For they trotted, or ran, as evenly and finely together as a span of matched horses. Yet when going at full speed, Muff had only to call out "Whoa-hish!" and they would stop short, and back the cart just where he bade them.

Old Marcia was beset with offers for the steers; and she at length accepted eighty dollars for them. Ordinarily steers of that age would have brought not more than twenty-five.

It is safe to say that Muff was the most popular boy in the county that day, and every one was saying what a wonderful gift he must have.

It was, as it chanced, his thirteenth birthday.

I mention these facts of Muff's patience and skill; for I have always been inclined to doubt whether a really bad boy could thus gain the confidence and good will of animals; and I hope to win in advance the reader's sympathy for this nobody's boy, since in the next chapter I have something very sad to relate concerning him.

(To be continued)

BATAVIA Shows the Way!

(Continued from Page 1)

man has in common with the farmer. He owns property; so does the farmer. He is an employer of labor; so are many farmers. He believes in the American way of doing business; so does the farmer. Because the farmer is a property owner and employer of labor, he is conservative. He stands fast on the principles upon which this country was founded. The farmer does not believe in either individuals or nations spending their way out of a depression. The farmer knows that when he accumulates anything it comes from hard work, good business judgment and, above all, economy. Therefore, in common with the business man, the farmer is against all the "isms" except Americanism. The farmer is not opposed to sound, conservative labor organization, for he believes in organization himself, but being a producer of perishable products he is opposed to radical labor organization, and to such un-American procedures as sit-down strikes.

As to what a business man or a group of business men can do to help agriculture in general, and the dairy industry in particular, I made the following suggestions at the meeting and repeat them here:

1. Get Acquainted with Farmers.

Acquaintance with the farmer and his problems means understanding, without which no progress whatever can be made.

2. Stop Critical Talk of Farming and Farmers.

Don't say, for example, that farmers are inefficient. Of course some of them are, but the majority are just as efficient as the rest of us. Don't say that farmers ride around in automobiles too much. Some of them do; some of you sold them the automobiles. Farm folks have just as much right to automobiles and the other good things of life as the rest of us, and besides, an automobile is a farm tool, used in the farm business.

3. Don't Criticize the Farmer's Organizations.

Most of them are good, some are not. You are probably not close enough to the situation to tell which is which. If

a farmer's buying organization competes with your business, the best answer is to show your farmer patrons that you can do a better job and a more efficient job than his cooperative. But the way to do this is to show them, not tell them. Don't believe the man who says a farmer's selling organization is crooked. Maybe your informant is crooked himself or at least has a selfish motive.

4. Find Out What a Majority of the Farmers Want and then Get Back of it Without Reservation.

To be sure, farmers are not 100 per cent for anything, neither are business men, but there were 85 per cent of the farmers back of this milk order. That was a majority, and enough to justify any business man's support.

5. Join with Farmers' Organizations in Programs to Take Government Out of Business and Agriculture, Reduce Taxes, and Maintain Fundamental American Principles of Liberty and Freedom of Action.

6. And Lastly, Avoid the Anti-Farm Gang as You Would Avoid the Devil.

For more than a quarter of a century, every time farmers have attempted to do anything, the anti-farm gang has gotten busy and tried to tear them apart and the plan to pieces. This anti-farm agin-everything gang was solely responsible for the failure of the pres-

ent milk marketing plan, with its ensuing loss of millions of dollars to the agriculture and business of this state. Any aid and comfort given to this gang is traitorous to farmers and to business men.

Who Are the Gang?

1. In the anti-farm gang are a minority of the milk dealers, the chiselers, some of whom would murder their grandmother if there was any profit in it. A majority of the milk dealers are constructive. They tried to support this marketing plan, they signed up the voluntary agreement, but they, and the good farmers, and you business men were licked because of a small minority, many of whom were unscrupulous in their fight to defeat this plan.

2. In the gang are a few lawyers, who have battened and fattened for many years on the troubles in the milk business. Law is an honorable profession, but the dirty hand of the lawyer trouble-maker, almost of the shyster class, was mixed in this deal to destroy the farmer's and the business man's income from dairying.

3. In the gang are a very few politicians of the demagogic type who, because milk is an emotional subject, use it as a stepping stone in realizing their own selfish aims. I must add that the very great majority of the political representatives of the public are constructive and helpful in trying to help solve the milk marketing problem.

4. In the anti-farm gang are also one or two publishers, who use the power of the press to create suspicion and dissension and thus tear down the farmers' efforts to help themselves.

The press as a whole, including especially the great newspapers of the state, have constantly carried fair and accurate news stories about the milk situation, and many of the newspapers give fine editorial support to farmers' efforts to help themselves through joint action. When all of us, including both farmers and business men, recognize this anti-farm gang as our common enemy, and refuse to believe them, then and not 'till then will we make some progress in this marketing problem.

As against these trouble makers, I suggest belief in and cooperation with the constructive forces of agriculture, every one of which lined up for the Rogers-Allen Law and Federal marketing orders and for the whole milk marketing plan, which worked so successfully during past months. Among these constructive forces are the New York State Grange, the New York State Federation of Farm Bureaus, the State Horticultural Society, the State Vegetable Growers, the Home Bureau Federation, the New York State Conference Board of Farm Organizations, consisting of all the large farm organizations of the state of New York, the *American Agriculturist*, the New York State Legislature, and the entire state government, and the United States Department of Agriculture.

In recent years I have been pleased to see the great interest and sympathy on the part of business men for their farmer neighbors. Service clubs like Rotary, Kiwanas, and Exchange have done much to bring about better understanding between agriculture and business. But the Batavia business men have so far done the best job of all, and I urge every business man and every one of his organizations to follow the lead of the Batavia Chamber of Commerce, first, to learn the facts about our most important business, agriculture, and, second, to organize business back of farmers' efforts to help themselves.

At the same time, I suggest to my farmer friends that we in agriculture are just as dependent upon business as business is upon us. Let us meet all efforts of cooperation halfway, for with business and agriculture marching together, final success for both is assured.

Kernels, Screenings and Chaff

By H. E. BABCOCK.

I AM afraid that this page is going to be pretty well dominated by mules. I suppose that it is characteristic of me to give way to enthusiasms. Well, so did George Washington. Read what he thought of mules elsewhere on this page.

ECONOMICAL POWER UNITS

After having made a resolution to keep out of owning horses because of the very low prices at which they have been selling, I have gotten back into the game with the purchase of some horses and a pair of mules to boot.

I reason this way: Good horses are selling for one-third less than we have been selling them. If farm prices are going to continue low, however, farmers will simply have to use more hay and oat burners. If farm prices go up, good teams will go up with them. Meanwhile, it isn't going to cost much to carry young horses along. Am I thinking soundly?

* * *

George Washington on Mules

(From *A History of Agriculture in the State of New York*, by Ulysses Prentiss Hedrick)

"Probably there were mules in the New World before Washington's time, but it was Washington who popularized this animal in Virginia and the South, whence they were dispersed in small numbers to the North.

"From someone in the Revolution, Washington learned about asses and mules, and came home from the war filled with enthusiasm for jacks, jennies, and their crosses with the horse. He wrote to Spain to procure permission to buy a jackass of the best breed. The King of Spain took the opportunity to send the great American general two jacks and two jennies. One of the jacks died on the way over. The other three animals reached Mount Vernon in December, 1785. The surviving jack was named 'Royal Gift', and soon became famous. Washington was immensely pleased with the animal. Soon Royal Gift was sent on a tour of the South, and Washington records in his diary that the profits of the tour brought him \$678.00, but that the jack came home lame, thin, and debilitated.

"Lafayette also learned of Washington's fondness for jackasses and mules, and in 1786 sent him from the Island of Malta another jack and two jennies. The new jack was named 'Knight of Malta.' Lafayette's animal was a smaller beast than Royal Gift; his ears measured but 12 inches; he was also more vicious with his teeth and much handier with his heels. It is probable that the modern mule's ability to use his heels is an inherited characteristic from the Knight of Malta. Washington crossed the two strains of asses and obtained the jack, 'Compound.' Compound had the size and strength of Royal Gift and the activity of the Knight of Malta.

A pair of jacks and a queen.

"From Washington's jacks most of the mules in America have descended. Mrs. Washington complained bitterly of their braying, but to the General the voice of an ass was jubilant, joyous, musical, mellifluous. Washington wrote to Arthur Young, 'The mule is a very excellent race of animals, cheap to keep and most willing workers.' He bred from Royal Gift draft mules, and from the Knight of Malta beasts for the carriage and saddle. To a friend he wrote, 'In a few years, I intend to have no

other animals for carriages and saddle.'"

* * *

A Modern Farmer on Mules

"I presume that you are more interested in mules than when I talked with you, as I noticed that you bought the sorrels at Rumsey's sale. If they are as good as they look you will not be sorry.

"I bought our first team of mules five years ago. They were western bred and broke. Since then I have bought seven little colts and have them all to date. Since we got started I have broken a

pair every winter. The first pair of colts are four, the second pair three, and this winter I have handled the two-year olds. We have only one yearling. The first two pair that we raised match very well, but the two-year olds do not match so well. However, I think that the yearling will match the largest one very well when he gets his growth.

"I have found that one of the most essential things with mules is to turn them loose in a boxstall or pen when not in the harness. This saves a lot of stable work such as bedding, cleaning, and grooming. If the pen is well bedded they will take care of the grooming to a large extent. They will carry more flesh on less feed under these conditions than when kept in stalls. A watering trough in the pen also saves a lot of work. Mules will never drink much when sweaty.

"One need not worry about their hurting one another when they are not sharp shod. They will kick one another, but they seem to use a lot of judgment with it.

"We do not keep our mules shod. Their hoofs are very tough and hard and never get tender under the conditions that we have on our farms today. It is true that there are times in the winter that we could draw a little manure if they were sharp shod, whereas we have to wait until the ice breaks up or is covered with snow. We have found that this is quite a saving in operating expense.

"Speaking of their not hurting one another, we often turn nine of them in a pen that is 24' x 40'. They range in age from thirteen to one year.

"Mules are naturally very hard on fences; but the electric fence is very effective. Sometimes the wire gets down to within a foot of the ground, but they never step over it. And once they have been fenced with electric fence they don't seem to bother any wire fences.

"Many people who have not had experience with them seem to think that all mules are contrary and vicious. This is absolutely the opposite from my experience. I do, however, believe that they should be broken and used a little when they are two years old.

"They respond very well to kind treatment and resent mis-treatment. By this I do not mean that they should have their own way, but on the contrary, when one is breaking a mule he always wants to make them mind and do as he wants them to. If they win the battle once it is many times harder to get over the same point the next time." — Alton L. Culver.

Hank went to an auction the other day and looked down to see if his shoe-lace was tied. When he raised his head we owned a pair of mules. At least that is Hank's story and as far as we at Sunnigables are concerned, it is O.K. with us, for Jack and Sandy, shown at the top of the page, have completely won our hearts. We have decided that they are just what we want along with our "tractor" for motive power at Sunnigables.

I am told that Jack (above) was second prize mule at the New York State Fair last year and that he and Sandy were third prize span of mules. Whether or not they won these honors, they are welcome at Sunnigables and are going to stay there.

Annual School Meeting Soon

May we remind you that the first Tuesday in May, which this year falls on May 2, is the date of the annual school meeting in common school districts in New York State. The most common question which has come up in recent years concerns the qualifications for voters at school meetings. Voters must be:

1. United States citizens.
 2. At least 21 years old.
 3. A resident of the district for at least 30 days preceding the meeting.
- In addition to these three qualifications, voters must have at least ONE of the following qualifications:

Must own, lease or hire, or have contract to purchase real estate taxable for school purposes. In case of a joint deed, both owners may vote;

OR be the parent of child or children of school age who attended the school where they are voting for at least eight weeks during the year preceding the meeting (under this provision, both parents may vote);

OR have permanently residing with him or her a child or children of school age who attended school in that district at least eight weeks during the year preceding the meeting ((under this provision, only one person can vote—the head of the household);

OR own personal property assessed on the last assessment roll of the town for at least \$50.

Persons who have the first three qualifications and one of the last four special qualifications can vote on any question brought up in a school meeting.

If there is any question about the right to vote, any voter can challenge the vote. Then the one challenged either refrains from voting or declares, "I do declare and affirm that I am and have been for thirty days last past an actual resident of this school district and that I am qualified to vote at this meeting." If the voter makes such declaration, his vote must be accepted; but anyone who willfully makes a false declaration is deemed guilty of misdemeanor and in addition forfeits \$10 to be sued for by the Town Supervisor.

No "Hybrid" Oats

Ford Prince, head of the Agronomy Dept. of the University of New Hampshire, states that enthusiastic seed salesmen are using the term "hybrid oats" in attempts to impress farmers with the value of the seed offered. Oat plants are self-fertilized and not cross-fertilized as is corn. Therefore, it seems apparent that the use of this term in connection with oats is definitely misleading and used as bait to influence farmers to buy. The advice of Mr. Prince to avoid biting, while directed at New Hampshire farmers, is equally good for others in the Northeast.

* * *

Branded "Fraudulent"

Fraud orders have recently been issued denying the use of the mails to the Hollywood Star Products, Los Angeles; A. E. Lueck, Kenora, Canada; and the Chicago Thermo-Magnetic Cushion Co. Hollywood Star Products sold tablets supposed to reduce those who are overweight. They were found to consist essentially of a group of laxatives plus iodine.

A. E. Lueck advertised a sensational discovery to grow hair on the balding head. Those sending \$2 received directions for preparing a mixture of honey, cocoa, lard and sulphur, with instructions to take a tablespoon twice a day!

The Thermo-Magnetic Cushion Co. advertised its product as a treatment

for practically all body ailments. A test indicated that its effects were essentially the same as those of a hot water bottle.

Of much value are the orders of the Post Office Department denying the use of the mails to companies proved to be fraudulent. However, it seems to us that the best way of putting such companies out of business is for the public to get wise to them and to stop patronizing them.

* * *

Mexican Divorces

The Post Office Department has recently issued fraud orders against various attorneys or alleged attorneys in Mexico who have advertised in publications circulating throughout the United States offering to secure Mexican divorces through the mails for residents of this country. The Solicitor of the Post Office made a finding to the effect that these "attorneys" secured fees from "clients" in the United States by means of fraudulent representations. The Solicitor declared: "Persons securing these so-called Mexican divorces through the mails through Courts wholly lacking in jurisdiction over the parties do not secure divorces valid in the United States."

Let the Butcher Pay your Seed Bill

THE PRICE OF MILK COWS hit the toboggan about the same time that milk did, but the butcher is still paying pretty good prices for culls. The plan suggested on this page two weeks ago continues to look like a sound one—get rid of all the old cows, blemished cows, non-breeders, aborters, and poor producers in the herd and use the money for—

1. Grass seed
2. Lime and superphosphate

The coming of pasture will help out on feed costs, but it isn't going to do milk prices a bit of good. Don't let poor cows eat their heads off on grass that the good cows need.

Cows that are worth keeping are worth feeding. Even on flush pasture, they should have some grain to keep them in good flesh and condition. For cows on very good pasture, 13% Fitting Ration provides

enough protein, but 18% Legume Dairy costs the same, and is higher in T.D.N. and in fat. 18% Cow Feed is substantially lower in cost, but is also lower in feeding value.

The point to keep in mind during this period of low milk prices is that **cooperative action remains the best way of purchasing feed.** G.L.F. mixes feeds to fit the need of every dairyman and every cow in the milk shed.

The Super Feeds—Fixed formulas, very high quality.

The Approved Flexible Formula Feeds—18% Legume Dairy, 20% Exchange Dairy, 24% Milk Maker, guaranteed to contain at least 4% fat. High in quality, high in T.D.N., but economical because of flexible formulas.

The Lower Priced Feeds—Cow Feed, 18%, 20%, and 24%. Lower in fat and in T.D.N. than the approved feeds, but equal in quality to any feeds sold at comparable prices.

Few Service Agencies carry all these

feeds, but every agency will be glad to handle the one that fits your case. Talk it over with your store manager or agent.

GRASS IS CHEAPEST FEED

27 cents of every dollar the average dairy farmer spends for farm expense goes for feed; only 4 cents goes for seed, lime, and superphosphate. That 27 cents can be cut to 20 cents or less in a good many cases by spending a cent or two more in laying the foundations for better pastures and hay.

A sound move at any time, this is especially practical right now when it can be financed by (1) the sale of cull cows; (2) Agricultural Conservation payments.

To every dairyman interested in reducing his production costs, G.L.F. earnestly recommends that he see his Service Agency about spring requirements for seed, lime, and superphosphate; and discuss with his Agricultural Conservation committeeman the practice payments for which he may be eligible.

Cooperative
G.L.F. EXCHANGE, INC.
ITHACA, N.Y.

DOING WELL, THANKS...

Hatched in January, these two young ladies average a little over 2 pounds apiece. Their legs and beaks are bright yellow and their feathers are smooth and glossy. From the very first they have crowded the feed hopper and consumed their feed with a relish. At nine weeks they had eaten 6 pounds of G.L.F. Starting & Growing Mash and about a pound and a half of scratch grain. Even then they tipped the scales at a pound and a half.

There are three good reasons for the healthy progress of this flock and for many of the thousands of flocks successfully raised on G.L.F. Starting & Growing Mash every year. The feed is one. Careful management that looks to sanitary conditions and correct heating is another. The third is good heritage. The parents of these birds were free from disease, were well handled

and were fed G.L.F. Super Laying & Breeding Mash. Like mother, like daughter—these birds will be switched to Laying & Breeding Mash about twelve weeks from now when they start to work in the laying house.

FIVE YEARS FOR \$3.00 — THREE YEARS FOR \$2.00 — PUBLISHED EVERY OTHER WEEK

COWS SAY "OK" to GRASS SILAGE

A cutter in a trench to eliminate lifting green grass or legumes, and equipped to add phosphoric acid to the green material by gravity.

Left: Loading soy beans on a truck fitted with a dump body.

Cutting soy beans with a windrow attachment which eliminates raking.

THE BIG increase in the use of grass silage is no accident. There are good reasons why farmers are interested and why more of them are trying out this new practice each year.

Most dairymen will agree that hay should be cut early, but tricky weather interferes with plans and puts off cutting of thousands of acres of hay beyond the time when it is most palatable and nutritious. Putting grass into the silo takes the weather hazard out of haying. Not only can you "hay it" during a rain if you are so inclined; you can also avoid spoiled or partially spoiled hay that cannot be cured because one shower follows another at irritating intervals.

Hay silage provides a practical adaptation

of the ever-normal-granary idea. Good succulent roughage can be put into the silo in early summer and fed to the cows when pastures are dry later in the season. It takes one of the headaches out of pasture improvement. Pastures can be fertilized, and if the grass gets too luxuriant, it can be cut and put in the silo. Shortly, new growth will be ready for the herd.

Putting grass into the silo fits right into the soil conservation program. Less plowing and cultivation are necessary, and everyone knows that erosion troubles pass over fields that are in grass.

To the man who must build, there is another advantage. You can get fourteen pounds of dry matter in the form of grass silage into a cubic foot of space, as compared to four

pounds in the form of hay. This raises the possibility of constructing one-story cow stables with silos for holding roughage. This in turn reduces the farm fire hazard. Last, but by no means least, grass silage improves the color and flavor of winter milk.

There are a few tricks that must be learned in order to store grass in the silo and have it come out in a way that will get a hearty "O. K." from the dairy. First, the silo must be tight. If the doors are loose, cracks can be covered with tar paper. Chopping the silage in quarter and half inch lengths makes tight packing possible, and experience shows the advisability of keeping the silage leveled off in the silo, preferably by having a man distribute and trample it.

Between fillings, or when the silo is full, losses can be cut by covering with tar paper or wet bags, or by sprinkling the top of the silage daily for about ten days with enough water to replace that lost by evaporation.

One danger of over-enthusiasm is the possibility of concluding that any kind of a crop will make good silage. That is wrong. Put into the silo only freshly cut green material such as grass or legumes at the proper stage of maturity, which is just about at the blooming stage. High quality palatable silage can only be made from a high quality crop properly handled. A silo doesn't manufacture protein; it just preserves it.

There is one more essential—the addition of a preserving material. Corn keeps in the silo because it contains sugar which changes into an acid and stops fermentation. Grass and legumes are low in carbohydrates and high in protein, and the two materials most commonly used to correct this deficiency are molasses and phosphoric acid.

Sixty pounds of molasses—(Turn to Page 13)

Farmers Urge Passage of Nunan-Allen Bill—See Page 5.

4 ways You Save with Mobiloil

In Car or Tractor
Mobiloil's
Balanced Protection
Saves You Money

YOU "ROB PETER TO PAY PAUL"— when you use oil built to emphasize just one or two good qualities.

You save one way—but the same oil may cost money in others.

That's the reason wise farmers use Mobiloil in all engines...its "Balanced Protection" saves all four ways.

It's refined to resist wear, gum, carbon and the fuel-wasters—"oil drag" and "blow-by"—equally well.

On your farm, don't sacrifice a single engine economy. Use Mobiloil!

MOBIL OIL

A GOOD MAN TO KNOW—

CHARLES M. GARDNER

Editor of the National Grange Monthly and High Priest of Demeter of the National Grange.

Your Mobiloil-Mobilgas Man Has a Complete Line of Money-Saving Farm Products!

MOBIL OIL—gives "Balanced Protection." All good oil qualities—not just one or two.

MOBIL GAS—delivers "Balanced Performance." A scientific blend of every good gasoline quality.

POWER FUEL—special tractor fuel. Smooth, even-burning, powerful, economical.

MOBIL GREASE NO. 2—the all-purpose farm grease. "Half as much lasts twice as long."

MOBIL OIL GEAR OILS—all grades. Highest quality.

KEROSENE—pure, clean-burning. Refined by experts.

WHITE GASOLINE—Finest quality! Clear-burning in gasoline appliances.

BUG-A-BOO—kills insects quickly, surely. Stainless.

SANILAC CATTLE SPRAY—won't irritate eyes or hide. Effective all day long.

He has lower-priced lubricants also—made by the makers of Mobiloil—economical for equipment whose age or condition does not justify the highest grade.

MOBIL GREASE NO. 2 INCREASES SERVICE LIFE OF DISC PLOW BEARINGS

Anti-friction roller bearings are subject to high pressures due to weight and to the angle at which the disc enters the ground.

Mobilgrease No. 2 resists this pressure; extends life of bearings.

CHARLES M. GARDNER

Editor of the National Grange Monthly and High Priest of Demeter of the National Grange.

GRANGERS all over the country are helping to boost the great World's Poultry Congress, which opens at Cleveland, Ohio, July 28, and at which an attendance of more than half a million people is expected. Grange interest is further intensified by the fact that the general chairman of the big show is Prof. James E. Rice, of Trumansburg, N. Y., long a member of the faculty at Cornell University, who is a veteran member of the Grange and for years has been a booster for it. Prof. Rice is a widely-known authority on poultry matters and his selection to head up the Cleveland show is considered an admirable one.

* * *

FORMER STATE MASTER and Mrs.

J. Curtis Hopkins of Rhode Island, who have been spending the winter months at St. Cloud, Florida, have taken an active part in organizing the All-States Grange Club in that city, which has been holding regular meetings the past season, carrying out the general Grange plan of such gatherings. This unique winter project follows the same plan as the All States Grange Club established at St. Petersburg several years ago through the efforts of A. M. Cornell, former lecturer of the Pennsylvania State Grange.

A two-wheel trailer sprayer operated by a power take-off from a tractor.

WHAT TO DO?

By ED. W. MITCHELL
Columbia County, N. Y., Fruit Grower.

SPRING is here, and that means spraying time for the fruit grower. What to do about it is the problem uppermost in every man's mind. Last year our Farm Bureau spray service started on Saint Patrick's day, March 17th, and sent us some 36 spraying letters, winding up with suggestions for sprays to be applied after September third.

Now I do not know exactly what it costs you to grow a bushel of apples, or exactly what your average return may be, but I do know that all of us are spending more on production than we seem to be able to get back, and that spraying is one of the main items of cost.

There is no disputing the fact, that good fruit costs less to sort, pack and handle; there is less waste, and it brings a better price than poor fruit. We also know that dusting or spraying is about the only way we can grow good fruit and that up to a certain limit, good crop protection is cheap insurance. The only question is, how much can we afford to pay for this insurance, and how can we cut its cost.

To get the first part of the answer, how much can you afford, just jot down your average crop and gross return for the last few years, subtract the fixed charges you know you will have to meet, and the balance (if any) should be what you can afford to spend for spray. Another way to get at about the same thing is to count all your money, add what you can borrow, subtract fixed and unavoidable costs and budget the balance for crop protection. In many cases that solves the problem for there is often no balance, and you can direct your worry to other things.

Nevertheless, most fruit growers will spray and dust some. It is one of the miracles of nature how farmers keep on spending money and producing crops year after year when they had no money at the start, and never make any. They will spray their fruit trees, and go hopefully ahead, no matter how badly they have been licked.

That being the case, let's see how we can keep down costs, without risking too much loss from insects and disease. There are only about seven diseases and twenty-two insects that offer a serious threat to an apple crop, and a little gang like that ought not to scare us.

First it is important to keep track every year of the major troubles in your own orchard. What is serious for some other grower may not be a serious problem for you. List all the insects and diseases down the left hand side of a page; across the top draw and date the various stages of development of the tree and buds; down the right side list the various materials used for control. With this data on one page before you, combine as best, you can to use the fewest applications, of the least expensive materials, at the time when you can control the greatest number of pests. If you like crossword puzzles, you will find this a good one to test your skill. If you work it out right, you get a good cash prize.

Last year we started our first application April 19. The first scab infection came the 18th. This was our first mistake. We stopped July 25th and had some scab develop on Baldwins in storage. That was our last mistake for that season. Apparently our spray season was a little short on both ends. What to do about it—only one thing, start earlier and keep up till the day of picking or almost that long. To some extent, all of the applications between the first and last were partly wasted because the control was not complete. It does not make much difference what puts an apple in the cull pile. If we miss one insect or disease that ruins the apple, we might as well miss them all and save our spray. It means just this—we must either put on a complete program and get almost complete control, or stand a good chance of losing whatever we do invest. One worm in an apple is almost as bad as two. If an apple has maggots or scab, it might just as well harbor a couple of worms, it is a loss anyhow. What to do is a real problem, but either make an attempt at complete protection, or save your money and labor.

APPLE BILL says: "...Two 'O. B.' Products that fill the bill. One kills the worms young... and the other keeps the scab off."

ORCHARD BRAND ARSENATE OF LEAD

is establishing new records throughout the country for giving a greater degree of codling moth control... and higher Grade "A" packs.

It covers with thin, flake-like particles which tend to overlap... giving a smooth, continuous film which reduces bare spots to a new minimum.

BY E. R. EASTMAN

Address all mail for Editorial or Advertising departments to American Agriculturist, Savings Bank Building, Ithaca, New York.

A Letter to Dairymen

I HAVE SENT the letter printed below to 50,000 subscribers. After you have read it, turn to page 11, where you will find the questions which I inclosed with the letter. If you did not receive a letter or if you overlooked answering the questions and returning them, won't you do so now? Send them to E. R. Eastman, *American Agriculturist*, Box 367-D, Ithaca, N. Y.

Dear Friend:

American Agriculturist wants to continue to do everything it can to help dairy farmers get a living price for milk. We don't want to promote any milk marketing plan of our own, but instead we want to help put into operation a marketing plan that a majority of you dairymen want and will support. Therefore, I am coming to you and other dairymen with a personal request for advice, and to find out what you really want.

More dairymen and more of their marketing organization worked shoulder to shoulder under the Rogers-Allen Act and the State and Federal milk marketing agreements than had ever agreed on any plan. For that reason *American Agriculturist* supported the agreements. As a result of this splendid cooperation and good support of the milk marketing agreements, milk prices immediately rose, and continued better while the agreements were in effect. To be sure, this marketing plan was not perfect, but amendments and corrections could have been made as experience showed where they were needed.

As soon as the agreements were declared out by the courts, milk prices to farmers went on a toboggan slide. And they will continue ruinously low until some stabilization plan can be put to work.

Greasing the price slide downward is a huge surplus; milk production is higher than in years, and surplus products prices, such as butter, cheese, evaporated milk, are the lowest in a long time.

To add further to dairymen's troubles, the chiseling milk dealers and other members of the anti-farm gang are taking this period of confusion and uncertainty to create more misunderstanding and hatred among farmers in order to keep them apart. These enemies of farmers are carrying on a whispering campaign of lies and misrepresentation, telling you that your neighbor and your neighbor's organization are your enemies, that the other fellow's organization is responsible for the crash in prices, that the leaders of your neighbor's organization have sold you out, and so on and on and on. In Buffalo, dealer members of this gang placed a card on every milk bottle, stating that the Nunan-Allen Bill is unfair to all consumers of milk and dairy products, and urging the consumer to fill out a post card addressed to the Legislature asking the defeat of this bill.

The question before us is, what to do? We had a plan and it worked. Do you want it restored? If so, here are the steps.

I. SECURE PASSAGE OF THE NUNAN-ALLEN BILL

This corrects defects in the Rogers-Allen Law. It is now before the Legislature. Without it, neither State nor Federal marketing agreements can be put in force.

II. SUPPORT REINSTATEMENT OF MARKETING AGREEMENTS

Favorable decision is hoped for from the United States Supreme Court, reversing Judge Cooper's opinion. The Supreme Court has promised to argue this case April 24. If and when a favorable decision is obtained, be ready to join with your neighbors and with other cooperatives in reinstating the marketing order if you want it.

III. KEEP FAITH IN YOUR NEIGHBOR AND IN YOUR DAIRY LEADERS

In this time of temporary confusion, let us resist chiseling dealers and others who for selfish or personal reasons have always tried to keep farmers mad at one another. I have great confidence in the American farmer's sane thinking when he has the facts. Let us be sure of the motives back of all per-

sons who are criticizing your neighbor or neighbor's organization or your cooperative.

If you follow the above outlined steps or principles, I am sure you will be able to put in force by July 1, or by September 1 at the latest, a practical milk marketing plan that will help restore living prices for milk.

Maybe you don't want the marketing agreements and orders restored. All right, maybe some other plan will work if a large majority of you will support it. In order that *American Agriculturist* can find out what you do want, take a couple of minutes and answer the enclosed questions, returning them to me *within two days from the receipt of this letter* in the envelope provided, which requires no postage. *Your name will be kept confidential*, but the opinion of the majority which we thus secure will be used as our guide in working with the Legislature and through the columns of our great paper to get you what you want.

Sincerely yours,

(Signed) E. R. EASTMAN,

—President and Editor, *American Agriculturist*.

Don't Remove Gas Tax Exemption

ONE SCHEME to raise more taxes now being considered by the New York State Legislature is to remove farmers' exemption from state gasoline taxes. If this is done, it will cost the farmers of New York State a million and a half additional money in taxes for operation of motor machinery and vehicles used in carrying on the farm business.

Here is another example where the constantly and rapidly increasing costs of government continue to work injustice to both agriculture and business. All business and the professions are absolutely dependent upon the prosperity of agriculture. The Legislature well knows this. Why, then, keep piling it on? Farmers have stood about all they can. We hear a lot about government trying to help agriculture. A practical way to help is relief from the crushing burden of taxation. Let your legislative representatives, both senators and assemblymen, know how you feel about this gas tax. Telegraph or write immediately, asking that the gasoline tax exemption be continued.

New York Legislature Cuts State Expenses

THIS year Governor Herbert H. Lehman of New York proposed a budget for the consideration of the Legislature of approximately 419½ million dollars, the largest in the history of the state. This budget is necessary, thinks Governor Lehman, chiefly because of increased expenditures for relief, and to carry on necessary state work. Both the Governor and the Legislature are trying to cut expenses as far as possible without interfering with necessary services.

Urged on by a protest from great numbers of taxpayers, the Legislature has been working for weeks to reduce expenses, and has now suggested a reduction of 30½ million dollars. To make this material reduction, the Legislature proposes:

1. To prevent increases in salaries of state employees, particularly those receiving more than \$3500 a year.
2. To drop some jobs which the Legislative leaders think are not essential.
3. To ask department heads and administrators of state public work to cut all absolutely unnecessary work to a minimum, thereby reducing expenses.

To meet even the lowered budget, the Legislature thought it necessary to increase taxes, and

proposes more taxes on liquor and cigarettes.

Now, it is just as hard for a government to economize as it is for an individual. It is always difficult to cut down expenses. It cannot be done without working hardships and sometimes injustices; and in the case of government some very important work, for the time being at least, will have to stop. Nevertheless, the taxpayers of the state will heartily approve the reduction in state expenses. Such reduction just had to come, for with income from both agriculture and business reaching new lows, neither the business man nor the farmer can stand it to pay the continually climbing taxes.

License Fee for Tractors?

A FEW DAYS ago a farmer in Seneca County, New York, was using a tractor, equipped with rubber tires, to haul wood on the public highway from his own woodlot to his farm. The wood was for his own use. En route the farmer was arrested by a state trooper, hauled before a Justice of the Peace and fined \$5 for driving a motor vehicle on the highway without a license. The fine was suspended, but that does not alter the principle involved.

The farmer was naturally indignant, so were all of his neighbors—and worried too. A commercial license costs on the average around \$25, with an additional license for a trailer of \$8 or \$10 more. Thousands of farmers have to use the highways to get their tractors and equipment from one section of their farm to another, or back and forth between two or more farms under the same management. If they are forced to pay from \$25 to \$40 more in license fees, many of them will have to keep their tractors in the barn.

To meet this situation, New York State Farm Bureau Federation has worked to secure the passage of the Lupton Bill in the Legislature, which provides a nominal license fee of \$1 for both tractors and trucks used on the highways only between areas or farms under the same management. The Legislature has passed this bill, and it is now in the hands of the Governor. It is to be hoped that Governor Lehman will sign this bill promptly and correct this injustice. New England and New Jersey farmers better watch this also.

Eastman's Chestnut

I AM indebted for the following story to H. D. Dudley, Whiteville, New York:

"Jimmy Barrett spent his life in this community as a hired farm hand. Because he was an exceptionally good worker, he was never without a job. Because he was afflicted with a decided speech impediment he was considered by many as being simple minded.

"You will recall that some years ago the summer months brought travelling photographers through the country districts. One day one of these fellows visited the farm where Jimmy was working. The owner was away, but his wife wanted a picture of the farm buildings and a new team of horses of which they were very proud. She instructed Jimmy to lead the team on the front lawn and hold them while the picture was being taken. Jimmy was elated. When his boss returned, he could hardly wait to tell him the news. Says Jimmy, 'You missed it. We had our picter took and I held the team in the front yard and I am right there in the picter.'

"Well, now, Jimmy," said his boss, "I am awfully sorry about that."

"Why?" asked Jimmy.

"Well," said his boss, "when people see that picture they're going to think we got a fool in the family."

"Yes," said Jimmy, "and they'll wonder why he wasn't here to get his picter took."

FARMERS URGE PASSAGE of Nunan-Allen Bill

MORE THAN 2500 farmers from every part of the milk shed traveled to Albany on April 12 to attend the hearing on the Nunan-Allen Bill, aimed at correcting the defects in the Rogers-Allen Law, and restoring a living price for milk. Reports indicate that more than 90 per cent of farmers attending were in favor of the Nunan-Allen Bill.

Speakers opposed to the Nunan-Allen Bill claimed that it had not brought better prices to dairymen. On this argument they were promptly and efficiently answered by those in favor of the bill, who proved with figures that millions of dollars of additional money had come to dairymen while the milk agreements were in effect. If further proof is needed, dairymen should compare prices which they get for the next few weeks with what they did get while the agreements were in effect.

Speakers at the hearing for the Nunan-Allen Bill pointed out that almost 90 per cent of the dairymen voted for the marketing agreements based on the Rogers-Allen Bill and the Federal Law in the first place, that even more dairymen were now in favor of the passage of the Nunan-Allen Bill and the restoration of the agreements. Commissioner Noyes warned farmers of the possibility that they might receive, before late summer, prices as low as \$1 or less a hundred pounds. My guess is that these prices will be here before late summer. Commissioner Noyes also stated his opposition to a bill by Senator Gilbert T. Seelye and Assemblyman Richard J. Sherman, because if passed, it would bring delays in establishing milk marketing areas and would necessitate a new hearing and new vote on a new order.

Said the Commissioner: "The Nunan-Allen Bill, it seems to me, is based upon a recognition of the fundamental principle that each producer in the state must share benefit and disadvantage equally with his neighbors if there is to be a satisfactory settlement of the industry's problems."

Fred H. Sexauer, President of the Dairymen's League, said that too much tinkering at this time will destroy the first real working plan dairymen have had for years. He stated that the Nunan-Allen Bill meets the objections found by Justice Bergan in the Rogers-Allen Law, and that the simplest and quickest way to restore a marketing plan which worked is to pass the Nunan-Allen Bill as is.

Van Whittemore, Director of the New York State School of Agriculture at Canton, N. Y., said that the Federation of Chambers of Commerce of northern New York is 100 per cent behind the Nunan-Allen Bill and had passed a resolution to that effect (see report of northern New York meeting on this page).

Senator George F. Rogers told the legislators at the hearing that "unless you pass the amendments exactly as they are you are going to have the worst conditions in New York State you have seen for a generation."

Following is a list of those who spoke both for and against the Nunan-Allen Bill:

THOSE FAVORING

Mr. E. C. Bardin, Bargaining Agency
Mr. Sherrill Hufcut, Circleville Coop. Assn. Inc.
Mr. Homer S. Rolfe, President, Bargaining Agency
Mr. Earl Laidlaw, Gouverneur Cooperative
Mr. Earl B. Clark, Farm Bureau Federation
Mr. Fred Sexauer, Dairymen's League
Mr. H. P. Smith, President, Sheffield Producers
Mr. Francis McElroy, Former Senator, Syracuse, N. Y.
Mr. Van C. Whittemore, Canton Agricultural School
Mr. Harold Stanley, State Grange
Dr. Kenneth Shaul, Chairman, Sales Committee
Mr. Roland Sharp, Guernsey Breeder, Rhinebeck, N. Y.
Mrs. Florence Hayden, Corfu, N. Y.
Mr. George F. Rogers, Former Senator, Rochester, N. Y.
Mr. Dan Anderson, Norwich, N. Y.
Commissioner H. V. Noyes, Albany, N. Y.
Mr. Howard Allen, Assemblyman, Pawling, N. Y.

By E. R. EASTMAN

Mrs. Emma Crist, Orange County Farm Wife
Mr. Lester E. Tucker, Milk Producer, Marathon, N. Y.
Mrs. Vertrees Ackerly, Crystal Run, Orange County, Farm Wife
Mrs. Carey, Ft. Edward, N. Y.
Mr. Edward Dwyer, Batavia Chamber of Commerce
Judge Roscoe C. Harper, Waddington, N. Y.
Nellis Bronner, Little Falls, N. Y.

I was unable to attend the hearing, but sent the following telegram to members of the Senate Committee on Agriculture.

"DAIRYMEN, DESPERATE BECAUSE OF SUSPENSION OF FEDERAL-STATE MARKETING AGREEMENTS, RESULTING IN RAPIDLY DECLINING PRICES, ARE HOPING ANXIOUSLY THAT YOU WILL NOT PERMIT A VOCIFEROUS MINORITY TO PREVENT IMMEDIATE PASSAGE OF THE NUNAN-ALLEN BILL."

How many of you dairymen who were unable to attend made your wishes known by letter or telegram?

The members of the Senate Agricultural Committee are: J. D. Nunan, Jr., Philip M. Kleinfeld, James J. Crawford, A. A. Ryan Jr., A. H. Wicks, G. T. Seelye, Rhoda F. Graves, (chairman), Fred A. Young, W. H. Hampton, William C. Martin, Roy M. Page, C. T. Stagg, H. W. Griffith, K. K. Bechtold, and S. J. Wojtkowiak.

THOSE OPPOSED

Mr. Archie Wright, Farmers Union, Ogdensburg, N. Y.
Mr. E. J. Davies, Wyoming County
Mr. Henry F. Manley, Attorney, Delmar, N. Y.
Mrs. Helen Mintz, S. Buffalo United Consumers Society

Mr. C. L. Newman, Unity Cooperative, Arcade, N. Y.
Mr. George Marland, N. Y. C., American Labor Party
Mrs. John Frazier, N. Y. C. Milk Consumers Committee
Mr. John J. Dillon, Rural New Yorker, New York City
Dr. J. R. McElroy, Jonesville, N. Y.
Mr. Charles Knowell, Tonawanda, N. Y.
Mr. Patrick J. Lally, Dutchess County
Vera E. DeGroat, Central New York Farm Woman
Mr. B. J. H. Rikert, Secretary N. Y. S. Guernsey Breeders' Association
Mr. Robert I. Millonzi, Attorney, Buffalo, N. Y.
Mr. Berghold, Rural New Yorker, New York City
Mr. Myer, Boston, Erie County, N. Y.
Mr. P. D. Richards, Perry, N. Y.
Mr. Jerry Loomis, Pulaski, N. Y.
Mr. Meyer Parodneck, New York City

At the close of the hearing some of the legislators remarked that it was very apparent that dairymen wanted the Nunan-Allen Bill, and it was their guess it would be passed soon.

However, dairymen should take nothing for granted. You had a milk marketing agreement that worked. Now you have nothing. To restore these agreements the passage of the Nunan-Allen Bill is absolutely essential. It is fully expected that the Supreme Court will give a favorable decision during the late spring making it possible to restore the Federal marketing agreement. But that agreement cannot be put into practical effect in New York State again without joint co-operation of the State and of dairymen, made possible through the provisions of the Nunan-Allen Bill.

Therefore, if this bill has not passed by the time you read this, I urge you as emphatically as I can to write or wire your senator and your assemblyman.

"North Country" Business Men Stand Back of DAIRYMEN

LAST ISSUE we reported the action of the business men of western New York who, under the leadership of the Batavia Chamber of Commerce, gave their united support to the dairymen in their present plan to restore a living price for milk.

The Batavia Chamber of Commerce also has written to other Chambers of Commerce around the state, suggesting that business men elsewhere do the same thing.

As a result of this action and the keen desire of business men everywhere to help farmers, various Chambers of Commerce have been holding meetings to learn the facts and to do all possible to help agriculture in general and dairymen at this time in particular. One of these Chambers of Commerce meetings was held at Canton, New York, on April 10, under the auspices of the Northern Federation of Chambers of Commerce, representing 20 northern New York Chambers of Commerce and business men of that same section in general.

At this very representative meeting Earl Laidlaw, prominent northern New York dairyman, Frank Crary, another well known North Country farmer, and head of the local bargaining agency cooperative at the Canton Sheffield plant, and myself, spent the afternoon in reviewing the facts which led up to the present situation, and at the close of the meeting the executive committee of the Federation by unanimous vote of all ten of the members who were present, went on record in support of the Nunan-Allen bill, which provides the necessary amendments to the Rogers-Allen Law.

The committee also instructed Van C. Whittemore, director of the State School of Agriculture at Canton, and head of the agricultural committee of the Northern Federation of Chambers of

Commerce, to go to Albany for the hearing on the Nunan-Allen Bill on Wednesday, April 12, and ask the Legislature to support the Nunan-Allen Bill, in the name of the Northern Federation of Chambers of Commerce and of North Country business men in general. Mr. Whittemore did as instructed, and made a very effective speech at the hearing.

The Federation furthermore adopted a unanimous resolution commending Holton V. Noyes, state commissioner of agriculture and markets, for his splendid help and support of dairymen in their efforts to restore the milk marketing agreements. The resolution read in part:

"Commissioner Noyes has shown himself to be a true friend of farmers, ready and willing to act with all who would act constructively."

In my talk to the business men and the Federation, I pointed out that if the marketing agreements could have been continued the April price to farmers would have been at least \$1.50 per hundredweight. Without the agreements, no one knows at this writing what the price will be, but probably it will not be over \$1 per hundred and it certainly will be \$1 or less by June. This means a loss to the North Country dairymen of \$880,000 for June milk alone. The loss of such a tremendous sum in the short time of one month affects the economic welfare of every single resident of the North Country no matter what his business or profession.

I said further that every statewide organization of farmers in New York favored the marketing agreements and their restoration. Also in support of these agreements were the State and Federal governments, *American Agriculturist*, at least 75 of the dairymen's own cooperatives, and a very great majority of the dairymen themselves. Business men make (Turn to Page 13)

THE LEAGUE HAS FOUGHT FOR THESE THINGS FOR 20 YEARS

We believe every farmer in the milkshed agrees with us on these points.

For 20 years the Dairymen's League has fought this battle.

For 20 years we have met exactly the same opposition.

For 20 years we have argued that the only way these things could possibly be achieved would be for farmers to organize and control their own destiny.

For 20 years farmers have been refused the privilege to organize and bargain collectively.

For the first time in 20 years the farmers were given this privilege under the State and Federal orders. For the first time they were allowed to organize and set the price for their milk.

Every farmer knows what happened. In a few months' time under these privileges we farmers were able to show higher prices for our milk even in the face of extraordinary surpluses and low-world butter and cheese prices. The Supreme Court has been asked to review the Federal order. The State legislature has been asked to overcome the objections of the Rogers-Allen law.

We should have these privileges again within 90 days. Let's be prepared when the time comes. Every dairy farmer in the state should stand fast in this battle for
A LIVING PRICE FOR MILK

**FAIR WEIGHTS AND HONEST TESTS and
COMMON INTEREST OF FARMERS AND
RURAL COMMUNITIES**

A living price for milk with fair weights and tests means adequate farm income.

GRAIN SMUTS

Are With Us Always!

By WILLARD CROSIER,
Experiment Station, Geneva, N. Y.

GAMBLING with the smuts of oats and barley is a losing game. The odds are at least 2 to 1 against you. Sometimes the loss is not large with 1 or 2 per cent, or perhaps only a trace of smut affecting the crop. Often, however, 5, 10 or even 15 per cent of the oat grains are diseased and the grain bin lacks just that much of being as full as it should be.

Just to check on the actual condition of oats throughout western New York, several hundred fields in eight counties were examined a few days before harvest. Only 42 per cent of the fields were entirely smut-free, and probably most of these were grown from treated seed. Another 19 per cent contained less than 1 diseased plant in each 1000 counted. Then another group comprising 20 per cent of the total were more severely injured, 20 to 30 smutted heads being found in each 1000. The other 19 per cent of the fields belonged to the severely smutted group. Every fifth panicle of oats was ruined in one field and one diseased plant to every nine healthy ones were common.

Laboratory tests have demonstrated that spores are present on many lots of seed irrespective of their appearance. Treatment for disease is a profitable supplement to cleaning, and often the two operations may be combined. Several of the large seed companies now treat all of their oats with formaldehyde and after the spores have been killed the seed is run through a fanning mill both to clean it and to remove the formaldehyde vapors. Field trials for several years have proven that oats treated in this manner are smut-free. Laboratory tests have shown that the seed germinates normally, even three months after treating.

The percentage of smut-infected seedstocks sold by dealers has decreased markedly since the advent of the aeration-formaldehyde process. As a means of comparison the records from our inspection fields show that 94 per cent of the oats sold by dealers in 1934 were smutted, averaging about 3 diseased plants per 100. Certified lots were almost entirely clean. In 1935 the percentage of smutted seedstocks dropped to 90 per cent and in 1936 less than 1/3 of all the oats sold by dealers developed any smut in the Station trials. All of the seedstocks represented to have been "Treated-for-smut" produced entirely clean crops. For a few cents extra cost the treated oats will return a handsome dividend.

On the farm uncleaned oats may be sprayed with formaldehyde at the rate of 1 pint mixed with 1 pint of water to 50 bushels of grain. The seed should be tightly covered for a period of 4 to 6 hours and then cleaned and aerated by a fanning mill. The aerated seed may be safely stored until planted. The excess may be fed to livestock or, if the oats are valuable, stored for planting the next spring. The commonly recommended method is to treat the cleaned seed only 4 to 6 hours before planting. If drilling is delayed for several days, however, the oats should be aerated to prevent reduction in germination.

Another successful modified method depends on a reduced dosage of formaldehyde. When a farmer wants to treat his oats before the spring rush or at least 2 weeks before planting he should use only 1/3 pint of formaldehyde to each 50 bushels of grain. The

seed is well mixed with the chemical and left tightly covered for a day or at least overnight. The oats can then be sacked up ready for planting.

Barley and oats and barley mixtures should be treated with a dust, New Ceresan, rather than with formaldehyde. Certain organisms which attack the young seedlings are controlled only by New Ceresan. Alpha barley can profitably be treated even when smut is not present. The seed to be treated must first be well cleaned, then usually a bushel of barley is sprinkled with a 1/2 ounce of dust. Additional seed is added and more chemical applied. The process is repeated until a large cone-shaped pile is formed. Then the grain must be shovelled over sev-

eral times until all visible traces of the dust have disappeared. The treated seed may be placed in coarse sacks and must be held at least 24 hours before planting.

The dosage of 1/2 ounce per bushel should never be increased. Additional chemical is not necessary for disease control, and may result in reduced germination of the grain. One sample collected was so severely injured that only 11 per cent of normal sprouts developed. The seed had been treated at a 2-ounce rate. Every one of 26 other New Ceresan-treated samples germinated normally after 5 to 9 weeks storage. There is less danger of seed injury and the smuts are controlled just as well if seed which is to be stored for a week or longer is treated with only 1/4 ounce of New Ceresan per bushel. Repeated trials have shown that oats and barley treated at this rate are not injured even when stored in tight containers for one year. The gravity treater does a much better job with the New Ceresan than can be done with a shovel and there is less danger of inhaling the poisonous vapors. County agricultural agents

"THANK YOU for Building a Great Tractor - the FARMALL"

• THIS THOUGHT, expressing the appreciation of a Farmall owner in Michigan, has come to us in many letters from enthusiastic owners who have proved the value of their Farmalls. During the years since the original Farmall was announced, thousands have taken the trouble to write us. Each added feature or improvement has brought new praise.

Right now, farmers all over the land are at work with their Farmalls, enjoying the power and performance that extends the reputation of these handsome red tractors year after year. These owners will tell you it pays to pick the genuine Farmall, the only tractor that brings you all of these valuable features:

- 1—Patented automatic steering-wheel cultivator gang shift. Clean cross cultivation at four miles an hour.
- 2—Most complete line of direct-attachable machines to choose from.
- 3—Unmatched ability for all row-crop work.
- 4—Outstanding economy on distillate or other tractor fuel.
- 5—Smooth 4-cylinder power—valve-in-head efficiency.
- 6—Replaceable cylinders.
- 7—Steering operates wheel brakes automatically when making pivot turns.
- 8—Unequaled record for long life.
- 9—High resale value.
- 10—Complete nation-wide service.

Ask the International Harvester dealer in your community to demonstrate a McCormick-Deering Farmall. There are three Farmalls to choose from: F-14, F-20, and F-30.

Poultry breeder and hatcheryman.

BY L. B. SKEFFINGTON

From SKEFF'S NOTEBOOK

THE other day I sat in a round-table discussion with some leading fruit growers and a few specialists from Cornell and Geneva. The topic veered around to advertising and promotion, and to the reluctance of many growers to pay for such things. A point was raised that if each section of the country or each commodity increased its promotional work one would offset the other and the whole result would be more or less nullified.

I am glad to say that this attitude did not prevail in the gathering, but it does represent a point of view I hear occasionally. So it was with much interest that I received a report from California that this season the California Fruit Growers Exchange, the Sunkist organization, will spend \$600,000 on advertising Valencia oranges. This amount will be raised by an assessment of five cents per box on 26,000 cars of the fruit. And just to complete the item, the announcement added that most of the money will be expended for newspaper space.

Assessment Voluntary

Some states have compulsory advertising taxes on certain commodities. Examples are potatoes in Maine and Idaho and milk in New York. But so far as I know, the largest amounts raised for promotion of farm products are the voluntary assessments on citrus fruits in California and Florida.

The amount of the assessment is determined by the directors of the exchange and is collected as the fruit is marketed through the marketing organization. There has been little agitation for substitution of a state tax for the simple reason that the growers' own organization is doing a good job. And little kick is heard on the amount of the assessment.

Then after reading the reports from California I turned to the news from Florida. Here is an item: "Florida growers disposed of nearly five million boxes more oranges this season than a year ago, and national citrus sales are given credit for making much of the large additional movement possible. Cooperation upon the part of the trade has been excellent, it was said."

Prices Low, But —

It is true prices for citrus fruit have been low this season because of the large supply, but the fact remains that instead of allowing the crop to rot under the trees an effort was made to move more of it into consumption. Of course, it may be argued that the more fruit produced and marketed the lower the price. But in this case we are dealing with crops already produced and not with crop reduction.

The five million boxes of Florida oranges represent sales and some returns that growers would not otherwise have received. The movement goes a long way to prove that consumption can be widened. It is fair to assume that new tastes have been cultivated for oranges. I do not know just how Florida growers have handled their advertising funds this season, but I do know they have in some seasons assessed themselves as high as seven cents a box.

All of this raises questions of, for instance, whether Northeastern apple growers should try to promote their own product or just lay down on the assumption that the citrus growers are doing a fine job and there is no use competing with them.

Eastern Apples Gaining

At the meeting I refer to, Dr. M. P. Rasmussen, professor of marketing at Cornell, quoted from his studies to show that eastern apple sales have been gaining in the New York market as the movement of western apples declined. Now it happens that for several

Assembly Amends Nunan-Allen Bill

AS WE go to press, a final vote on the Nunan-Allen Bill is expected in the Assembly on Monday, April 24. Last week Wednesday an amendment to the Nunan-Allen Bill was passed by the Assembly, 71 to 68, exempting "small dealers" from participating in the equalization pool. Most dairy farmers do not want that amendment. If the Nunan-Allen Bill becomes a law with this amendment included, it will seriously hamper the administration of milk marketing agreements when and if they are again made effective.

In the Senate the Nunan-Allen Bill is still in the Agricultural Committee, and it is uncertain just when it will come to a vote.

years the New York and New England Apple Institute, a co-operative organization of growers, has been doing considerable missionary work with the trade. Dr. Rasmussen was asked how much the work of the institute had been responsible for the shift in the trend from western to eastern apples. "I don't know", he replied. "Probably there are many things involved, but the work of the institute has been effective. Make no mistake about that—the constant plugging of the institute for eastern apples has helped."

Competition or Cooperation?

Recently the New York and New England Apple Institute, the New Jersey Apple Institute and Appalachian Apples (the Virginia, West Virginia, Maryland and Pennsylvania growers' promotional group) jointly conducted a

These students at the State College of Agriculture are winners in the Fitting and Showmanship Contest held during Farm & Home Week. Gardner, Penn Yan, N. Y., Champion Hampshire Showman; Robert Stevely, Palmyra, N. Y., Champion Dorset Showman; and H. E. Outhouse, Canandaigua, N. Y., holding the Champion Delaine which was fitted and shown by Clark Chase, III.

campaign in New York City and environs. The co-operation based on the principle that all apple growers' interests should join in popularizing apples.

After this campaign was over Major C. E. Chase of the Washington State Apple Commission met Tom O'Neill of the New York and New England institute and told him he would have been glad to join in the good work. In this case he did not know about it and his cooperation was not asked. Undoubtedly Chase's viewpoint is that anything which induces people to try eating apples is good for all apple growers. The basic principle of Sunkist's advertising policy is to popularize oranges and lemons first, and then get as much as possible of the business for the brand.

I suppose there is a saturation point in selling farm products. The point our eastern growers have to ponder is whether they are going after as much of the market as they can obtain, or whether they are going to let fear of a possible saturation point curb their own promotion.

The next point this raises is whether promotional work is going to be done by funds voluntarily contributed by growers, or by a tax levied by the state upon the commodity. Growers are divided into two camps, both with some very effective arguments. The subject already is popping up in Northeastern legislatures. Perhaps later it may be worth while to give some angles on voluntary and compulsory assessments in this column.

Canners' Bonds

One of the troublesome matters before the State Department of Agriculture and Markets is bonds for canners.

There is a law on the statute books which says the commissioner shall exact a bond from each canner to assure payment to farmers for their produce. The law was enacted in 1935 after a few canners got into difficulties. During the past season three or four canners have failed and amount of bonds has been far too small to pay growers.

Bonding companies have not been willing to give large bonds and in many instances canners have had to provide cash or readily negotiable paper. Some growers have asked the department to insist upon larger bonds and canners have replied that they might be forced out of business. In an effort to arrive at a sound policy, Commissioner Noyes called a meeting in Rochester, at which more than 100 growers and canners attended.

The Commissioner said frankly he was in a position of "damned if I do and damned if I don't." In many communities even the small canners provide a necessary outlet for farmers' crops and anything which hurts the canners may hurt the growers. On the other hand, it is desirable to insure payment to growers. George Morse as spokesman for growers suggested consideration be given to a law giving growers right of prior lien. It is argued that at present, prior liens sometimes are obtained on canned stock warehouse receipts by makers of cans, machinery and other interests, so that by the time they get theirs the grower may be left out.

The Commissioner indicated that where there might be doubt about acceptance of bonds the department might call hearings in the communities affected. Some of the growers said they wanted to be at least on the same status as labor with mechanics' liens on warehoused stock.

Dairymen to Cooperate

There are 340 independent milk producers in the several counties shipping milk to the Rochester market. The other 1,500 producers shipping to that market are members of eight cooperatives. Recently all producers in the area took a cut in milk prices and there has been fear expressed that other cuts may be due. Representatives of the eight co-ops got together and made some progress on the idea of forming a bargaining agency. The question was what would the 340 independents do, because they controlled enough milk to make or break the market.

A committee of the independents, Levi Higley of Elba, Parce Hannan of Fairport and Harry Sabin of Scottsville, called a meeting of the independents. About 250 of them turned out and, in brief, indicated their desire to organize a cooperative so that they could join with the other co-ops in forming a bargaining agency. With the three named, Hampton Halsey of Spencerport and Charles Baetzel of Honeoye Falls are a committee to draft plans.

There was plenty of frank discussion at that meeting and some dislike was expressed for policies of some co-ops, but there was a generally apparent desire that all dairy groups stand together under an amended Rogers-Allen law. It was one of the most encouraging milk meetings I ever attended. It again demonstrated that dairy farmers can and will cooperate.

Rochester Chosen to Try Out New Surplus Distribution Plan

SECRETARY of Agriculture Henry S. A. Wallace announced on April 18 that Rochester, New York, will be the first of a half dozen widely separated cities in which the new food stamp plan for distributing surpluses through normal channels of trade will be started. The plan contemplates wide consumption of surplus farm products by increasing the purchasing power of low-income families and is expected to get under way in Rochester within the next 30 days.

Distribution of surpluses will take place through wholesale and retail grocery outlets in Rochester during the experimental period of two to four months. Grocers in that city have indicated their willingness to push sales of surplus products to all consumers under the plan. Increased purchases, together with those by people eligible to use stamps, are expected to stimulate business generally.

With a population of 330,000, Rochester has several thousand families receiving some form of public assistance. About 5,500 heads of families there are employed on WPA projects.

The Federal Surplus Commodities Corporation will continue its regular program of buying surpluses direct and donating them to State welfare agencies for distribution for relief purposes in all areas except where the new food stamp plan is in effect.

Two variations of the food stamp

plan, both of which are voluntary, will be tried out in Rochester. Under one, WPA workers may request that an amount equal to \$1 a week for each member of the family be deducted from their wages. Such workers will receive orange colored stamps good for purchasing any food in an amount equal to that which they have asked to be deducted. While the \$1 a week for each member of the family would be the minimum amount which could be obtained, such workers will be eligible to obtain orange stamps of a value up to approximately \$1.50 a week for each member of the family, if they wish. In addition, blue stamps representing 50 per cent of the value of the orange stamps issued to each person and good only for foods designated as surplus, will be given free.

The other variation of the plan makes the same minimum of \$1 in orange stamps and a maximum of about \$1.50 in orange stamps available for purchase by the person receiving general relief, old age assistance, aid to dependent children, and aid to the blind. With every one-dollar purchase of orange stamps, these eligible persons will receive free 50 cents in blue stamps good for exchange for certain designated surplus foods at any grocery store.

Arrangements are being worked out for redeeming the stamps locally by

Oleomargarine

By LELAND SPENCER

THE question has been raised as to whether the use of oleomargarine is not responsible for the surplus of butter. One reader suggests that proper restrictions on oleo would solve the whole problem of butter surplus and low prices for milk. Right or wrong, this dairyman is not alone in his opinion that something ought to be done about butter substitutes. The question has been a live issue in Congress this year, and for many years past.

Leland Spencer

Since 1910 the amount of oleo consumed per person in the United States has varied from 1.4 lbs. to 3.4 lbs. per year. Also in 1932, the quantity of butter used per person

was 18.3 lbs. but last year the amount fell to 17 lbs. Americans use about one-sixth as much oleo as butter. While consumption of both oleo and butter has varied from year to year, neither has shown a definite upward or downward trend since 1916. In many countries, including Great Britain, Denmark, Germany and The Netherlands, the people use much more oleo than we do. On the other hand, in Canada, Australia and New Zealand the production and sale of oleo are prohibited entirely.

Oleo is much cheaper than butter, but the difference in price varies. In 1932 retail prices of butter averaged only 12 cents a pound higher than oleo but in 1937 the difference was 22 cents. Ordinarily oleo retails for five to ten cents a pound more than

lard, but in the past 5 years the average difference in price was less than 2 cents a pound. Probably the increased use of oleo the past few years has been largely as a cooking fat rather than as a butter substitute.

The production and sale of oleo has been regulated in various ways for many years. Federal regulation began in 1886 and the present legislation is changed but little from the law enacted by Congress in 1902. Manufacturers, wholesalers and retailers of oleo are licensed and have to pay certain fees, namely \$600 a year for manufacturers, \$200 for wholesalers and \$6 for retail stores. Wholesalers that deal in colored oleo are taxed \$480 instead of \$200, and retailers \$48 instead of \$6. In addition there is an excise tax of 1/4 cent a pound on uncolored oleo and 10 cents a pound if the product is colored to resemble butter. Because of the higher taxes on colored oleo, most of it is made without color and is readily distinguishable from butter.

Besides the license fees and taxes I have mentioned, there is a tariff of three cents a pound on various imported oils and fats and a special excise tax of 3 cents a pound on oleo made from foreign fats. Altogether, these direct federal taxes probably have raised the price of uncolored oleo about 3 to 4 cents a pound. Many of the states also have special taxes on oleo, some as high as 15 cents a pound, but there is none in New York. Most states prohibit the sale of colored oleo and require the display of placards in all places where oleo is sold or served. Still another type of restriction is the provision in appropriation bills for Veterans Hospitals, state Institutions and the like, that none of the money is to be spent for butter substitutes. Oleo is now made mostly from vege-

table oils. All animal fats make up less than 10 per cent of the total ingredients. During the 1920's coconut oil became the chief basis of oleo manufacture, but its use has been greatly cut down since the 3 cent excise tax was imposed in 1933. Now cottonseed oil constitutes about two thirds of all oleo ingredients.

The oleo battle has therefore become not only a fight between the dairy interests and the oleo manufacturers, but also a struggle between dairymen and cotton growers. Recently dairymen's organizations have been pushing a proposal for a processing tax of 5 cents a pound on all oleo, and an additional tax of 5 cents when the product is made from foreign fats or oils. Obviously these additional taxes would benefit dairymen and hog producers. Oleo manufacturers would require less cottonseed oil but other uses might take more due to the higher cost of foreign oils. Consumers, finding a smaller difference between oleo and butter prices would use more butter.

In a recent publication of the United States Department of Agriculture, it was estimated that if oleo were entirely eliminated from the picture, consumer expenditures for butter would increase somewhat less than 9 per cent. An increase of say 4 to 7 per cent in the price of butter certainly would help the dairyman. However, in comparison with the present deficiency of income on dairy farms this is only a drop in the bucket. We can't get away from the fact that the basic trouble is the low price level, rather than substitutes, imported goods and the many other reasons that are commonly mentioned in these times of economic confusion.

March Milk Prices

For March the Dairymen's League announces a net pool price of \$1.30 for 3.5 milk in the 201-210 mile zone, including an average differential of 6c. Price is 46c less than the February price. Production in herds of League members is reported as 16 lbs. per day per dairy heavier than a year ago.

Sheffield producers have announced a price of \$1.46 for 3.5 milk in the 201-210 mile zone.

Cow Figures

The number of dairy cows and heifers over two years old in New York has been relatively stable at about 1,400,000 for thirty years. The number of heifers under two years has varied from about 170,000 to 300,000. The number of dairy cows in New York has increased for the past four years, and on January 1 was the largest in thirty years, with the exception of January 1933 and for the period of 1916 to 1923 when wartime demands for milk caused

ed an expansion in dairying.

The number of heifers raised in New York in 1939 indicates that cow numbers will continue to increase unless there is a higher rate of elimination from herds. Apparently a period of low slaughter of beef cattle is ahead which will tend to support the price of dairy cows and encourage culling of low producers.

The purchasing power of dairy cows in the United States has been rising for four years, and probably will continue to rise until some time in the early 40's. If the general price level rises, cows will probably bring more dollars, but compared with things purchased, the buying power of cows is likely to begin to decline within a few years.

Milk Production Heavy

Total United States milk production on April 1 was reported as 4 per cent higher than a year ago, and the highest production for that date on record. On a per capita basis, production is the highest in 15 years.

During February production of manufactured products was 11 per cent above the 1924-29 average, but consumption was also higher.

Estimated storage holdings of butter on April 8 were 72,777,000 lbs., as compared with an estimate of 13,900,000 lbs. a year ago. Of butter now held, only about 3,000,000 lbs. is owned by private trade—the rest by government agencies.

Springdale Dispersal

At the farm, one mile north of Walden, 10 miles west of Newburgh, on

Saturday, MAY 6th at 1 o'clock

25 Federal accredited and Negative Pure Bred Holsteins, 4 Bulls. Rich in the blood of the former Shawangunk Valley Stock Farm dairy with an average of 14,795 milk and 517.6 fat for seven consecutive years. Combining the blood of Governor Mercedes, Ormsby Direct and other high index sires. Many females carrying calves to the service of an outstanding 4 per cent son of "Direct". Pictured and described on page 16 in the March 4th issue of the Holstein World. Make your selections at this sale, where ancestral records mean future dollars for you. FARMS FOR SALE

\$800 Secures 330 Acres

Barn alone worth price asked, on improved road 7 miles to city; 240 acres tillage, 133 fruit trees, substantial 6-room house, 65 ft. cement-hasement barn, insured \$3700; bargain price \$3800, including horses, cow, implements; \$800 down, \$2800 Federal Land Bk. Mtg. at 4 1/2%. J. J. Kiely, STROUT REALTY, 304 E. State St., Ithaca, N. Y.

Operating 50-Cow Farm

Splendid dairy country, on improved road, 10 miles to Cooperstown; 250 acres, 140-ton hay cut, valuable timber, springs and brook; good 14-room house, fine 80 ft. barn, silos, large horse barn, other bldgs.; quick-action price \$9,000, including 4 fine horses, 35 cows, bull, 6 heifers, complete machinery, growing crops; terms, \$3,000 down, \$6,000 Federal Land Bk. Mtg. at 4 1/2%. S. R. Matthews, STROUT REALTY, 58 Meyer Street, Canajoharie, N. Y.

\$300 Gets 174 Acre Farm

Easy drive to city; 75 acres fields, creek, woodland, 7-room home, large barn; silo; only \$850, \$300 down, page 38 Free catalog 16 states. STROUT REALTY, 255-R 4th Ave., New York City.

FARM—400 Acres, Grade A Milk market, 60 cows, 3 horses, farm tools, running water, house, bath, toilet, good buildings. A place for man and son. Price and terms reasonable. Will trade for other personal property. Inquire JOHN FITZGERALD, OXFORD, NEW YORK

WHAT DO DAIRYMEN WANT?

These questions were sent by *American Agriculturist* in a letter to 50,000 subscribers. If you did not receive a letter or if you have not returned the questions, we will be glad to have you answer the questions clipped from this page and send them to us. First, however, turn to page 4 where you will find a copy of the letter accompanying the questions.

- Are you a dairyman? Yes..... No.....
- If so, are you approved for New York City? Yes..... No..... For other cities in New York State?
(Name of City)
- Did the Federal-State Agreement bring you better prices for milk? Yes..... No.....
- Did you find dairymen becoming more friendly and neighborly as time passed under its operation? Yes..... No.....
- What price do you expect for May or June milk?
- Have you cancelled any planned expenditures since the Marketing Agreement went out? Yes..... No.....
If so, what?
- Are dealers (by posting notices, sending out literature, or through truckmen) spreading any stories which tend to create friction or division among farmers or groups of farmers? Yes..... No.....
Are dealers blaming farmers or groups of farmers for price cutting? Yes..... No.....
- Do you want the Federal-State Agreement reinstated? Yes..... No.....
- Do you see any real hope for reestablishing prices, handling surplus, controlling dealers, other than through the Federal-State Agreement? Yes..... No..... If you do, what plan?
- Should farmers or farm organizations work together or attack each other in the field?
- Do you belong to a dairy cooperative or organization? Yes..... No..... Give name.
- Are you willing to support a program:
 - To bring about passage of Nunan-Allen Bill? Yes..... No.....
 - To bring about reinstatement of Federal-State Agreement if Supreme Court reverses Cooper decision? Yes..... No.....
 - To keep farmers working together regardless of what the Supreme Court decision may be? Yes..... No.....

■ Farmer Has Stake in Labor Act

A TOUGH job has been Senate Education and Labor Committee's task of conducting hearings (began April 11 and still continuing at this writing), on proposed amendments to Wagner Labor Relations Act. Wide-spread are charges that Board has acted as complainant, prosecutor, jury and judge; that its decisions favor labor and are unfair to employers.

Rushing to defense of bill, Labor Relations Board made 100,000 word defense of law; made sweeping denial of charges that act is one-sided and that administration is unfair, arbitrary and partisan; opposed most of suggested amendments.

Chief among proponents for amending the act is American Federation of Labor, but farmers have been equally active in demanding change and rightly so. Wagner Labor Relations Act specifically exempted farm labor, but failed to define term. Introduced in Senate by Logan of Kentucky, and in House by Lea of California, Allen of Illinois, and West of Texas, is bill defining agricultural labor to include not only farm laborers, but "any person engaged in farming in all its branches."

Need for amendment arose when Labor Relations Board ruled that workers engaged in packing, grading and marketing farm products were not agricultural workers and were, therefore, subject to terms of law. Result was attempted unionization of farm workers, strikes, and activities, particularly in western states, frequently characterized as plain racketeering.

Farm organizations propose adoption of Logan amendment; also changes to state legal responsibility of labor organizations for unlawful acts of officers and agents, safe-guarding rights of farmers to drive their own products to market in their own trucks and unload them with their own labor.

Since most farm products must be handled at once or rot, farmers question justification for strike by any group handling farm produce. To express approval of the Logan amendment and to tell what happened to a Batavia cooperative when it discharged striking employees, T. A. Buhl and Warren Hawley of Batavia are attending the hearings.

SLANT: Wagner Relations Act MUST be amended if farmers' rights are to be protected.

■ Relief from Relief

ON OFFICIAL carpet in Washington are WPA and whole relief set-up. House Appropriations sub-committee, appointed recently to investigate WPA, has been holding hearings to get to bottom of charges that relief is a racket.

Directing committee is Representative Clifton A. Woodrum (Democrat), who says that inquiry will center on costs and methods followed in developing WPA construction projects; special white-collar projects of WPA; WPA budgets and administration accounts; and an investigation of most "glaring examples" of WPA waste and inefficiency.

Also under consideration by committee will be such broad questions as to whether relief program should be set up on permanent basis; whether dole system ought to be substituted in

place of work relief; how Federal government should allot its relief funds, etc.

Bills to revamp relief program have already been introduced into both House and Senate. Senate bill, known as Byrnes plan, proposes doing away with WPA, and creating instead one public works agency to which would be transferred WPA projects, Public Works Administration, National Youth Administration, Civilian Conservation Corps, Bureau of Public Roads, and construction work of the Treasury.

Byrnes plan also proposes big increase in local contributions to relief, as well as making social security program carry more of relief burden. According to it, old-age pensions would start next January, instead of two years later as current law provides; also bigger payments would be made under unemployment insurance, bigger benefits for dependent children and the blind, etc. Result, it is believed, would be to take large number of persons off relief rolls.

SLANT: It is about time that searchlight was turned on relief. Relief and public works expenditures have continued to pile up each year until they now take about two-fifths of all Federal outlays. In spite of total of 21 billions appropriated for relief during fiscal years 1931 to 1939, number of persons on relief rolls has increased and WPA has failed to stimulate private employment. As long as we have needy persons, we will need relief for them—but it is not too much to ask that the government create an honest and efficient system to handle the problem.

Also getting Congressional once-over is Workers' Alliance, a union of WPA employees. At hearing last week, Herbert Benjamin, high ranking official in the organization, admitted that he belongs to Communist party. One charge made against WPA is that in larger cities its administration is dominated by Workers' Alliance. Questioning of Benjamin brought out also that some of Alliance's funds came from United Auto Workers of America, a C.I.O. union.

■ Farm Subsidies Don't Work

SUBSIDIES and more subsidies is Washington formula for return of elusive farm prosperity. It's not here yet! In mid-March U. S. farmers received 91 per cent of pre-war average prices, five points less than in March 1938. When farmers buy, that's another story; costs are 20 per cent higher than pre-war.

Cost of 1939 farm subsidies is estimated as follows:

Soil conservation program will cost \$500,000,000.

Proposed parity income subsidy, likely to receive congressional approval, will cost from \$150,000,000 to \$250,000,000.

Export subsidy, now under discussion and likely to become law, will use up about \$100,000,000. Added to this will be around \$25,000,000 from customs receipts which can be used as export subsidy.

Surplus disposal, including dairy products, fruits and vegetables, is expected to cost \$50,000,000 plus \$75,000,000 from customs receipts. Under this head comes experiment in financing disposal of surplus products through existing retail distribution

machinery (see Northeastern Slants March 18).

Ultimate cost of indirect subsidies through government loans on farm crops is yet unknown. About \$650,000,000 in government loans is now tied up in cotton with other millions in wheat and cotton.

Miscellaneous subsidies, direct and indirect, through Farm Security Administration, include grants to destitute farmers, subsistence homesteads, and loans and grants to make farm owners out of farm tenants.

SLANT: Total cost of farm program to taxpayers will be over a billion dollars. This vast sum could be justified if program worked. It doesn't. For example in 1938, cotton exports were estimated at 3,800,000 bales, lowest in 50 years. By August 1, country will hold only about 14½ million bales, with government loans on 11½ million; and 1939 crop is estimated at 12 million, making total supply 26½ million bales with prospects of marketing 10 million bales both at home and abroad. One suggested solution is barter of 2 million bales for such raw materials as tin and rubber. If bigger and better subsidies have failed to boost farm incomes to fair level, what is the substitute? That is a fair question. Answer is a higher price level made stable by managed currency.

■ Farmer's Greatest Mistake

SPEAKING to New York State Grangers from six counties, at Penn Yan, N. Y., National Grange Master Louis J. Taber said that the farmer's greatest mistake has been in thinking too much about how to reduce, balance and guide production, and not enough about how to step up the capacity of America to consume.

"It is time to face the fact," said Mr. Taber, "that the sure way to recovery is understanding—and teamwork of agriculture, business, labor and the consumer, working with government. Whenever these forces face their mutual responsibility, recovery will be at hand."

■ President Appeals to Hitler and Mussolini

DURING fortnight, President Roosevelt asked German and Italian dictators a plain question: "Are you willing to give assurances that your armed forces will not attack or invade the territory or possessions of the following independent nations?"—and then followed a long list of 31 countries in Europe and Near East. If Hitler and Mussolini would agree to this, President offered to get similar pledge from the other countries not to attack Germany or Italy; also, he promised that United States would take part in an international discussion looking toward disarmament and freer world trade.

From many nations, including South American republics, came warm approval of President's plea, though newspaper comment in some raised question of how much a new promise from Hitler or Mussolini would be worth. In a speech April 20, Mussolini rejected the President's appeal for non-aggression guarantees on the grounds they are unnecessary and that the proposal fails to consider "pyramidal errors of geography." A similar reply is expected from Hitler on April 28.

Meantime, the European democracies and the dictator countries continue to jockey for position. Britain, aided by France, has been trying to line up Russia and the smaller nations which are threatened by German and Italian expansion. Latest report is that Russia has agreed to lend her air force if war breaks out. Throughout Europe,

millions of men are under arms, fleets are at strategic points, and frontier forts are manned.

Action at Home

Government officials in Washington are busy studying and devising ways to ease shock on United States of a possible general war in Europe. Plans are being drafted to keep America's markets open in event of emergencies caused by a European crisis. "Business as usual even if there is a European war" is their slogan.

On legislative front, Congress has passed a \$358,000,000 emergency defense measure to build up United States' air force. It is expected that 3,000 planes will be completed within next two years. Goal is 6,000 planes.

Question of what kind of law this country should have in order to keep us out of a European war is subject of sharp debate in Washington. One side proposes to amend present neutrality law so as to make it possible for United States to sell munitions and other supplies to nations which are victims of aggression. Other side, in favor of strict neutrality, would make law apply equally to all nations engaged in war, whether defensive or aggressive.

■ Soft Coal Tie-Up

NEW YORK CITY has been worrying about its coal supply, consequence of shut-down in soft coal industry in East and South since March 31st. On that date, contract covering 320,000 members of United Mine Workers of America expired.

Going on since March 14 have been negotiations for new contracts between representatives of coal operators and workers. As we go to press, both sides admit deadlock, and John L. Lewis, President of United Mine Workers and of C.I.O., has threatened to call a strike in all soft-coal fields not yet affected by strike.

With serious coal shortage facing large part of transportation and industry in New York City, Mayor LaGuardia wired President Roosevelt for help to end deadlock. New York, he said, had only enough coal for a few weeks, and added that every city in East was in same boat. One large company, Consolidated Edison of New York, is reported to have placed orders for European coal in order to protect itself if shut-down continues.

Coal operators are holding out for renewal of old contract with its 5-day, 35-hr. week and \$5.60 to \$6.00 daily wage. Miners, represented by Lewis, are willing to accept old contract, but only on condition that a closed-shop provision be added, or that "penalty clause" (which imposes \$1 to \$2 daily fine on miners who strike during time contract runs) be eliminated. Operators have refused these conditions. Mayor LaGuardia, in his wire to President, pointed out that there is no dispute as to wages or working conditions.

"North Country" Business Men Stand Back of DAIRYMEN

(Continued from Page 5)

no mistake in supporting any farmers' plan which has such united support.

Of course, there is always a minority, and the minority often makes more noise than its numbers justify.

Earl Laidlaw said:

"The Rogers-Allen Law was the most constructive piece of legislation ever given to the industry. The marketing order actually worked, and that is all any dairyman or business man should want to know."

Mr. Laidlaw also pointed out the tremendous loss (in actual dollars) to dairymen due to the suspension of these orders to his own town of Gouverneur alone.

Frank Crary told the meeting that the only bottom to the milk market is the price of butter, cheese and freight, and that is the price the producers will get for the next few months, because of the failure of these milk agreements. Any plan based on a flat price just cannot be effective. The best we can do is to get the best we can for milk.

Mr. Leon Chapin, dairyman of Bangor and director of the Dairymen's League, was urged to say a few words. He said:

"Mr. Newell and Mr. Whittemore should be commended on getting this group together. We milk producers are 350 to 400 miles from the market. We must fight to protect that market. If milk becomes a public utility, and it may if plans fail, I wonder if we of the North Country will have any opportunity to produce milk. From 80 to 90 per cent of the time there is enough milk produced within 300 miles of New York City to supply the market. The Rogers-Allen Law brought together 80 to 85 per cent of the milk producing farmers of the area. Without amendments to the Rogers-Allen Law it will be impossible for the Federal order to operate effectively if reinstated. The lack of amendments has already cost the dairymen in the Buffalo area \$50,000 to \$100,000."

Following the meeting of the Federated Chambers of Commerce, Mr. Harold B. Johnson, editor and publisher of the Watertown Times, criticized the meeting because he said that both sides of the milk question were not permitted to be heard at the Federation meeting, and that the action of the Federation does not actually represent the sentiment of the North Country in the matter of the present milk crisis.

Said Mr. Johnson: "An effort was made by the Times to have both sides heard, but Mr. Van Whittemore, head of the Canton Agricultural School, apparently did not favor this."

In answer to this, Mr. Whittemore wrote an open letter to Mr. Johnson, and sent it to all the North Country newspapers. He pointed out that Mr. Johnson had been asked either to appear in person or to send a representative to the meeting and that Mr. Carl Peters, Chairman of the St. Lawrence County Dairy Farmers' Union, was also invited. He further stated that the Northern Federation of Chambers of Commerce favors the plan that worked until overthrown by legal technicalities. It has endorsed the Nunan-Allen Bill because it has already been drafted and introduced to correct those very technicalities.

"Your editorial suggests", says the letter, "an act of the Legislature setting up again the price fixing on the

PERMANENT PROFITS

Grange Promotes Summer Feeding

Extreme summer drouth, heat and flies often curtail milk production. Many successful dairymen avoid this by feeding entirely from their Grange Silos indoors. Some supplement this with night pasturing. Some conserve pastures entirely during drouth periods. An overgrazed acre is the costliest acre on the farm.

The Grange summer silo not only conserves summer crops and pastures — it also conserves profits — avoids losses! Plan for a Grange now. Let us prove to you, without obligation, how a Grange Silo will be profitable to you. Send for folder.

behalf of the producer without special privileges to cooperatives and other agencies.

"This has been tried once and failed because no state authority can control the price of inter-state milk nor repeal the economic law of supply and demand."

Mr. Whittemore is exactly right. I never saw a meeting any more fairly conducted or more opportunity given to anybody to say exactly what he thought. Mr. Albert Newell, President of the Federation, who presided at the meeting, said:

"I invited those who differ in their view of the milk situation to come and get the facts. We are a square-shooting body of men, trying to do the right thing. Both this executive committee and our agricultural committee are thoroughly representative. The meeting today was held on the fullest notice, and anyone who differs was invited to appear and present his views. It is an absolutely open meeting."

Furthermore, I take this occasion to say that the North Country and farmers everywhere owe a debt to Mr. Whittemore for the excellent and courageous leadership he has at all times exerted to help dairymen whom he knows are so badly in need of help.

—E. R. E.

Cows Say "OK" to Grass Silage

(Continued from Page 1)

ses (about five gallons) per ton is recommended for a mixture of grass and legumes. Grasses or cereals will do very well with forty pounds. For alfalfa or clover, step the amount up to eighty pounds, and for soy beans up to one hundred pounds.

Phosphoric acid has some advantages. It is necessary to apply only about one-fifth as much phosphoric acid by weight as molasses. A common recommendation is three quarts of acid per ton for grass and cereals, four quarts for mixed grasses and legumes, five quarts for alfalfa and clover, and five to six quarts for soy beans.

No special equipment is required. Phosphoric acid is not sticky and doesn't get obstinate and refuse to run at low temperatures. There is not much difference in cost between molasses and phosphoric acid, and tests show that the phosphorus which is added is returned to the soil in the manure.

Experience has developed several ways of saving labor. A windrower, costing about \$20, attached to the cutter bar eliminates the raking operation. A cylinder hayloader will handle grass by replacing the ropes with welded link chain and by reinforcing the slats. A small truck equipped with a gravity dump body reduces hauling time, and setting the cutter in a trench makes it easier to pitch the green material from a firm footing on the ground. It is important to haul the grass as quickly as possible after cutting it to prevent wilting.

Doubtless experience will develop more ways of cutting silo filling costs, but as a feed, grass or legume silage is beyond the experimental stage. Careful tests have shown that grass silage can replace corn silage and most of the dry hay in the dairy cow's ration. Grass silage is here to stay!

LOCK DOWELLING SURE GRIP SURE STEP

3 Exclusive Features!

Only in the Unadilla Silo can you have the *sure-step, sure-grip, door-front ladder*. Only in this famous silo can you have patented lock dowelling—that ties the entire structure into a tight... wind-proof silo. The Unadilla is also specially built for heavy grass silage.

Coburn Electric Fencer

saves you money increases profits

5 Year Service Guarantee

You'll appreciate the many exclusive engineering advancements a Coburn Controller provides that lessen work—give you a safe, trouble-free fence that you can depend on for every fencing job on all stock. You can manage better—get more from your fields and stock. Thousands in use by leading farmers. High line, battery, farm plant models. Write for colorful free booklet.

COBURN ONE-WIRE FENCE CO.,
3249 Main St., Whitewater, Wis.

The Oldest Established Electric Fence Company

Mr. Calf Raiser— I'LL RAISE BETTER CALVES FOR YOU AT LESS COST!

The Red Spotted Bag is Helping Thousands of Dairymen to Bigger Profits. It contains the famous Ryde's Cream Calf Meal, a scientifically prepared substitute for milk. Is specially steam-cooked, to aid digestion and decrease scours.

Try this New, Tested Way of DRY FEEDING. Ryde's Cream Calf Flakes eliminate messy wet feeding. The crisp, crunchy flakes are easy to chew and digest. Calves thrive, you profit.

FREE BOOK "Calf Husbandry" packed with practical advice on how to raise better calves. See your dealer or write to Ryde & Co., 5425 W. Roosevelt Rd., Chicago, Ill.

With **AMERICAN AGRICULTURIST**

Advertisers

Your Market Place

AERICAN AGRICULTURIST is your publication. No individual profits from *American Agriculturist*. After the expenses of getting out the paper have been met, profits are used under the direction of the American Agriculturist Foundation for research and education. Already a revolving student loan fund has been set up from which farm boys and girls in colleges of agriculture and home economics can borrow funds to continue their education.

This, together with the fact that *American Agriculturist* advertisers are guaranteed, makes *American Agriculturist* your natural market place. Read the ads. When you plan to buy nationally advertised products, ask the dealer, "Is it advertised in *American Agriculturist*?" Get the coupon habit, and send for the many interesting booklets offered by *American Agriculturist* advertisers. Here are a few in which you may be interested:

The Archer Daniels Midland Co., 602 Roanoke Bldg., Minneapolis, Minn., will be glad to send a 32-page booklet "Crusade Against Breeding Troubles in Cattle." You will find a handy coupon on page 10 of the April 15 issue.

"The Motorist's Handbook" is full of suggestions to consider when buying a new car. It is the result of questions sent out to a large number of motorists by the Customer Research Staff of *General Motors*, Detroit, Michigan.

Tioga Mills, Inc., Dept. AA-439, Waverly, N. Y., have four booklets on poultry feeding, dairy feeding, turkey feeding and hog feeding. They will be glad to send you one or all of them.

The Perfection Stove Co., 7113-A Platt Ave., Cleveland, Ohio, have published "I Have Found the Best Way to Cook." In addition to helpful suggestions, this illustrates a full line of Perfection oil-burning stoves.

Ryde & Co., 5425 W. Roosevelt Rd., Chicago, Ill., in "Calf Husbandry" give hints and practical advice on raising better dairy calves.

Papee Machine Co., Shortsville, N. Y., have assembled up-to-date information on grass silage. The booklet is called "Grass & Legume Molasses Silage—An Outline of Its Development."

Firestone Farm Service Bureau, Akron, Ohio, have a new 72-page farm guide book. This book is completely indexed and contains many short-cut methods of solving farm problems. Ask your Firestone implement dealer for a copy, or write directly to Akron for it.

The Federal Land Bank of Springfield, Mass., has available a set of timber measuring sticks which they are offering

Cesar De Bruges, an imported Belgian stallion owned by Dygert Bros. of Springville, N. Y. This stallion was foaled in 1933 and brought to this country in 1936. He weighs 2250 lbs. and took the blue ribbon as 4-year-old at the National Belgian Horse Show, Waterloo, Iowa, in 1937.

Dygert Bros. also own Malouin, foaled April 15, 1934, and brought to America in 1936. Malouin weighs 2150 lbs., and was a prize winner at the Chicago International in 1936 and 1937.

at cost. This outfit consists of cruising stick, scaling stick, and instruction book, and costs \$1; or the scaling stick alone costs 35c. They will be sent postpaid if you will send orders to Miss Dorothy Bliss, Federal Land Bank, Springfield, Mass.

Two New York Guernseys, according to word received from the *American Guernsey Cattle Club*, have been named as eligible to be among the thirty chosen from the best of the breed to form the Guernsey contingent in the herd of 150 Purebreds that will be on display from April until October in The Dairy World of Tomorrow, a Dairy Industry Exhibit sponsored by *The Borden Company*.

The cows, selected as eligible by the Guernsey Representatives, are:

"Greystone Royal Anne," with a production record of 9653.8 lbs. of milk and 502.7 lbs. butterfat, owned by Messrs. L. S. Riford and T. M. Staples; and

"Valleyview Improvers Charity," with a production record of 11,855.5 lbs. of milk and 598.5 lbs. of butterfat, owned by Mr. J. Earl Scott of Dansville.

The Dairy World of Tomorrow is to be one of the striking exhibits at the 1939 Fair. Here 150 dairy cows, each a queen on the basis of her type and performance, will be on exhibit. These cows will be selected by the Breed Associations representing the following breeds—Jersey, Guernsey, Holstein-Friesian, Brown Swiss and Ayrshire. These cows will be milked three times daily on a Rotolactor—giving the public a chance to observe the most modern methods in handling milk. In addition to the cows mentioned, representative calves and a bull of each breed will be on display.

Here is a new use for one-wire electric fence. Made by the **PRIME MANUFACTURING CO.**, Milwaukee, Wisc., this fence is used to keep deer out of an alfalfa field in Florence County, Wisc. The fence is attached to trees by porcelain insulators and metal discs are attached at frequent intervals. These discs, swaying in the breeze, appeals to the deer's curiosity, but one or two contacts teach them to stay away.

NEARBY MARKETS for NEARBY POULTRYMEN

What Price Eggs? BY J. C. HUTTAR

IHAVE generally looked upon the merchant who sells eggs for less than other merchants do, on the same sizes and grades, as a very desirable fellow. I figure that low retail prices bring heavy consumption, heavy consumption leads to strong wholesale demand and that works toward higher prices and low storage holdings. I guess most folks in the egg business figure the same way.

J. C. Huttar

Eggs Must Be Eaten

Most of you probably remember the serious and unsatisfactory egg price situation in the winter of 1936-37. It really started just about at the turn of the year. While the rapid and drastic drop in egg prices (with poultry mash costing \$3.00 a hundred or more) was chiefly due to very mild weather conditions, the high retail price of eggs which prevailed didn't help matters any. Retail merchants got some very unfavorable publicity as high handed profiteers in the city papers and price slashing began immediately. Egg consumption picked up right away, helping to relieve the situation. Heavy government purchases for relief distribution, of course, also eased the downward pressure of wholesale egg prices.

Following the low point in annual fresh egg production sometime in October or November, there is always the task of adjusting egg values downward in order to attract customers back who cannot afford the real high prices, and therefore quit eating fresh eggs. When prices go up customers are quickly lost but they come back more slowly when prices start downward.

The ideal situation for the egg producer is when wholesale prices are reasonably good and when the retail mark-up is small. In this way the greatest egg consumption for a given wholesale price can be obtained. Heavy consumption is always beneficial to the egg producer.

Hotels and Restaurants

One link in the egg distributing chain that has always been weak in this country has been the restaurant and hotel combination. The two things that get people eating a lot of eggs are low prices and high egg quality.

Taken as a group, many restaurants and hotels have sinned in both respects. In the wholesale egg market a restaurant egg is known as one of second or, more often, third quality. In the matter of price, well, most of you have had your own experience. Go to a restaurant and order a couple of poached eggs. They'll cost you anywhere from 25 to 50c, depending on the style of restaurant you are in.

My friend, Art Masterman, of Ithaca, who is associated with the G.L.F., does a lot of traveling and has always been keenly interested in the welfare of farmers. He has collected for me the menu cards of a number of up-state hotels. They're mostly the special breakfast menus. What do I see? Here's a fairly typical one:

In the 30c club breakfast you can have either fruit or cereal with toast and coffee.

In the 40c breakfast you can have fruit and cereal with toast and coffee.

But you have to spend at least a half a dollar if you want eggs for breakfast and then you only get one if you want a little ham or bacon with it.

On another menu card I see among the luncheon and dinner suggestions that an omelette will cost you 75c while a tenderloin beefsteak is only 95c. Quite out of proportion to their cost, I'm sure.

In Canada

I was talking on this subject with Dick Graham, who is head of the Poultry Department of the Ontario Agricultural College at Guelph, Canada. He told me that they had the same problem up there.

I don't recall who he referred to as "we", but this is about the way I remember Dick's words.

"We found that most restaurants used good, large eggs when they were cheap, but switched to storage eggs in the late summer, fall, and early winter because they could still get large eggs at a low price. We sold them on the idea that a fresh, medium sized egg was more acceptable to their customers than a storage large. We also got some of them to be more reasonable in their charges on eggs. It has increased the sale of eggs in restaurants more than you'd think."

Dick (Professor W. R. Graham) is an accurate and fairly conservative gentleman. So this is quite a bit for Dick to say.

Let's think about this a little.

Invest 2 to 6 cents

About forty states have reserved space for educational exhibits at the World's Poultry Congress at Cleveland next summer. New York, one of the greatest egg producing states, hasn't.

Bills are now before both branches of the legislature at Albany providing for an appropriation of \$12,500.00 for such an exhibit. If you New York poultrymen want to be thus represented at Cleveland, why don't you write a very short note either on a penny post card or in a letter to each of these two men:

Honorable Oswald D. Heck, Speaker,
Assembly of the State of New York
Albany, N. Y.

Honorable Joe R. Hanley, President,
Senate of the State of New York
Albany, N. Y.

You might say something like this:

"As one of New York State's thousands of poultrymen I feel that a good state educational exhibit at the Seventh World's Poultry Congress this summer would be of benefit to our industry."

"I respectfully urge you to aid the passage of the bill now before the Senate (Assembly) to provide funds for such an exhibit."

A MAW FALLS FOR THAT DYNAMITE IN THE HANDLING WOOD EVERY APRIL 15

NEARBY MARKETS for NEARBY POULTRYMEN

Disinfectants

By H. L. COSLINE

WHEN bacteria or viruses or other causes of disease are present in an incubator, a brooder house or the soil it is "infected". When the "infection" has been destroyed the place is "dis-infected". A "disinfectant" is anything that destroys infection.

There are many disinfectants. Some will destroy some kinds of infection, but not others. Very few disinfectants are effective against all infections. Lye, for example, is often thought of as a disinfectant. It is true that it will destroy many kinds of bacteria. It does not kill coccidia. So it is not a satisfactory disinfectant for a brooder house or laying house. For loosening the dirt and cleaning the brooder house it is an excellent help. For disinfecting the house something more is needed.

For killing coccidia (the organisms that cause coccidiosis) probably nothing is equal to heat. The main difficulty with heat is that no one has given us a really satisfactory way to use it. Boiling water will kill coccidia instantly, but by the time you get it onto the floor it is no longer at the boiling point. The fire gun throws a flame that kills everything it touches, but the flame only reaches the surface. It cannot penetrate into the cracks. I wish someone would invent an inexpensive light-weight boiler with hose attachment to blow superheated steam into the cracks and crevices of the brooder house.

Sunshine is a good disinfectant but has too many limitations. Lime has been overrated as a disinfectant.

The following is quoted from a bulletin from the Ohio Experiment Station. I think it gives the more important and essential facts about disinfectants for poultry farm uses.

"Crude Carbolic Acid.—Crude carbolic acid has been used to some extent in the disinfection of poultry houses, but it can not be recommended because of the fact that commercial crude carbolic acid is not uniform in strength and may or may not be effective. It certainly has no advantages over other disinfectants which can readily be procured.

Liquor Cresolis Compositus—U.S.P.—Liquor cresolis compositus is one of the cheapest and best known disinfectants on the market. It can be secured from a druggist and should be purchased as liquor cresolis compositus. The United States Bureau of Animal Industry recommends this material to be used in a 2 to 3 per cent solution with water.

The advantages of this disinfectant are that *weight for weight it is more efficient and cheaper than is pure carbolic acid.* It is readily soluble in water and its soapy character permits good contact with oily or greasy surfaces. Care should be taken to mix this with soft water because of the fact that there may be a sufficient amount of calcium in hard water to prevent its going into solution readily.

Emulsified Coal-Tar Disinfectants.—There are available on the market numerous commercial brands of coal-tar disinfectants which, when mixed with water, produce a milk emulsion. The value of these products as disinfectants varies greatly, and there is no way by which the poultryman can test or be sure of knowing their bacteria killing powers. However, it is possible to secure from the United States Bureau of Animal Industry a rating on all of these products. This rating is called the "phenal coefficient." These materials vary from a coefficient of .5 to as high as 20, so it can readily be seen that it is advisable to know some-

thing of their strength.

The Bureau of Animal Industry has published a complete list of these permitted disinfectants. This list can be secured from the Bureau at Washington, D. C.

The efficiency of these coal-tar disinfectants is greatly increased when used in hot water and applied at a high temperature."

The "Liquor Cresolis Compositus" discussed above is the common "Cresol Solution." It is one of the best all-around and least expensive disinfectants. It will destroy even coccidial infection if kept in contact for 5 hours or more.

By J. F. (DOC) ROBERTS

HORSES and springtime are natural. The farmer is beginning to curry, clean and wash, and the city man is beginning to shine up his riding boots. Incidentally, the very great increase in interest in the saddle horse and riding as a sport, is beginning to show in horse production and breeding.

The horse is like any other animal and should not be rushed into anything. This means that you should begin to prepare him now for the heavy work ahead. He should be fed some grain so that he will shed out promptly and thoroughly. He should be exercised and exercised regularly whenever grain rations are stepped up, this to avoid azaturia, or "blackwater" as it is known. This common trouble will hit a horse very suddenly with a paralysis of the hind quarters, usually when worked hard after a heavy grain ration, following a lay-up of even a day or two. If you are in a position where you cannot exercise your horses every day under these conditions, get them out in the lot where they will exercise themselves.

If your horses have been tied in all winter, it is very probable that their front feet have become too dry and too hard to stand heavy work, and that their back feet have become too soft. Under these conditions, a week or ten days out on the ground, after careful paring, shaping and cleaning, will put their feet in excellent shape. Should they be so soft and have been subjected to so much moisture that they even

"I wonder how many they're going to keep!"

smell very offensive, you probably have a case of "thrush". Oftentimes this is indicated by almost a tarry, offensive exudate, and the horse may go very lame on one foot or all four feet, particularly after he has worked an hour or two. In this case, any foot so affected should be thoroughly cleaned, soaked with a disinfectant pack, which can be kept on the foot for about twelve hours at a time. Usually such treatment, when followed by dry, clean quarters, will clear up the trouble, but if it does not, a doctor should be called, because it can be cured, and should not be allowed to exist or continue.

Beware of so-called "shoulder lamenesses". It is very seldom that a horse is lame in the shoulders. The trouble is in the feet in 90% of all lamenesses, and this will emphasize the importance of foot care. The question of whether you shoe a horse or let him go barefoot, depends entirely on the type of use to which you are subjecting the horse, and as to whether you are working him on a stony, rough, gravelly farm, or on a soft, loam farm.

Sleeping sickness in horses, which has caused such devastating losses in some sections of the country in the past few years, may or may not hit your community inasmuch as it is spread by a fly or mosquito. There has been developed a very satisfactory vaccine, produced from a chick embryo, which will practically immunize all of your horses against this disease, and it is now available, and at a comparatively low cost. Consult your local veterinarian in regard to this disease, always remembering that "an ounce of prevention is worth a pound of cure."

Collar sores and saddle sores cause the greatest economic loss every summer, and both are entirely unnecessary under any conditions. If you do not know how to fit a collar on a horse properly, do not play with it, and do not use any old collar. Use good collars, fitted by a man that knows, and then keep that collar clean and keep your horses' shoulders clean. Exactly the same thing applies to the saddle, and if you do this, you will have not only a contented, but a useable, serviceable horse all season.

In buying a horse, particularly a Western horse, insist on a trial before you pay your money, of at least a day or two. If the horse is right in every way, the seller will not hesitate to do this, and there is no reason why you should "gyp" or be "gypped" in buying or selling a horse.

Grain Smuts Are With Us Always!

(Continued from Page 7)

have plans for the construction of a very inexpensive treater.

If a grower knows approximately the amount of seed needed for planting, only this quantity should be treated. Any excess cannot be fed because the chemical New Ceresan is poisonous and cannot be removed from oats and barley. The seed need not be discarded, however, because a germination test the next season will show if it is suitable for planting after prolonged storage. The degree of injury depends largely upon the method of storage. In tight sacks or bins there is little chance for escape of the gases and these in time will injure the seed. Ordinary coarse burlap bags are ideal for keeping treated seed for a long period.

The rate of chemical has a much greater effect upon seed injury than the type of storage does. This is the principal reason for recommending only 1/4 ounce of New Ceresan to each bushel of oats or barley. The grower is protecting himself against smut and also avoiding a treatment that will injure his seed. If he is delayed a week or even a month in planting no harm will be done.

Wonderful Success

Raising Baby Chicks

Mrs. Rhodes' letter will no doubt be of utmost interest to poultry raisers who have had serious losses raising baby chicks. Read her experience in her own words:

"Dear Sir: I see reports of so many losing their little chicks so thought I would tell my experience. My chicks, when but a few days old, began to die by the dozens. I tried different remedies and was about discouraged with the chicken business. Finally I sent to the Walker Remedy Company, Waterloo, Iowa, for a 50c box of Walko Tablets. They're just the only thing to keep the chicks free from disease. I raised 700 thrifty, healthy chicks and never lost a single chick after the first dose."—Mrs. Ethel Rhodes, Shenandoah, Iowa.

Danger of Infection Among Baby Chicks

Readers are warned to exercise every sanitary precaution and beware of infection in the drinking water. Baby chicks must have a generous supply of pure water. Drinking vessels harbor germs. Drinking water often becomes infected with disease germs and may spread disease through your entire flock and cause the loss of half or two-thirds your hatch before you are aware. Don't wait until you lose half your chicks. Use preventive methods. Give Walko Tablets in all drinking water from the time chicks are out of the shell and you won't lose one where you have lost dozens before.

You Run No Risk

Buy a package of Walko Tablets today at your druggist or poultry supply dealer. Give them in all drinking water from the time chicks are out of the shell. Satisfy yourself as have thousands of others who depend on Walko Tablets year after year in raising their little chicks. You buy Walko Tablets entirely at our risk. We guarantee to refund your money promptly if you don't find them the greatest little chick saver you ever used. The Waterloo Savings Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of our guarantee. Sent direct postpaid if your dealer can not supply you. Price 50c and \$1.00.

Rochester Chosen to Try Out New Surplus Distribution Plan

(Continued from Page 10)

grocers who accept them for food. Surplus or blue stamps will be redeemed by the Government from funds already available to the Federal Surplus Commodities Corporation. These are the same funds now being used to purchase surplus commodities for donation to State welfare agencies.

Stamp books, similar to those used for postage stamps, and including both orange and blue stamps in a ratio of two to one, will be made available for purchase by eligible persons in Rochester at places to be designated. The value of the orange stamps in the book will range from \$2 to \$10.

Surplus food products for which blue stamps will be used have not yet been officially designated, but some of those on the list are expected to be the same as those which the Corporation has purchased and distributed in the past, including probably butter, grapefruit, oranges, dried fruits, beans, and eggs. Fresh vegetables might be added, as they come into surplus later during the season.—Dewitt C. Wing.

Egg Deal Looks Brighter

Estimated storage holdings of eggs on April 8 were 1,452,000 cases, 262,000 less than a year ago. On the same date, stocks of frozen eggs were estimated at 67,113,000 lbs., nearly 34,000,000 lbs. less than a year ago.

The egg-feed ratio for the week ending April 13 was 8.9. A month ago it was 8.3, a year ago 8.4, and two years ago 11.1.

A late season has retarded egg production, resulting in a stiffening of sentiment about the situation. Egg buyers feel that the season is too far advanced for any sudden spurt production to be maintained for a long time. Production has been heavier than a year ago, but consumption has also been better. Also, more eggs have been hatched than a year ago. The guess is that cold storage holdings will exceed last year's figures, but by a smaller margin than was expected.

CORRECTION

Omission of three ciphers on page 1 of the April 15 issue changed 912,000,000 pounds of milk to 912,000 pounds. The statement should have read:

"On those farms there are in round numbers 152,000 dairy cows, producing 912,000,000 pounds of milk per year, returning to the dairymen of this district alone from \$15,000,000 to \$18,000,000 annually."

A new kind of toyland, made famous at New York State Fair last Fall by the Saratoga County Home Bureau. Read the story on this page about the County's unique project, "Care of Children at Meetings."

--And Bring the Children!

By MABEL HEBEL

TEN YEARS ago, the Saratoga County Home Bureau started something which is still going and promises to spread much farther. This is what happened: At a Family Life Conference held at that time by the County Home Bureau, one of the questions which got a lot of attention was how mothers of young children could manage to attend such meetings. Said the mothers, "We need these discussions on family relationships, family health, and child study, but either we have to bring our children to the meetings or else stay home to take care of them."

Bringing the children to meetings had not worked out well. It was hard for the leader to give a lesson with interruptions taking place constantly. The mothers had to divide their attention between the children and the lesson. As for the children, they got tired and cross and caught each other's colds. So the County Home Bureau decided to provide a special playroom for the children, with a nurse to inspect them on arrival for possible contagious diseases, and a grown-up to supervise their play. However, at the first meetings where this plan was tried out, troubles arose. The mothers had to bring the toys from home, and this was not practical because many of the toys were breakable and their small owners didn't always enjoy sharing them with the other children. Also, it was not always easy to get a trained person to look after the children.

Finally, the County Home Bureau worked out in cooperation with the New York State College of Home Economics a plan which has been gradually perfected during the past several years. It was decided to train a Home Bureau member in that county especially for this work. Mrs. Harold Jennings, of Ballston Spa, N. Y., was chosen and sent to Cornell University, where she took a course in nursery school procedure. There she also learned to make the sturdy, homemade, washable toys and habit-building

equipment which have become such an important feature of Saratoga County's "Care of Children at Meetings" project. After completing her training at Cornell, Mrs. Jennings worked with various local Home Bureau groups in her county, demonstrating care of children at meetings and the construc-

A man's sock, a yard length of broomstick, buttons for eyes, fingers of worn-out gloves for ears, and strips of leather or shoestrings for bridle and lines, make this stick horse. (From Cornell bulletin No. 360)

tion of the toys. In telling me about her experiences, Mrs. Jennings said:

"The mothers were sold on the idea after seeing their children safely and happily engaged, while they themselves could enjoy the meeting. As a next step, each group called a special toy-making meeting; arranged for a local nurse, school nurse, or a Home Bureau member with nurse's training to inspect children who came; and appointed some adult who had had Home Bureau training in child study to supervise the children at the meeting."

"We always have a good time at the toy-making meetings, for many fathers as well as mothers come. When the toys are finished, they are kept in a big basket or box which can be transported easily to meetings."

"During meetings, the children play with the toys in a room or sunporch where they will not disturb the group's discussion. Of course, in nice weather, the children take the toys outdoors. All the toys are sturdy, safe, hygienic

and are washed after each meeting. They are planned to meet many needs and to encourage various types of play—social, dramatic, active, creative, etc. The children love these occasions and learn to share and to take turns, and the timid ones learn to play with the others. Their parents observe them and talk with the county leader or adult who gives help informally. The nurse has a chance to do a little health education among mothers, teaching them to detect danger signs."

"In the last 5 years, groups all over our county have asked for lessons and exhibits of these homemade toys which are recommended by Cornell. Each of these local groups now owns its own set of toys and equipment. And not only Home Bureau groups see the possibilities in this project. Study groups that meet in the afternoon, women's clubs, missionary societies, book clubs, P.T.A. groups, Sunday Schools, nurses at orthopedic clinics, etc.—all are seeing how to keep children happily engaged while mothers are busy learning at group meetings."

If you went to the New York State Fair at Syracuse last year, you probably saw Saratoga County Home Bureau's attractive exhibit based on this project. (See picture on this page). The story of the project was told with large picture posters arranged in the background and a collection of homemade toys and children's books in the foreground. Children who came to see the exhibit were thrilled to be allowed to go in the booth and play with the toys. Even the little chairs provided for the youngsters were especially chosen "good posture" chairs.

Parents as well as children took time out to examine those gay, sturdy, "do-with" toys. There were brightly painted wagons, trains, boats, spool boards, doll beds, tin cans nested, doll furniture, tables, chairs, easels, bean bags, bean bag boards, ring toss, hoops,

sand boxes, peg boards with pegs, pyramid blocks, puzzles, airplanes, stick horses—all contrived out of cheese boxes, spools, cigar boxes, chalk boxes, dried fruit boxes, lard pails, tin cracker and cookie cans, odds and ends of soft smooth wood, handles of old

Doll's cradle made from a jumbo grape basket, with rockers cut from a board and screwed on. Bamboo splints or wire make the canopy. Cradle can be painted, or the basket padded and covered with a fitted washable slip-cover of swiss or gingham scraps. (From Cornell bulletin No. 360.)

brooms, orange crates, grape baskets, yardsticks, or what have you! So fascinated were State Fair visitors by the idea that they could make these toys at home at little or no cost that over one thousand families left names and addresses, asking that they be sent a copy of the Cornell bulletin which gives directions for making the toys, entitled "Homemade Playthings and Materials to Promote Success in Routine Activities."

The Saratoga County Home Bureau, located at Saratoga Springs, N. Y., or the Family Life Department of the Extension Service of N. Y. State College of Home Economics, at Ithaca, N. Y., will be glad to help any group which is interested in trying out a plan similar to the Saratoga one.

Flare the SOFT SKIRT

WHILE the two-piece silhouette is in high favor for tailored things, the flared skirt is important for crepes and similar materials. Shirrings and puffings in dressy dresses and plenty of tucks in suits and dresses are right up to the minute.

The bodice has a fitted look with waistlines constantly growing smaller and smaller. Jackets, belts, gloves, bags, veils, hankies and flowers all help to introduce a luscious bit of color.

JACKET DRESS PATTERN No. 2522 is charming when made up in navy and white print crepe with a cyclamen-pink crepe jacket for contrast. The jacket would go equally well with navy or black and could have a scalloped edge if desired. The dress and jacket patterns are also serviceable for gay striped or figured cottons

"You're watering the wrong flowers, Grandpa—here's the window box!"

or piques for warm weather wear. Pattern sizes are 11, 13, 15, 17, and 19 years. Size 15 requires 2 7/8 yards of 39-inch material for dress; and 1 yard of 39-inch material for bolero and sash.

GIRL'S FROCK PATTERN No. 2531 is as sweet as childhood itself, with shoulder yoke and shirred-on skirt. It may have long or short sleeves and be worn with or without a belt, with or without pockets. The pattern which also includes panties, comes in sizes 2, 4, 6 and 8 years. Size 4 requires 2 1/2 yards of 39-inch material for dress and panties with 1 1/2 yards of ribbon. Embroidery pattern E-11175 for smocking costs 15c extra.

TO ORDER: Write name, address and pattern size and number clearly and enclose 15c in stamps. Address Pattern Dept., American Agriculturist, 10 North Cherry St., Poughkeepsie, N. Y. Add 12c for a copy of our new spring fashion catalog.

Divide Clumps When Growth Starts

AS SOON as growth starts is the best time for separating delphiniums, phlox, Shasta daisies and chrysanthemums which have made large clumps. Chrysanthemums, as we have said many times and often, are better if the new young shoots on the outside

Resurrection

By MARION GOODWIN.

Long has the dead earth lain
Locked in an icy tomb.
Now life flows back again,
And the world springs into bloom
As Spring comes forth from Winter's bed
To show how Christ rose from the dead.

of the clumps are taken to start this year's new plants. The possible exceptions to the annual transplanting of chrysanthemums are the low-growing cushion varieties.

Last year my border of azeleamums, part of which had been left undisturbed, gave a very interesting exhibition of effects of transplanting, also of the effects of full sunlight and part shade. Although there were some flowers on most of the plants from mid-summer on, the height of bloom varied early or late according to location or whether the plants had been moved. Therefore this year I shall not move any of the plants in that border; then we shall see what we shall see!

Clumps of other varieties will be separated as usual. Shasta daisies are separated in the same manner as chrysanthemums.

I was certainly fascinated last fall by the blossoms on one of the so-called iridescent varieties of chrysanthemum, Symphony. It had an unusual rose-pink color with large, well formed

double flowers.

My experience with Korean chrysanthemums grown from seed has always given me a big thrill. If you are not in too big a hurry for results, there is even time for planting such seeds. They would not bloom this year, of course, but would yield perfectly good plants for another season's bloom. Growing your own plants is less expensive, but requires time, care and patience.

Clumps of phlox usually have to be cut apart with a garden spade or a heavy knife. The woody center is discarded since the newer growth around the edges furnishes the best flowers. A trick to get a succession of bloom in the phlox border is to pinch back the shoots on some of the plants while they are still quite short.

Glad corms may be planted any time now. It is far better to plant them at intervals of ten days to 2 weeks and have a succession of bloom, rather than have them all come in at once. Some ambitious people plant "glads" early in pots and set them in a cold frame; then when the weather is warm enough they can be transplanted into the garden, disturbing the roots as little as possible.

There is no need to put dahlia roots in the ground until it is well warmed, probably around the middle of June, but seeds of dwarf dahlias may even yet be planted in a frame or indoors. Many people are growing these smaller dahlias altogether since they flower in one season from seed and do not present the problem of overwintering which the larger varieties do.

Our European Tour Starts July 28th

IF YOU have not already done so, I write us today for a copy of the printed itinerary of American Agriculturist's wonderful, all-expense tour to seven European countries this summer, July 28-August 24. You may use the blank printed below. The price of \$497.50 includes everything except your passport and personal items such as laundry. Sailing from Montreal, we will go direct to bonny Scotland, and from there visit the most famous and interesting places in England, Belgium, Holland, Germany, Switzerland, and France. One of the high spots of our

tour will be a motor trip out from Paris to the historic Chateau of Versailles, built by King Louis XIV. The above picture shows a corner of the magnificent gardens which surround the palace.

If you are thinking of taking the trip with us, we urge you to make your reservation at once, as we must limit our party to the accommodations which we have engaged in advance. Later, should you find that you are unable to go, or if it is necessary to cancel the tour on account of events in Europe, the full amount of your deposit will be refunded.

Dear Mr. Eastman:

I am interested in your European Tour, July 28-August 24. Please send me, without any obligation on my part, full information regarding the trip, with complete itinerary.

MUFF — A Serial Story

By C. A. STEPHENS

THE STORY THUS FAR

Muff's real name was Henry Nemo, but the name "Muff" stuck because his mother tucked him into an old muff when he was a few days old and abandoned him on the doorstep of the home of two old maiden ladies. Against their desires, the Selectman persuaded Mary and Marcia to keep the boy. As he grew, a crimson birthmark around his neck was noted by the village gossips and referred to in whispered tones as "the gallows mark". On reaching school age, Muff was a silent boy. He developed a great ability to train animals, first evidenced by his training an old gander to drive the family cow home from pasture.

His next venture was taming skunks, of which he had to dispose after the town drunkard had a disastrous encounter with them. Muff then turned to training two calves to the yoke and cart. He exhibited them at the fair, and was so successful with his show that Marcia, after many offers, received \$80 for them, although ordinarily they would have brought only about \$25! At that time Muff was 13 years old.

* * *

CHAPTER III.

MUFF FELT very badly at having his educated steers sold. He wanted to keep them, and continue training them, so as still further to astonish people at the Fair next fall. He told Mr. Murch that he thought he could teach them to harrow and cultivate a field without a driver, to make the correct turnings at the corners of their own accord, and to go through various other complex movements. It is to be regretted that he was not able to try the effects of such continued training.

But old Marcia was much in need of the money, and as the price offered for the steers was a large one, her friends advised her to sell them.

People now said, "What will Muff do next?"

The winter passed rather idly with him; he seemed discouraged; no doubt he missed his steers very much. At school he used to spend much time drawing objects on his slate, particularly such things as wheels and windmills. Although now in his fourteenth year, he still continued to be a reticent and rather shy boy, not very strong, and of a delicate and sensitive nature.

In the spring Marcia hired him out for the season with a farmer named Glinds living four or five miles away; he was to work for six months at seven dollars per month. It was a hard place for him. The farm was a large one; and Glinds himself was a hard worker; he was what his help called a "man-killer." Marcia probably did not know how severe an ordeal Muff was to go through.

The lad went to Mr. Glinds's in the middle of May. Thenceforward he had to be out of doors at four in the morning to milk the cows, and attend to feeding the calves before breakfast. Then from six till twelve o'clock, he worked in the field, with other hired men, and was expected to keep up with them at planting and hoeing—even though he received but half pay. No one got out of the field at Mr. Glinds's till sunset, and then 15 or 20 cows had to be milked, and the calves and hogs fed again. Often Muff, being the "boy", had to go on some errand, so that it would be long after dark before the tired lad could get even a chance to sit down. Moreover, the food was of the coarsest quality with little variety; and while the other hands were allowed coffee, Muff was expected to drink water, on the ground that "coffee is bad for boys."

Muff endured this severe discipline six weeks, till the Fourth of July. On the morning of the Fourth, he asked his employer for a holiday.

"No," said Mr. Glinds, "there was no bargain made for letting you off on the Fourth."

"But the other hands are going to have the day," Muff urged.

"Wal, they reserved it in the trade," was the reply; "you didn't."

So Muff worked at hoeing potatoes alone all through that long hot day; and at night had ten cows to milk because the other hands were away.

This was on a Saturday. Next morning, after chores, Muff went home to get his clean clothes, as was his custom on Sundays, and refused to go back. Nor could Marcia persuade him to do so.

Monday night Mr. Glinds rode over to inquire why he had not returned, being no doubt desirous of keeping him. Muff obstinately refused to go back with him; and Glinds, on his part, refused to pay a cent for all he had done thus far, though he did not deny when asked about it, that Muff had worked well. But he would not pay him anything because he had not worked the full time for which he was hired for, as he worded it, he "had run away."

It must be remembered that this was Muff's first experience in working out by the month; he did not say much about it; but it was plain that he had fared hard. He kept at home and by himself for some time afterwards. People said they guessed that Muff had left farming and taken to fishing, for he was seen frequently at the old saw-mill, on Stony Brook, about a mile from the Corners. Several of us older boys, going there "pickereling" one rainy day in haying time, found that the old water-wheel had been repaired, also the gate and flume, and while looking about, we came upon Muff himself, rigging a pulley and a little jig-saw in a caddy behind a pile of slabs. He laughed bashfully when we examined his saw, and said he was "only fooling a little." The saw-mill had been abandoned, and the board saw taken out some years before.

Once in October the writer with a

friend went to the old mill to see what Muff was doing there. We could not find him, though we surmised that he was not far away; for it was said that when he heard any one coming, he slipped out of sight. We found not less than a dozen little machines of one kind and another, and a lathe for woodturning. Down in a caddy, beneath the floor of the old mill, in the midst of great heaps of sawdust, we found a sort of shelf, or table, on which stood a jug of molasses and a bag of crackers. It looked as if he boarded himself down under there.

He kept so much out of sight that people well-nigh forgot him; through the fall we saw absolutely nothing of him; but with the first snows, he came around from house to house, drawing a hand-sled with a large box on it, in which were packed a stock of rolling-pins and gingerbread creasers, which he offered for sale at ten cents each. These were his own handiwork, and were well-executed specimens of woodturning.

He did not come to school that winter; and after a time Mr. Dennett, one of the school committee, and Mr. Murch, who was again one of the selectmen, went to the mill one day to inquire into it, and urge him to come. They found him just loading up his sled with a fresh stock of woodware. In reply he said that he must keep to his peddling, to get food for himself and old Marcia. So he was allowed to take his own way.

But being alone so much, and, perhaps, brooding on his wrongs, seems to have been a bad thing for him.

In April of the following spring came a rumor which occasioned a sensation. Mr. Glinds—the farmer for whom Muff had worked the spring before, and who raised large crops of oats which he usually kept till the rise in price the following spring—found that one of his large grain-bins, which had been nailed up the fall before with a hundred bushels of oats in it, was nearly empty. The granary was in his new barn, directly over the large open barn cellar. The thief had cunningly bored a large hole up through the floor, from below, and tapped the bin from beneath. The grain had thus been drawn out with the greatest ease into bags. The granary was securely locked; but there was nothing to prevent a thief

The Amateur Poet's Corner

Expectation

Spring has returned
In the drops of rain,
Clean sweep.

Spring has brought with her
Bursting buds,
Root deep.

Spring has waked the earth
From her long,
Dark sleep.

And who am I to say
What the Fall
Will reap?

—M. Kathryn Bacon,
Ludlowville, N. Y.

from going into the barn cellar beneath it on any night.

The theft and the ingenuity displayed in it created a great stir among the farmers; and after a time Mr. Glinds got information that a boy had for weeks been in the habit of taking oats in a bag on a hand-sled to a store at Rich's Ferry, four miles away, and there exchanging the grain for groceries. The store-keeper gave a description of the boy. It fitted Muff exactly. Mr. Glinds got the sheriff, and taking the store-keeper, drove straight to the old mill. Approaching it cautiously, they surprised Muff at work. The store-keeper identified him; and a search disclosed two bags of oats buried in sawdust. There were also found stored away under the floor, half a barrel of crackers, four salt fish, a cheese and two gallons of molasses.

When threatened and charged with the theft of the oats, Muff said very little. He did not deny the accusation. Mr. Glinds, a rough man, began berating him, when Muff, with a great burst of indignation, exclaimed,—

"I worked hard to sow those oats, and you 'most starved me to death; and then when I couldn't stand it any longer, you cheated me out of my pay!"

This was as good as admitting the theft. Lest he should run away, the sheriff seized him, and a warrant for his arrest was procured later in the day.

The first that old Marcia, or any of the folks at the Corners, heard of the matter, Muff had been taken to the county jail, ten miles off. Mr. Murch, his wife and Marcia rode over there the following day to see him; and it was said that he made a full confession of the theft to them.

In jail! Only a year before the whole county had rung of Muff and his wonderful skill with his steers. Now—how fickle is popular opinion!—now people said the "gallows-mark" on him was beginning to show out; that the gallows would have its own yet; that he was a little sly, thievish scamp, and they had never liked his looks.

There was a great deal of curiosity now to go over to the old mill where Muff had been captured and see what he had been about there. Really, it was quite a sight!—the end of the mill which had been partitioned off with slabs, for his shop. There was his lathe and "jigamarines," as people called his other odd machines. One man said that he counted up 62 wheels there! A large number of rolling-pins and "creasers" were stowed away in

The Song of the Lazy Farmer

WHEN I was young my mother would, in spring, to keep me feelin' good, just fill me up with sulphur and molasses, for you understand, it thins the blood and purifies and puts new brightness in your eyes. At least that's what my mother said; it clears your liver and your head, and so I had to take the stuff, she never thought I had enough. But now I've got a better plan, Mirandy stews up in a pan a mess of greens, 'most anything can be made into greens in spring, they're mighty tasty too, and so, you ought to see the way I go for greens, they may be only weeds, but they're just what my system needs.

The livestock knows what's good for it, they paw around and have a fit, at fences they will make a pass, they're crazy for a taste of grass. The springtime sunshine puts a kick in grass that's growin' lush and thick, the vitamins or carotin or such that Nature has put in to that there grass

is just the thing to fill us full of zip in spring. Us people too need stuff like that to help rid us of winter's fat, in fall I don't mind pork and beans, but just now all I want is greens. It beats all how them greens take hold, they make me frisky as a colt, they lubricate each joint and bone until I doubt if they're my own; the biggest thing that springtime means to me, is fillin' up on greens!

Spring Prayer

By M. KATHRYN BACON.

God,
When Spring
Comes down
This long and winding road,
Let me wait
With outstretched arms
To take her in!
I would not miss
One robin's "cheerio,"
Nor one flashing
Wing of bluebird.

Don't let the lilac
Bloom without me!
Don't let the violet
Push the leaves aside
Without me!
I pray you, Lord,
To let my eyes
See May-flowers
E'er they've come and gone.

Don't let Spring
Come and go
Without I see
Her footprints
In the melting snow.

the mill. Then, too, there were tops and cups and rings and vases of wood.

Everything about his work had such a neat, painstaking semblance, that no one had the heart to molest anything, and had the judge who presided at Muff's trial visited the old mill, I fancy his heart might have been softened.

The trial came off at the Corners the forenoon of the 7th of May, before Justice Whitmore.

When questioned, Muff, who looked very woebegone after his three weeks in jail, admitted that he took the oats.

"You knew that it was stealing?" asked the Justice, who seemed inclined to question him somewhat.

Muff made no reply. The Justice then repeated his question harshly, whereupon Muff turned suddenly—

"Call it stealing if you want to!" he cried, in a perfect burst of grief. But that old skinflint—pointing to Mr. Glinds—"stole my hard work away from me first."

In broken but passionate sentences he then told the story of his work and his treatment at Mr. Glinds's farm. It made quite a stir in the audience. Mr. Glinds visibly winced under it.

"I stayed there just as long as I could stand it," continued Muff. "When I left, he owed me ten dollars and fifty cents. Not a cent would he pay me. I took just twenty-six bushels of oats from his bin, and I got forty cents a bushel for them. That comes to ten dollars and forty cents, and he still owes me ten cents."

"But you knew that such an act was stealing?" persisted the Justice.

"Yes," replied Muff, more calmly, "I suppose I did." But he still clung tenaciously to that idea of taking just enough grain to come to ten dollars and a half, no more.

Old Marcia was present, and wept

in silence. Mr. Murch said all that he could in Muff's favor. The trial lasted about two hours. The Justice consulted with the selectmen of the town, and it was decided to send Muff to the State Reform School at Cape Elizabeth. This decision was communicated to him, and he was taken back to jail prior to his removal to the school, which is, in reality, a penal institution.

AND now, with my nobody's boy in the reform school, many readers may think that my story may as well end; but I shall not leave him there; even a reform-school boy may retrieve his errors and do well in after life; and I only wish that I had already told the worst about Muff.

Mr. Murch, who had done what he conscientiously could in Muff's behalf, now offered to take him to Cape Elizabeth and be responsible for his safe delivery at the school. But the sudden death of one of his sons from diphtheria, prevented him from doing so, and the task fell to Sheriff Markhead.

The distance was about sixty-five miles; and the sheriff intended to take Muff in a wagon with him, handcuffed. But a difficulty arose; no one of the three pairs of handcuffs which he had would fit him, each being so large as to slip off over his hands. There was no "Black Maria" in this rural county for the transportation of prisoners. Mr. Markhead was a rude, pig-headed man with very little regard for the feelings of persons so unfortunate as to fall into his hands; and the way he got over his present difficulty was by hiring an old meat-cart, with a dirty canvass top, to carry Muff off in. For greater security, he had four stout bars put across the rear end of it. Into this foul old cart he thrust his prisoner, and then took his seat at the forward end, to drive, feeling pretty sure that he could not get out past him to escape. But I do not believe that Muff would have tried to escape if he had been decently treated, or asked to give his word not to do so. Markhead treated him like a wild beast at the outset.

The novel turnout attracted a crowd at the jail; and it was cheered and hooted out of town. Yet a more pitiable spectacle I can hardly imagine; and I do not doubt that Muff felt that he was tasting the last dregs of the cup of degradation and shame.

Owing to delay in fitting out this singular equipage, they made but twenty-five miles the first day, and stopped for the night at the Elm House, in the town of A—. After watching Muff eat his supper, the sheriff locked him into one of the servants' rooms, in the attic of the house, to pass the night, and to preclude all possibility of his levitating, he came in after the lad was in bed and took away his clothes—everything.

Nevertheless, when he unlocked the door of Muff's room in the morning, he found it empty. (To be continued)

Grange Gleanings

(Continued from Page 2)

project is designed to offset the severe hurricane damage to shade and fruit trees in the Bay State last September.

* * *

THE WISDOM of erecting the New England Grange Headquarters Building on the Eastern States Exposition grounds at Springfield, Mass., is made apparent, and in addition to its use during Exposition Week in September, plans are under way for a big mid-summer field meeting, expected to draw a vast audience from three or four states and with National Master Louis J. Taber the expected speaker. Other events at the building scheduled for the season are a Pomona rally night, June 2, and a tri-state Church-Grange service in the early fall.

Kernels, Screenings and Chaff

By H. E. BABCOCK.

ON MAY 8 there is to be a nationwide recognition of the signing of the Smith-Lever Act which twenty-five years ago established extension work in agriculture and home economics. In connection with the observation of this date, extension services everywhere, so I am told, plan on taking inventory and securing a new grip on a forward-looking program.

Without realizing what it was all about, I was one of the early workers in setting up farm bureaus and in organizing extension work in New York State. I have never had reason to regret this activity and today I unhesitatingly place the work of county farm and home bureau agents, 4-H Club leaders, and the services of extension specialists from colleges of agriculture and home economics second only to the price level itself as a constructive force in determining agricultural welfare.

At the same time, I think I see some very real dangers ahead, and for what it is worth I would like to warn those who are now engaged in extension work all over the country not to get the cart before the horse. The activities of county farm and home bureaus, the influence of 4-H Club leaders, the teaching of extension specialists—are all means to an end. They never must become an end in themselves.

The end, as I understand it, is to raise the standard of living on farms and to enhance the spiritual value of farming as "a way of living". This end in itself is so desirable that any nation can afford to spend a reasonable amount of public funds to help accomplish it.

It is an end, however, which in the last analysis must be achieved by the men and women themselves who live on farms. The machinery which the Smith-Lever Act started off twenty-five years ago can at most render timely and incidental aid.

Therefore, let us as farmers at this time highly resolve to keep the major part of the command in our march of progress in our own hands; let us build stronger county farm and home bureau associations; let us originate more projects for the improvement of farm and home locally, and let us so deal with those public servants who work with us that they will never be permitted to substitute an agricultural bureaucracy for the type of extension service which helps and aids farmers but never dominates or regiments them.

* * *

1939 Silage Plans

Our combined feed ideals for Sunnygables and Larchmont are briefly these:

- (1) Four large silos full of *high carotene* silage.
- (2) Three hundred tons of green, leafy first and second cutting legume hay.
- (3) Three to four thousand bushels of

wheat and barley for poultry and livestock feeding.

- (4) At least 150 tons of chopped straw for bedding.

SILAGE EXPERIENCE

Although I am always careful not to state too definite opinions about farming on this page, I feel pretty sure of myself about grass and legume silage. I'm going to speak of it as hay silage from here on.

For the past five years we have made a lot of hay silage. We have put it up untreated, and treated with both mo-

ful corrosion, probably because we never rinse it off with water. We have a hunch that silage made by the acid method will consistently show a higher carotene content than molasses silage.

SOYBEANS FOLLOW HAY

In the future we will not cut much of our new seedings for hay silage but will mow fields which have been down two years or more. As soon as we have the grass crop off these fields—they will be top-dressed in the winter—we will plow them and plant them to two bushels of Cayuga Soybeans to the acre. We are also starting a *permanent* field of corn on each farm right near the barn. In the fall we will harvest our beans and use the corn we raise to mix with them to fill our two remaining silos and refill those filled in June with hay silage. *By using our corn to mix with the beans we will avoid buying both molasses and phosphoric acid,* and by growing corn permanently on the same field we will not upset our hay-soybeans-winter grain rotation. As soon as the beans are off we will disc the fields and sow them to wheat and winter barley.

The effect of this plan we hope will be to give us what we most need for feed, with a minimum of expense, namely:

- (1) Two silos filled in late May and early June with hay silage treated

Appropriately enough this Angus steer is named Kernel. Owned by the Department of Animal Husbandry at Cornell University, he is a full brother to our Sunnygables herd sire, Eisa Corneller. On the day the picture was taken he was just one year old and weighed 865 pounds.

Professor Hinman of Cornell tells me that he is selling a full sister of this steer in the May Angus sale at Ithaca.

lasses and phosphoric acid. *One conclusion is that while it can be done if all conditions are just right, untreated hay silage is too risky to be practical. Another conclusion is that excellent hay silage can be made by both the molasses and phosphoric acid methods. An expert cannot tell the silages apart.*

PHOSPHORIC ACID PREFERRED

On each farm in late May and early June we plan on filling one silo with hay silage. We shall use phosphoric acid to make this silage for these reasons: *We need phosphorus* on both farms and we have so much hay carried over that it would be foolish to buy more feed in the form of molasses. The acid is easier to handle. We know that it does not harm our chopper because after putting hundreds of gallons of acid through it our machine has been studied by experts *who report no harm-*

with phosphoric acid. The manure from the animals fed this silage will be used to top-dress our winter grain so it will get the benefit of the phosphorus.

- (2) Two cuttings of new seeding hay—or one cutting and a crop of clover seed on some fields—plus some good fall pasture for livestock.
- (3) Good yields of wheat and winter barley.
- (4) A lot of straw and the time to pick it up after the grain is combined.
- (5) Two silos filled in the fall with a mixture of soybeans and corn, for which we will make no cash outlay.

Following early cut hay made into silage with soybeans enables us to get two crops off a field (hay and beans) in a season and to build a good seed bed for winter grain, *all with one plowing.*

We submit this adaptation of the use of grass silage in Northeastern agriculture for what it is worth.

In our case it (1) permits us to get the jump on our haying regardless of the weather; (2) permits us to use the phosphorus we buy in the acid to preserve the silage in place of superphosphate on our winter grain; (3) gives us always a supply of silage for supplementary feed in case summer pastures fail because of dry weather; (4) spaces our work well during the summer; (5) substitutes machine labor for men; (6) gives us maximum annual production of legumes.

* * *

The Hinds' Steer

You may recall the picture of the giant steer I printed a few weeks ago. It was claimed he weighed 4,617 pounds; stood 21 hands high, and measured 25 feet from tip to tip.

Well, naturally the figures raised a lot of discussion and Frank M. Smith of Springfield Center, set out to check up on my statements. Through Ulysses G. Welch of Edmeston, N. Y., he got in touch with Mr. Spencer B. Pope of New Berlin, N. Y. Mr. Pope remembered the steer and wrote Mr. Smith on April 4th as follows:

"If the picture of Hinds' Steer that appeared in the March 18th issue of the *American Agriculturist* was taken in the year 1874, as stated, I was nine years of age. I doubt the statement that it was five years old at that time, as it was not too long lived. I would say its age at that time when the photo was made was not over three years.

"My parents were living in the 'Goodrich School District' near the school house about one mile north of the Hinds' farm at the time this steer was born. I would have been about six years old at that time.

"The steer's mother was an ordinary sized cow of the Durham breed that predominated in Reuben Hinds' herd and its sire was the regular bull. It was just one of the common run of calves when born, probably weighing 90 to 100 pounds. For some unknown cause (perhaps an extremely large pituitary gland) this calf gained size and weight very rapidly, which Mr. Hinds fostered until it gained the massiveness that made it the wonder of all who saw it.

"The height stated as 21 hands is not far out of the way, for my father was six feet, one inch tall and I have seen him stand beside the steer's front legs and he could just comfortably reach up his arm and lay his hand on the steer's shoulder.

"The weight given below the picture also denotes the steer had not reached over three years of age, for it is a matter of record that before his death—that was reported as caused by smothering in a boxcar during transportation on the railroad—he reached the weight of 4,838 pounds. . . ."

Well, what do you skeptics say now?

MORE BIG ANIMALS

Touched off by what he heard about the Hinds' steer, A. H. Austin of Ithaca, N. Y., writes:

" . . . it reminds me that I once saw in Burlington, Vermont, an ox that they claimed weighed 5,600 pounds. That ox was seven years old and carried oodles of fat that this picture does not show.

"This steer probably had as much frame as the 5,600-pound ox. Also at St. Albans, Vermont, a yoke of oxen, one weighing 3,000 and the other 4,000 pounds."

Mr. Austin also enclosed a letter from one Martin Berg, Kiron, Iowa, which gives the following figures on a Poland China hog: 123 inches long, 100 inches around body, 66 inches around neck, 26 inches wide across back, 48 inches high, weight 1,400 pounds.

SEASON CLOSED

In the interest of the continued veracity of this page I herewith declare a closed season on big animal stories.

Good Money After Bad

"A year ago the 17th of March a man by the name Stanley came to my house and claimed he was working for the Oil Company of Oklahoma, of which my mother had a five hundred dollar royalty. He claimed she owed \$600 about which she knew nothing. He said that was why the monthly payments were so small. By paying the \$600, he would be able to sell the royalty and make money on it for us. I gave him \$300 and he said he would put in \$300. He promised to be back the last of May or the first of June last year, and I have not as yet heard one word from him. He didn't give me a receipt or anything to show that I gave him \$300. I think the man was a fraud and pocketed my money. I would like to know if you could locate this man, and help to get my money back."

If any reader knows where Mr. Stanley is, we would be much pleased to have this information. The chances are that he can not be located and even if he can, the evidence against him is small, in view of the fact that our subscriber has no receipt. No comment appears to be necessary regarding the danger of giving cash to a stranger, in fact having any dealings with him until his identity is established and there has been time to consider the whole deal. Very often, people who have made unfortunate investments are persuaded to hand over more money on the argument that this will save the original investment. Our grandfathers called it "throwing good money after bad."

It's a Contract

A roofing story which may save some reader money has just come to our attention. An out-of-town contractor called upon one of our readers and obtained a contract to put a roof on her house for \$765. The roof was put on and she signed a certificate of acceptance. The note was then sold to a bank and being what is known as an "innocent third party" was able to force collection. However, a lawyer friend, by bringing some pressure to bear was able to get a settlement of \$600., the contractor refunding the \$165. to the bank. To complete the story, a local contractor said the job should have cost about \$450.

From considerable correspondence from readers we suggest the following precautions:

- (1) Check the price of a construction job with several contractors.
- (2) Investigate the reliability of the concern before signing the contract.
- (3) Read the contract and be sure you understand it.
- (4) Do not sign the certificate of acceptance until the job is satisfactory.
- (5) Realize that when the contract is sold to a bank the full amount is legally collectible by them.

Chickens Shrank

The other day a subscriber stopped in the office to tell us a story. Said he: "It may save someone from doing what I did."

Here is the story:

"Two poultry buyers drove in with a truck. We had some hens that weren't laying and thought we might as well sell them. I was a bit suspicious and checked their scales against mine and found that they were all right. However, after they had gone, we checked the number we had sold and found from the estimated average weight that the amount which we were paid was at least 15 per cent less than it should have been. I couldn't prove it in court, but I am sure that their scales were manipulated in some way."

Recent Service Bureau correspond-

ence has contained several similar stories. Of course, poultry buyers are not all dishonest, but these experiences certainly indicate caution and close checking when selling to a man you do not know.

Pictures

With the advent of spring, agents for picture enlarging concerns are again traveling the roads. If one should stop at your house, we suggest you consider these facts:

1. There is nothing to the lucky envelope scheme. Be assured that if you are asked to draw an envelope with the promise that if you are lucky you will get a reduced price, you are certain to be "lucky".
2. Usually the agreement says nothing about framing, but when the finished work is delivered, it will be in a frame and you will be subjected to high pressure selling to get you to take it.
3. If you don't like the finished product and refuse to pay for it, there is no way you can force the concern to return the original. A good many letters from subscribers indicate that they were not pleased with the finished product.
4. The chances are that a hand-colored photographic enlargement from your local photographer, plus a frame will cost you half as much.

Law Caught Up

Daryl Doran was sentenced on November 10 in Pennsylvania to serve a two-year term, and is now in a prison in Lewisburg, Pa. Doran operated a number of so-called associations, companies, publications and businesses in Chicago; and was indicted in Federal Court in Chicago on October 1, 1937, for using the mails to defraud. The Post Office Department states that they cannot be of assistance in effecting the return of manuscripts or money sent to Mr. Doran.

As we have pointed out many times in the past, the Post Office takes action to prevent use of the mails, but this does not mean that the subscriber will get his money returned.

Guarantee Backfired

"What can you tell me about the Civilian Preparatory Service, Inc., of Huntington, West Virginia? My son signed up and took a course, paying \$10 per month, paying \$80 in all. He had made all of the payments and nearly completed the course. He was given to understand that he would be given a chance to take Civil Service exams and guaranteed a job. However, the last lesson which they sent him, he worked out and returned as usual and it came back marked 'out of business'. If he did not get a job the agreement said they would return the fees. Is there anything to do but forget it?"

I'm sorry but you can do nothing. This is one reason why we have always advised against putting too much dependence upon promises to get a job. If the company goes out of business there remains no one you can force to make good on their promises.

Keys Found

An old Orange Judd key ring No. 313599 has been found. The owner may redeem it at Meyer's General Store, Augusta, N. J.

These key rings were given by American Agriculturist when published by Orange Judd. At that time there was a list of names and numbers so that keys could be returned directly. This list is no longer in existence which explains the reason for this note.

LETTERS FROM NEW JERSEY

Flanders, N. J.,
January 14, 1939.

Dear Sirs:

I wish to express my appreciation for check from North American Accident Insurance Co. for my recent auto accident.

I recall five years ago when I obtained this protection, that it took my last dollar. I consider this the best investment I ever made.

Very truly yours,
WATSON T. SUTTON.

Mr. Sutton was injured on December 4, 1938, in an auto collision. He sustained a fracture of the nose. He was totally disabled for one week, and received \$10.00.

Franklin, N. J.,
Nov. 10, 1938.

Dear Sirs:

I want to thank you most sincerely for your kind consideration and prompt payment of the \$130.00 claim I presented, which helped meet my many expenses.

Am very glad to have had this policy which I had taken only a few months previously and assure you my husband and I will always keep protection with your Company.

Sincerely yours,
(Mrs. Alfred) TERESA ROMYNS.

Mrs. Alfred Romyns was injured on June 15 when a bee flew in the window which caused the driver to lose control of car, which ran into a stone wall. Mrs. Romyns received a cut leg and injured spine. She was laid up 13 weeks and received \$130.00.

Newton, New Jersey,
January 11, 1939.

Dear Sirs:

I wish to thank you for your check of \$10.00, paying for the time I was laid up as a result of injuries sustained from auto accident on October 23, 1938. I have carried this insurance for three years. This is the first claim I have filed. I received prompt and courteous attention. Thanking you, I am

Sincerely,
THOMAS J. HARDIN.

T. J. Hardin was injured when the automobile collided with a telephone pole as a result of a tire blowing out. He received a cut over his eye, and was totally disabled one week. He received a check for \$10.00.

Keep Your Policy Renewed

Meet Mr. Gagnier

The gentleman who is studying the potatoes so intently is Ed Gagnier, senior partner in the firm of E. G. S. Gagnier & Sons of Churubusco, N. Y. Ed has studied potatoes closely all his life, and on his Clinton County farm he grows the largest acreage of N. Y. State Certified Seed Potatoes in New York.

All of this acreage is grown for certified seed stock and is sold throughout the Northeast. Last year Gagnier was able to plant in the latter part of April, but this year the season is so backward that he does not expect to plant until late in May. He will put in 75 acres of Green Mountains, 75 acres of Chippewas, 25 acres of Cobblers, and probably some others. His average yield over a ten-year period has been around 400 bushels to the acre.

How He Does It

Gagnier follows his potatoes each fall with a rye cover crop, fertilized with 300 pounds of 32% Gran-Phosphate per acre. In the spring he plows in the rye and uses 1000 pounds of 8-16-16 on his potatoes. His saving this year through the use of a high analysis mixture will reach from \$800 to \$900. He has used high analysis mixtures for the last eight years, and for six years he has used nothing but G.L.F. fertilizers. The G.L.F. Reporter asked him why.

"That's a fair question," replied Mr. Gagnier. "I'll say this—G.L.F. fertilizer is a good fertilizer. It does a splendid job. I find it is pretty consistently in good mechanical condition. It is priced well below any fertilizer of comparable quality and I certainly cannot complain about the yields I get with it. I always get first rate service and in addition I appreciate the move G.L.F. made in packaging fertilizer in 100-pound paper bags. They save fertilizer and labor as well as money. Of course I found out long ago that it pays to use higher analyses."

Spraying Is Important

Gagnier says that potato farmers, in order to be successful, must spray early and keep on spraying. "I don't wait for the bugs and blight, I put on an early spray whether flea beetles are there or not, and I get on plenty of copper right at the beginning. It is well to have the copper there before the blight strikes. Because we put our potatoes in bins for storage through the winter I have been able to observe that good spraying practices increase the keeping quality of the stock."

In The Old Days

Gagnier recalled the time when the north country was one of the most important shipping centers for potatoes. This was 30 or 40 years ago. Almost every farmer in his vicinity raised some potatoes for market. In those days they were shoveled in bulk without grading into cars. He believes two things were among the important

reasons for the decline of this industry—reluctance of the farmers to adopt grading practices and careful spraying programs. He thinks that potato growers would be better off economically to practice careful grading and packaging so that their individual brands would easily be recognized as first class goods.

In growing seed Gagnier practices a few different methods than the average potato farmer. His seed is cut by machinery. He drops one piece every 9 inches in rows measuring 34 inches between.

Potatoes make better seed stock when they are not allowed to fully mature. Because they are dug slightly green the greatest care is exercised in handling the stock to prevent bruising and scuffing. He stores all his potatoes in one large insulated storehouse in open bins. As orders come in for seed stock the bins are graded out.

One of Gagnier's sons works with him on the farm. Two others are in college preparing for professions.

Practical Suggestions for the Small Grower

Well-drained loamy soils produce brighter skinned, better shaped, higher quality tubers. Deep plowing is essential for the formation of a better root system that will support larger plants and larger yields.

Fertilizer

If fertilizer is applied by hand, care should be taken that it is well mixed with the soil so that it does not come into contact with the seed. Best results with potato planters come from applying fertilizer in two bands on the same level as the seed piece, but separated from it by at least 2 inches of soil on either side.

In New York the recommended rate of application on sandy soils not manured is 1500 pounds of 5-10-10 fertilizer to the acre. 800 pounds of 8-16-16 will save money and labor. For heavy loam soils without manure use 1200 pounds of 5-10-5 or 600 pounds of 10-20-10 to the acre.

In New Jersey the recommendation is a ton to the acre of either 5-8-7 or 5-10-5. In Pennsylvania for early potatoes, 800 to 1200 pounds of 5-10-10 on moderately fertile land; for late potatoes, 640 to 800 pounds of 5-10-10 per acre.

Seed Handling

Use certified seed; it is free from virus diseases and tests prove it returns larger yields. Ordinarily seed should be treated with a mercury compound treatment (except where scab is a problem) before green sprouting and before cutting. In cutting seed remember that the size of the piece is more important than the number of eyes to the piece, and that the quantity of seed to the acre is more important than either. Cut so as to divide the eyes at the bud end, and cut squarely into chunky pieces with a minimum of surface cutting. For best results place 1½-ounce seed pieces 12 inches apart in 34-inch rows. This will require 24 bushels of seed to the acre.

The Growing Crop

Early season cultivation is usually more efficient and less costly. Get the weeds before the vines start to spread between the rows. Ridging or hilling is generally practiced, but where rainfall is limited a level culture is recommended.

Spray early. Do not wait for bugs or blight. To prevent blight use a wet spray of 10 pounds copper sulphate and 5 pounds spray lime to 100 gallons of water. For potato beetle control add 5 pounds of calcium arsenate. Thorough and timely spraying will increase yields.

This huge insulated potato storage house has two floors and bins that reach from top to bottom, easily accommodates 80,000 bushels of potatoes for winter storage.

A four-row potato planter with fertilizer attachment pulled by a tractor covers from 175 to 200 acres of potatoes quickly on Gagnier's Clinton County farm.

AMERICAN AGRICULTURIST

FIVE YEARS FOR \$3.00 — THREE YEARS FOR \$2.00 — PUBLISHED EVERY OTHER WEEK

ONCE considered an unimportant sideline of the farm business, the hen is now coming into her own. Last year she responded to scientific methods of housing, feeding and management by returning American farmers 1-1/4 billion dollars to put the poultry industry in second place as a contributor to farm income.

The hen is efficient but modest, and too often the spotlight of public interest has been focused on wheat, cotton and other products to her neglect. But at Cleveland this summer, from July 28 to August 7, the hen will set forth her claims to greatness before representatives of some 60 foreign countries and poultrymen and consumers of America. This will be the Seventh World's Poultry Congress, but the first ever to be held in this country.

The Congress is not merely a poultry show,

Your World's Poultry Congress

See It At Cleveland, July 28-Aug. 7

By H. L. COSLINE

Five main buildings with twenty acres under roof will house the World's Poultry Congress which meets in Cleveland July 28 to August 7, 1939. Here are shown some of the features of the grounds: (1) *Hall of Live Poultry*, covering an area of 92,720 sq. ft. (2) *Hall of Nations and States*, covering an area of 73,164 sq. ft. (3) *Hall of Youth*, center of all activities of youth groups. (4) *Cleveland Public Auditorium*, which will seat 15,500 people in the main arena. (5) *Automobile parking areas*, providing ample facilities for over 200,000 cars. (6) *The Mall*, adding scenic beauty to the Congress surroundings. (7) *The Underground Exhibition Hall*, one of the finest of its kind in the country. (8) *Cleveland Municipal Stadium*, built with a seating capacity of 80,000 people. (9) *Passenger Boat Docks*, affording perfect convenience for adequate transportation facilities at the Congress. (10) *The Horticultural Gardens*, one of the scenic wonders to be witnessed at the Congress. (11) *Terminal Tower*, one of the finest, most modern railroad terminals in the United States.

★ *Hotels*, showing the convenience to Congress activities.

(Right) — An inside view of *Cleveland's Public Auditorium*. This will house the scientific meetings of the World's Poultry Science Association, which will be attended by official delegates from at least sixty nations.

a gathering of scientists, a judging contest, or a school. It is all of these things and many more. Every poultryman who can plan to attend will be well repaid in entertainment and information. In the *Fall of Live Poultry* you will find over 10,000 birds representing every known breed and variety. Over half the commercial exhibit space in the five-acre *Hall of Industry* has already been sold, and here will be demonstrated the latest equipment, methods and practices in all phases of the industry.

Boys and girls are going to have a big part in the Congress, and perhaps your boy or girl or a group from your neighborhood will be there. Provision is being made for a youth camp, a separate hall for exhibits, judging contests for various groups, and poultry demonstrations by vocational students of agriculture, 4-H Club members and Boy Scouts.

In the past the World's Poultry Congress has usually been staged and financed by the government of the country in which it was held. A different plan will be followed this summer. Funds for the Congress will come from two principal sources—the sale of exhibit space and the purchase of membership tickets by poultrymen. The federal government and most states are (Turn to Page 19)

FARMERS DEMAND BETTER PROTECTION IN WAGNER LABOR LAW—SEE PAGE 3.

Fair Prices for Our Milk mean PROSPEROUS BUSINESS COMMUNITIES

Every business man in every business community in this milk shed should carefully study the two pictures above. They tell a sincere story of what A LIVING PRICE FOR MILK means to business as well as what it means to dairy farmers.

We farmers want a decent standard of living for our families. Every business man who supplies our needs can prosper **ONLY** when we get A LIVING PRICE. Therefore, our problem becomes the problem of all our business friends in rural communities.

Mr. Business Man

Here's a partial list of the things farmers are ready, anxious and willing to buy IF THEIR MILK CHECKS ENABLE THEM TO DO IT.

Some farmer may bring this page into your place of business. He may discuss with you what it means to you both for farmers to get a living price for milk. He may ask your active and enthusiastic support in this drive organized farmers are making to gain the legal right to set the price on his milk. For remember that **ONLY** by united effort can we **BOTH** win.

A fair milk check will enable farmers to buy these and many other things:

Electric power
Electric milking
machines
Electric refrigerators
Electric appliances
of all kinds
Washing machines

Farm implements
40 Gallons of paint
Dental care
Automobiles
Trucks
Radios
New clothes

Lime and fertilizer
Fences
Furniture
Building Supplies
Feeds
Seeds
Etc., etc., etc.

Look again at the two pictures. On the one side a fair return for milk has built a prosperous farm home. Prosperous farm homes mean a prosperous business community. On the other side, **WITH NEEDS JUST AS GREAT**, a home of distress because of low milk prices. Dilapidated farm homes mean a dying business community.

For a few months this winter we farmers were **LEGALLY** allowed to set the price on our milk. In every rural business community debts were paid and business was good. Then temporarily dealers regained the power to fix prices. You know what has happened since—competition among farmers and starvation returns for milk.

Now we are battling to regain the legal right to fix the price of our milk. Every business man should be our active partner in this great effort. For our success means prosperity for **BOTH** farmers and business men.

For twenty long years the Dairymen's League has fought this same fight. For twenty years we have argued that **ONLY** by united effort could the dairy farmer put the price tag on his milk. For twenty years we have been fought by the same anti-farm **GANG**.

Today most farmers and many business men appreciate how important this fight has become. Today responsible farmers are refusing to be divided—refusing to fight against other farmers. And if we stay **UNITED** the dairy farmers of this great milk shed will **AGAIN** win the right to say what must be paid for our milk, and this success will mean **PROSPEROUS FARMS AND PROSPEROUS RURAL BUSINESS COMMUNITIES**.

FARMERS

Demand Better Protection
in WAGNER LABOR LAW

By E. R. EASTMAN

DURING the last year we have reported many times the attempt of C.I.O. organizers and other radicals to fasten their choking tentacles upon agriculture. Even yet few eastern farmers realize what a menace this kind of labor organization is to their business. Western Coast farmers have had plenty of sad experience, and have only been able to survive by strong farmer organization against the attempts of radical labor to control the farm business.

I have reported how various farm products, like hay and milk, in the west and other parts of America, have been declared "hot" and the farmers warned not to attempt to deliver these products until they were unionized.

In New York State you will recall the fight of the bean growing and marketing farmers at Batavia against the C.I.O. and how these farmers, through their organization, the G.L.F. Produce Company, were cited before the Labor Relations Board. Aroused, the farmers ordered the manager of the bean picking factory to discharge its C.I.O. help and put in machinery.

You will recall the article in *American Agriculturist* last winter of the doctor, delivering milk from his farm to another New York upstate city, who was having his barn repaired with non-union help. He was told by labor leaders to hire union help or he could not sell his milk in the city, and further, his practice would be ruined. He discharged all of his help and ceased repairs on his barn.

All of these un-American activities have been made possible under the Wagner Labor Relations Act, administered by the Labor Relations Board.

Such a storm of protest has arisen against both the act and its administration that Congress has been overwhelmed with requests to modify the act and the power of this board. Hearings before a congressional committee are now in progress, and manufacturers, and farmers, and even some labor leaders themselves, have appeared at these hearings to ask various amendments.

To make sure that the point of view of the northeastern farmer is represented, Mr. Warren Hawley, a Master Farmer of Batavia, and Mr. T. A. Buhl, a farm owner and lawyer at Batavia, are going to Washington to appear before the committee and tell from their personal experience what happened in the Batavia cooperative bean growers picking plant. Both of these men were members of this cooperative, both are well able from ability and experience to speak emphatically on the menace

of radical labor to agriculture and to ask that farmers be better protected by law.

Testimony at the congressional hearing is usually given by question and answer, but the main facts which Messrs. Hawley and Buhl hope to present to Congress are printed in the two statements given here:

Statement of Mr. Warren Hawley at Congressional Hearing to ask for amendments of the Labor Relations Act better to protect agriculture.

MY observation of the Labor Union invasion of the agricultural field has caused me great concern. I have heard unbelievable reports from some of my friends in the West in regard to the Union's activities. This extension of Union activities struck our cooperative bean processing plant at Batavia last year. The first thing we knew the women bean pickers had joined the C.I.O. and were demanding \$2.50 per day or an increase from 5c to 7c per pound of cull beans picked out. They also demanded recognition of the Union.

We farmers were nonplussed, having worked long hours through all kinds of weather to grow and harvest our beans and get them into our cooperative warehouse.

To illustrate our position, I wish to quote you a few figures from the summary of farm cost accounts as published in Cornell Bulletin No. 395. This summary of the accounts of better than average farmers in New York State indicates that for the three year period from 1935 to 1937, inclusive, the cost of all labor including the skilled workers on our farms was 30c per hour. During this same period, dry beans returned to the farmers, to pay for labor above the other cash expenses, only 26c per hour, or an actual loss of 4c for each hour spent on beans.

The survey of bean dealers indicates that the average pickout of cull beans and trash from our crop over a period of years is 5%. An increase, therefore, of 2c per pound for picking out this material increases the cost per bushel for marketing by 6c. I realize that this does not sound like much money, but it decreases the return per hour of labor on the crop of beans by 2 3/4c, or more than 10% of the total returns per hour received by the farmer. This increase also increases the loss per hour of labor on the crop by almost 70%.

Our market since 1936 for beans has been badly demoralized. In 1938 the situation was worse, and we did not even expect a living wage from the crop. To our horror bean pickers were asking more money for picking out the cull beans and trash than we as farmers were receiving for growing the crop and assuming all the hazards of weather and market.

We have no fight with the Union, but how can we pay more for the unskilled labor of picking in view of the situation I have just outlined to you?

The Union would not concede a single point in their demands. We were warned that we must be very careful in what we said to them because it might be used against us if our cooperative was cited by the Labor Board. My neighbors were "sore" and decided to put in some machinery to take the place of this hand labor and

None of Our Business!

THE other day a famous surgeon said to me: "All those who would hurry America into war should see what some of us old doctors have seen—the halt, the lame and the blind, the lives ruined in mind and health, as a result of the World War."

All those who fought in Flanders now know that all of the sacrifice of money and young lives was in vain. The world has been in a tail-spin ever since the World War because of it, and another great conflict will bring the final crash.

Think what it would mean to mankind if the billions of money that went into the war, and that now go into armaments, to say nothing of the sacrifice in lives and health of young men, had been put to the constructive uses of man! Think of all that we could have that we don't have because of war!

There never would be any war if people did not forget the cost from one generation to another; but the young people, having no knowledge of the sad experience, respond to the jingoism and the hurrahs disguised in the name of patriotism. So they march away to die or to become disillusioned.

America has been the loser ever since it forgot the advice of our forefathers never to mix in world diplomacy. Our present administration is making the same mistake. It is too belligerent. War for defence, yes, of course; for offence, never! America should mind its own business on this side of the Atlantic, of which it has plenty, and should stay out of European affairs.

Business Men Support Agriculture

ONE OF the brightest spots in the present discouraging milk marketing situation is the constructive support of business and professional men expressed through many Chambers of Commerce.

As reported in our April 15 issue, the Batavia business and professional men, led by the Batavia Chamber of Commerce, started this present movement to get back of the dairymen in their present fight for a living price for milk. Among other things the Batavia Chamber adopted a very emphatic resolution endorsing the Nunan-Allen bill without amendment. Following this, as reported in our last issue, twenty chambers of commerce of the great North Country of New York, through the Federation of Chambers of Commerce of Northern New York, also adopted a resolution, urging the Legislature to pass the Nunan-Allen Bill, and sent Mr. Van C. Whittemore personally to Albany to urge the legislators in the name of the Federation to pass the Nunan-Allen Bill.

On this same subject, Mr. Lewis H. Cheney of Jamestown, Chautauqua County, writes:

"Every Chamber of Commerce should be made acquainted with this milk issue. I approached the Jamestown Chamber of Commerce after I heard what had been accomplished at Batavia, and they adopted a strong resolution."

I am very proud of the fact that the Chamber of Commerce in *American Agriculturist's* home city of Ithaca enthusiastically adopted a resolution in support of the Nunan-Allen Bill without amendment. There are probably several other Chambers of Commerce and other organizations of business men who have done the same from whom I have not heard.

Such interest and constructive support of agriculture on the part of business organizations is

of far reaching importance not only for dairymen but for every farmer and for every business man. It means recognition on the part of business men of the tremendous importance of agriculture and of the dependence of all of us upon the prosperity of the farmer. Also it works both ways, for agriculture has need of business and the two of them in a cooperative team can accomplish a program which will mean much to everyone concerned.

I urge upon every business and farm leader to follow this beginning, to arrange for meetings and for discussions of mutual problems which will lead to better understanding and to real progress.

Favorable Decision Hoped For

AS THIS is written, dairy leaders of both New York and New England are in Washington to listen to the evidence being presented before the Supreme Court of the United States for and against the Agricultural Agreement Act under which milk marketing agreements are being administered all over the United States except in New York, where Judge Cooper declared the act unconstitutional. Decision is expected before the end of June and a favorable decision is expected. In that case milk marketing agreements will continue in many milk sheds and will be restored in New York if the Nunan-Allen Bill is finally passed by the New York Legislature.

In New England, if the act is declared constitutional, over \$2,000,000, which has been held in escrow since the court fight started, will be paid to New England dairymen. Coming at a time when dairymen are so sadly in need of money, what a Godsend this will be.

Congratulations

OUR GOOD wishes to Mr. Graham Patterson, publisher of the Farm Journal of Philadelphia, for acquiring and adding to this old publication the Farmer's Wife of Minneapolis, and for making Wheeler McMillan editor in chief of the combined Journal.

Both the Farm Journal and the Farmer's Wife have long been constructive influences for good in American rural life, and the leadership of Wheeler McMillan is assurance that the combination of these large rural publications will continue to support and work for the best in country life.

Sheep in the Northeast

IN THE early days the Northeast was a great sheep country with many flocks in almost every farm neighborhood. But with the opening of the western ranges farmers of this section could not compete. Our land was more valuable for other farm enterprises.

However, times and conditions have changed, and many farmers are wondering if sheep husbandry has not become again a profitable farm enterprise for the Northeast. The answer, I think, is yes, under certain conditions. We have much poor land that could be used for sheep pasture. It has been learned that sheep pasture profitably with cattle. English farmers have followed this custom for generations. Some farmers are finding profit in hothouse lambs. Sheep can be cared for at low building and labor costs.

Measuring these favorable factors against the increasing cost and over-production in many of the other lines of farm business gives some balance in favor of sheep. But there are many ifs.

The sheep is a peculiar animal. To succeed a farmer must understand them and like them, and while the dog problem is not as bad as it once was, a bad dog is still a menace.

Taking everything into consideration, whether to put on a flock of sheep or not is worthy of some thought. If interested, write to the College of Agriculture in your state for a bulletin on the subject, and to the animal husbandry department for the opinion of men who have studied the subject for years. Cornell University has just published an excellent bulletin on sheep, No. E399.

Why Maple Products Don't Sell

MANY hundreds of maple groves in the Northeast farm country go untapped each year because there is not market enough for maple products to make the business pay. What a shame! Our forefathers well knew that maple syrup and honey were the natural sweets and appreciated them, but we of this generation, particularly those who live in cities, have had adulterated maple products put over on us so long that thousands don't even know what first quality maple syrup or sugar is.

There are two or three excellent successful farmers' maple products cooperatives in the Northeast, but they are not large enough nor is there money enough in the business to pay for a campaign of education to teach city consumers the delicious quality of maple products. One thing that maple producers could do is to bring some pressure on state legislatures and on Congress to stop the adulteration of maple syrup and sugar with cane sugar.

Littered Yards

I OFTEN wonder as I ride up and down the country why so many folks keep their house and barnyards so littered with trash. If you don't think this is so, next time you take a ride count the unsightly yards that could be cleaned up in a half day's work or less.

Every city has a spring house-cleaning, when the litter is collected, the yards raked, and the trash disposed of. Let's extend that idea to the country.

Eastman's Chestnut

THE old-time tramp printer was a real and interesting character in the days when newspaper type was all set by hand. He usually was an expert workman, but he couldn't stay in one spot very long, and he frequently was too close a friend of John Barleycorn.

Mrs. F. F. May of Williston, Vermont, sends me a chestnut about a newspaper article that must have been set by one of the old-time tramp printers with a bottle of hard liquor close at hand. He was supposed to put in type a wedding announcement and the notice of an auction sale. This is what was finally printed:

"William Smith and Miss Lucy Anderson are to be disposed of at public auction at my farm one mile east of a beautiful cluster of roses on her breast and two white calves, before a background of farm implements too numerous to mention in the presence of about seventy guests, including two milch cows, six mules and one bob-sled. Rev. Jackson tied the nuptial knot with 200 feet of haywire and the bridal pair left on one good John Deere gang plow for an extended trip with terms to suit purchaser. They will be at home to their friends with one good baby buggy and a few kitchen utensils after date of sale to responsible parties and some fifty chickens."

"YES", Say 92 Per Cent

Milk Producers State Opinions on Nunan-Allen Bill and Federal-State Milk Marketing Agreement

WE PRINTED last time copy of a letter which I wrote to thousands of dairymen in the New York milk shed asking them to express their personal approval or disapproval of the Nunan-Allen bill and the restoration of the marketing agreements in the New York milk shed. Answers are pouring in by the thousands, and if you who took the time to answer my letter could read the replies you would feel repaid for your effort, for these replies are pretty nearly unanimously in favor of the Nunan-Allen Bill and the restoration of the milk marketing agreements to obtain a living price for milk.

There are many who are discouraged, and there are some who are sincerely opposed to the Nunan-Allen bill. To all of those who have answered these letters, my sincere thanks. There are so many that it is physically impossible to give you a personal reply, which I would like to do if I could. You may rest assured that your letter will help first, in obtaining passage of the Bill, and second, to guide the editors of *American Agriculturist* in keeping up a fight for better conditions on the dairy farm.

Here are a few of the letters we received:

* * *

Agreement Raised His Price

When the marketing order went into effect last fall, it raised the price of our milk \$1 per hundred. When the order was declared unconstitutional, it dropped \$1. Unless the milk order is restored, we will be forced to quit dairying. Our last milk check was \$3 more than our feed for the month. Grocery stores in this locality can feel the sudden drop in milk prices.—*T. P., Erie County.*

* * *

Can Work Together

We sell to a small dealer in Endicott. We have to produce about an even flow of milk the year around, and we receive a little better price than the Dairymen's League, etc. With state milk control we received a fair price, but since that time the dealer has been paying just what he thought he had to in order to get the milk. He blames all the troubles of the milk business to the Dairymen's League.

We formerly belonged to the Dairymen's League and withdrew from that organization with friendly feelings toward it; and while we know they have made mistakes, the principle is O. K. The Federal-State Agreement has shown that different groups of dairymen can work together. Let's put it back if possible.—*R. Y., Broome County.*

* * *

Still Need Cooperatives

I find many men talking (and it is not difficult to trace the source of their information) that if we get back the state and federal marketing order, there will be no use for cooperatives. I say we will need our cooperatives more than ever before.

When the price of milk is up, the producers will always have a fight on

their hands, and it has been proven so many times that it is a hopeless fight as individuals. We will need our co-operatives, and they need to be affiliated.—*L. F., Tioga County.*

* * *

Give Order Fair Trial

At how low a price do the farmers have to sell milk before they are willing to forget some of their differences of opinion? Our local newspapers have had one or two columns recently sent by different persons, all saying the farmers should work together, but their way is the only right way and the other fellow is all wrong. Now, I am not in favor of forcing anyone to do something he does not want to do, but when anyone is in the minority, I think he should be willing to fall in line and work for the common good and at least give the majority a fair trial.—*A. C., Oswego County.*

* * *

Do Dealers Like Cooperatives?

I belonged to a cooperative but had to withdraw on April 1 to sell my milk. This is a copy of our milkman's notice to all who sell to him:

"I, the undersigned, agree to ship—gallons of milk daily to....., and I agree not to sign up or join any cooperative association or any other organization connected with the milk business. And if I belong to any at present, I will immediately resign. It is also understood and agreed that there will be a can rental."

To hold my local market, it was necessary for me to sign this—for the present—much against my will. But I still pay into the organization and shall rejoin it as soon as possible. Please keep my name confidential.—*Erie County Producer.*

* * *

Speed Needed

I believe it is the desire of many dairymen to have the Rogers-Allen Bill amended and put into operation as quickly as possible. Many dairymen have stated that they do not know what they will do if the bill is not passed before August or September. Then, too, there are also some dairymen who have stated that if they could get other work, they would gladly leave their farms; and others would accept welfare.—*W. F., Erie County.*

* * *

Opposed — Says Plan Robs Farmer

You are supporting a plan to steal, rob and cheat farmers, the same as you always have. Your group doesn't stop at anything, using the farmer's name in disguise, helping to take even his living away from him, and using what belongs to the farmer to fight him with. There is no such a thing as principle. It is unknown to your kind.

The Dairymen's League is nothing except a dealers' league. You are out howling about chiselers and cheats. You come out and tell farmers that they made more under the order when we made less. We hold our statements to show for it. We farmers ship our milk and then wait six or eight weeks before we know what we are going to get for it, after paying all of the puppets they are out buying up to fight us with. It is a wonder there is any-

The Results to Date

HERE is a partial report on the question, "Do you want the Federal-State Agreement reinstated?" Over 5,000 replies have been received. Answers were:

Yes	92 Per Cent
No	6 Per Cent
Uncertain	2 Per Cent

Answers are still coming in, and it is impossible to give you a complete report in this issue. We will do so later.

On this page you will find a few of the many letters received along with answers to the questions.

thing left for the farmer at all with the kind of a law you are supporting. Suppose you run your business that way. I dare say you wouldn't be at it very long. I dare you to print this in your paper.—*A Producer.*

* * *

The Good Things of Life

I have been farming for myself only three years. We have one small son, and I hope to give him the good things in life so that he will grow into a good, honest man. However, if prices continue downward, I cannot do it on the farm and farming is the work I love. I wish you success in your undertaking and continued success for your grand paper. I feel that our worst enemy is the radical.—*F. T., Washington County.*

* * *

Dog Eat Dog

Our reason for not wanting the federal agreement is that we prefer the milk situation to be a survival of the fittest. We think the price of milk will have to be very low before there will be a better price for milk. As long as the state makes it profitable to produce milk, we think there will be a huge surplus.—*J. R., Tioga County.*

* * *

Made His Wants Known

I was present at Albany on April 12 in support of the Nunan-Allen Bill. I have personally contacted all of Erie County's Assemblymen as well as Senator Arthur Swartz. All seemed favorably impressed.—*F. O., Erie County.*

* * *

Oppose's Government Control

The boys at Albany can spend their efforts to repeal all useless laws and departments rather than to hatch new laws and offices.

I am not versed well enough and the subject is so deep, I have nothing constructive to offer. We must face the fact that we have nation-wide and even world-wide competition in milk, particularly through milk products. I do not favor any type of state or federal control. It was tried and failed—worth the trial, but let's appreciate the lesson and not go into another control program. When times improve, any type of control works swell. In bad times, no control works. We dairymen will just have to face the problem by

living within our income and producing as economically as possible. Some dairymen will be driven out of the business in New York State and also in Wisconsin. We cannot have state tariff laws. Looks like tough going for a while, but I have faith that a good dairyman with stick-to-it-ism will make a good living as a long pull.

—*H. M., Saratoga County.*

* * *

Order is Only Hope

After attending the meetings I have this winter and listening to you talk to us dairymen and also following your splendid articles in your paper, I am sure I can address you as a friend. I commend you on the way you have gotten behind the dairymen to help us get a living price for our milk. I will say that I am not in sympathy with state or federal control of milk, or for that matter any other farm commodity, but as matters stand now, I think the Nunan-Allen Law and the restoration of the federal order is the only hope we have at the present time.

After attending the Albany meeting and listening to some of the opposition's hot air, I became more convinced than ever that we have a real enemy—I might add a cowardly enemy—to fight; but am sure that if we will but stand solidly together—and I am sure you will stay with us—we have a fighting chance to win.—*R. P., Yates County.*

* * *

More Employment Would Help

The present dismal dairy outlook goes deeper than just a surplus of milk. The attitude of the present Administration at Washington toward business causes too much unemployment with a lower purchasing power of the consumer. The unfair and unjust demands of radical labor leaders cause too high prices of manufactured goods.

The Administration's policy of crop control is unfair. The cotton grower of the South has lost his market and has turned to growing other crops which force northern products out of the markets. Northern growers have turned to producing milk which adds to the surplus.—*H. B., Genesee County.*

* * *

Inactive Member

I joined the Dairy Farmers' Union about two years ago. This section signed about 60 per cent. Most all of the farmers are opposed to it now. If a count of active members were taken here, and this locality is a sample, a 98 per cent cut would be about the figure.—*C. W., Madison County.*

* * *

Guernsey Men Speak

Being a Guernsey breeder and shipping Golden Guernsey milk, I am strongly opposed to the Nunan-Allen Bill as it is. However, if that equalization clause is removed, then I and practically all of my fellow shippers will support it. We much prefer the Seelye-Sherman Bill. We of the New York State Guernsey Breeders Cooperative take care of our own surplus and all our milk is sold as fluid milk, contracted for ten years in advance; so do you blame us for fighting against this bill which cost us \$14,500 during

(Continued on Page 10)

"I shudder to think how near we came to burning in that barn last night!"

"Lucky for us there are telephones—otherwise we'd be roast beef today!"

LUCKY FOR YOU and lucky for your boss that there was a telephone in the house to get help in a hurry. It would have been a blow to lose you, not to mention that good, new barn.

Day after day the telephone carries on its normal duties of serving a busy family. No matter what the nature of the call—something to do with running the farm, a chat with a neighbor, or a great emergency—the telephone is always on the job.

Avoid Unadapted HYBRID CORN

RESULTS from the use of adapted hybrid corn—both field and sweet corn—have been so satisfactory that unusual interest has been aroused. Prof. R. G. Wiggans of Cornell points to a danger that should be avoided. Says he:

"Hybrids adapted to one region and set of conditions are not necessarily adapted to another region with a widely different environmental set-up. Hybrids cannot be expected, either theoretically or practically, to have a wider adaptation than commercial varieties. No hard-headed farmer in New York State would look to the Corn Belt for a variety of corn for his own use in preference to a well-known adapted variety with which he was familiar. The most he would risk would be a small planting along side a known variety."

Farmers are being offered seed corn from a number of Corn Belt hybrids which cannot be recommended for the Northeast because no adequate tests have been made. Hybrids proving good in one region will not necessarily give satisfactory results in another. Almost all Corn Belt hybrids mature too late for northeastern conditions. For example, last year 15 hybrids of corn from out of the state were compared to Cornell 29-3 and averaged to produce 2105 lbs. less dry matter and 375 lbs. less dry grain per acre than 29-3. This latter variety is especially recommended for silage at elevations of 600 to 1500 ft. and for grain in the more favorable corn growing areas in New York State. It has given good results in northern New England, but other varieties have given better results in Connecticut.

Farmers Demand Better Protection in Wagner Labor Law

(Continued from Page 3)

the women are now on relief.

Another case in another county has come to my attention. The Silver Creek Canning Company contracted for 200 acres of beets to can. The contract read: "in case of strikes, etc., we are not liable." The farmers raised the beets and in the fall when they were ready to can the C.I.O. came into the canning factory and demanded increases of pay and recognition of the Union. This canner had already contracted to sell his beets and the price had been set for the canned goods. What could he do? The canner refused the beets and the farmers in that town lost about \$5,000 of potential income.

Peas, beans, tomatoes and some of our fruit are very perishable and have

to be handled with a great deal of speed. Weather waits for no man. Take peas, for example, a twenty-four hour delay in harvesting and canning will change the grade from choice to standard, and a seventy-two hour delay makes the crop worthless.

The irresponsible Unions strike at a time when we farmers are at their mercy. Farming is a family business. We are all laborers, our profits are meager and we cannot stand added pressure from union labor. All added cost of marketing is settled back on the producer. Mr. Wallace will tell you that the average income of our farms is pretty small, and if we are saddled with more cost in our processing plants, what is the answer? More subsidizing from the government?

Statement of Mr. T. A. Buhl at Congressional Hearing to ask for amendments of the Labor Relations Act better to protect agriculture.

IT IS FUTILE to think that agriculture, at least in western New York, can stand added charges to its costs of production. The point has been reached where additional costs, however slight, will mean universal insolvency.

My office is in Batavia, the county seat of Genesee County. Ten miles away is a village of perhaps three hundred people, among whom is a young veterinary. He has been practicing at that particular location for three years and in that time has accumulated \$5,000.00 on his books. He has just decided that he cannot stay but will come to Batavia and start over again with a small animal hospital. The people in his present location like him and are sorry to see him go, but they simply cannot pay him his fees.

I feel sure that farmers are not hostile to labor. They are faced, however, with the struggle to exist and under such conditions you cannot expect them complacently to sit by and see organized labor invade agricultural processing plants and threaten to organize the farm labor field next.

If a mill shuts down shoes do not deteriorate, but are finished when the strike is settled. When the canning factory peas are ready to cut a few hours delay may change them from number ones at \$120.00 a ton to number sixes at \$10.00 a ton, and a day or two may make them worthless. It must be obvious that a strike on a dairy or poultry farm would be disastrous. Of all types of activity, agriculture is most quickly and completely affected by labor trouble, as its nature makes it completely vulnerable to this type of persuasion.

ADDING HUMUS.—Plowing under rye for potatoes on the farm of Gardner Brothers of Tully, N. Y. These brothers, Walter and William, grow 75 acres of certified seed, including 30 acres of Chippewas and 25 of Katahdin. The two men on the tractors are Lynden and Lloyd Aldrich. "Years ago," said Walter Gardner, "we had a great deal of trouble with scab. For some years we have been adding 300 mesh flour of sulphur. It takes about 700 lbs. to the acre to change the PH to a point where scab does not bother us." Mr. Gardner is an officer of the N. Y. State Cooperative Seed Potato Association.

New PURI-FLAVE

Vitamin G (Flavin) Ingredient Now Added to Startena and Growena for Increased Growth!

TODAY there are new improved feeds in the old familiar Checkerboard Bags. Purina Startena and Purina Growena now contain Puri-Flave, a new exclusive growth ingredient.

Puri-Flave is a concentrate of vitamin G (flavin), a factor which is absolutely essential to the growth of chicks and pullets. Puri-Flave is added to Startena and Growena to make sure that an abundant supply of this important growth material is included in the feed.

Puri-Flave is 2½ times richer in flavin than dried buttermilk. It is four times richer in flavin than dehydrated alfalfa leaf meal. These are the ingredients that up to now have been considered some of the best sources of flavin.

When you feed the new Startena and Growena containing Puri-Flave, you give your birds tried and proven feeds. See your Purina dealer today . . . make sure your chicks get every chance to live and grow . . . *feed them the Purina Way!*

PURINA MILLS
Buffalo, N. Y.
St. Johnsbury, Vt.

Modern testing equipment like this made possible the development of Puri-Flave. Feed ingredients are tested for vitamin A and vitamin G (flavin) content with this equipment in the Purina Laboratory before they are accepted for use in Purina Chows.

WHAT DO I REALLY WANT?

I WANT PERSONAL CHARM!

THE things people WANT indicate very definitely where they are headed. I met recently a lovely young girl who thinks she wants beauty, culture, and refinement. But by her actions she chooses cheapness and tawdriness. Her beauty will soon fade unless she chooses to do the things that build beauty rather than destroy it.

In contrast I know an older lady who lives in the very atmosphere of beauty. Each year her influence spreads to wider fields. She wants to make the world a better place to live in, and she does. I knew her as a girl, and each year she grows more and more beautiful because beauty comes from within. She wanted beauty and she found it.

■ ■ ■

Do You Want Friends?

THEN give yourself to your friends. Friendship is often made up of little things that mean so much to others and cost so little from us. A smile, a friendly call, a helping hand, a letter, the remembrance of an anniversary — these simple things are often the ingredients of lasting friendship.

Do You Want Personality?

You may not have been born with "It" or "Umph", but you can develop a radiance within that will make your life a joy to others. Give your personality a chance. Cut out your inhibitions. Start today.

Which Do You Want?

PERSONAL CHARM
(These build up Personality)

Develop a Smiling Countenance
Neat personal appearance
Cultivate a sense of humor
Consider the other fellow
Assume community responsibility
Make new friends

SMILE TALL

or

COMMONPLACENESS

(These tear down Personality)

Corners of mouth turned down
Carelessness
Mr. Grouch
The Devil take the hindmost
"Let George do it"
Not interested

Put this \$100⁰⁰ in your pocket

HERE'S A WAY to save which most good farmers already know and many practice.

Use the right kind of lubricant in the right place on every piece of farm machinery.

The old days have gone when a bucket of axle grease and a squirt can of oil were the only lubricants needed. Today's machinery is more complicated, with tighter-fitting bearings and requires specialized lubricants for efficient operation and longer life.

"What could the average dairy farmer add to the value of all his machinery by constant and proper lubrication through its life time?" We asked a farm economist this question. His answer was, "It would vary a whole lot, of course, but I think \$100 would be a fair figure."

"What would it cost him extra for the right oils and greases?" we asked.

"Nothing extra. He might even save money. More often than not the wrong kind of lubricant not only increases friction, costing him power and hastening wear, but won't stay put and wastes itself," the expert told us.

Shell engineers have made thorough studies of farm lubrication problems. Talk to your nearest Shell man about them. You'll be surprised how economical Shell products are and how well they work in your machinery.

Cutting Seed Potatoes

THE MACHINE illustrated above speeds up the job of cutting seed potatoes. The operator decides how many seed pieces each tuber will make, and then places it in the proper hollow. When the knife drops, it cuts the tuber into 2, 3 or 4 seed pieces.

This machine, run by a small electric motor, is in use on the farm of Maurice Mallory of Broome County, N. Y.

It is generally agreed that seed pieces should be blocky and weigh at least 2 ounces.

Seed potatoes are commonly treated before they are cut. One of the newer methods is to dip them into a mixture of one pound of yellow oxide of mercury and fifteen gallons of water. The yellow oxide of mercury does not dissolve and needs to be stirred to be kept in suspension. The mixture does not lose strength and can be used as long as any is left. However, it is advised that potatoes so treated be planted the same day or at least within a few days, as there is some evidence that treatment retards vine growth if treated tubers are allowed to stand too long.

The usual method is to provide wire baskets and dip them into a tub about the same size. The basket is plunged up and down two or three times, and then set on a drainboard so that the solution can drain back into the tub. Wire baskets—in fact, any metal containers—are painted with asphaltum paint, as the material tends to react with metals.

Another method of treatment which is gaining favor is Semesan Bel, a commercial product used according to manufacturer's directions.

Green Sprouting POTATOES

WHILE green sprouting of seed potatoes seems to have no effect on the stand, it does increase the number of tubers per stem and results in an appreciable increase in yield. Green sprouting beyond two weeks period did not result in sufficient increase in yield to justify the extra time.

At the same time that the experiments with green sprouting were conducted at Cornell, results were obtained on effect of depth of planting. During four years, planting at a depth of four inches gave the highest average yield of No. 1 potatoes, although planting at two inches gave a larger number of stems per plant, resulting in a recommendation to plant potatoes at a depth of from two to four inches.

A Sulfur Fungicide of TRUE Microscopic Fineness! MICRO-SPRAY⁺ SULFUR

Orchard Brand Micro-Spray Sulfur has proven more effective than ordinary wettable sulfurs, because its finer particles expose a much greater sulfur surface. This means that more sulfur vapors are freed in a given period. The finer particles also mean that filming and sticking are improved.

Orchard Brand Micro-Spray Sulfur, used in the pre-bloom sprays, effectively prevents early scab infection. In the cover applications it protects against late scab, without interfering with foliage development or finish or color of fruit, a hazard always associated with the use of lime sulfur.

Micro-Spray Sulfur has set a new standard in some of America's largest and best orchards.

Garden Gossip

By PAUL WORK

SINCE preparing copy for the April 15 issue, I attended a conference of the Northeastern Vegetable and Potato Growers Council. At a previous meeting, this group had gone over pretty thoroughly the packaging requirements for northeastern vegetables

Paul Work

with an eye to some desirable changes and a good deal of standardization. At the more recent meeting, Mr. Donald C. Manchester, President of the Connecticut Vegetable Growers Association, who is Chairman of the Council's Packaging Committee, brought in a sample crate for Iceberg lettuce, which, it is hoped, would also prove

well adapted for bunch vegetables and for other items as well. The inside dimensions are 22" x 13" x 11". The 22" by 13" is the same as the corresponding dimensions of the Los Angeles lettuce crate. The 11" is 2 inches larger than the half vegetable crate which is rather extensively used for bunch vegetables from Texas including broccoli.

This suggested container would be a good starting point for discussion among the lettuce people of this state.

Now that we have a head lettuce that performs much better than any we have ever had before, we have entered upon the critical period in the enterprise. The job can be ruined pretty easily if marketing is not as well done as plant breeding has been.

Variety in the Garden

One weak point about a good many vegetable gardens is the lack of adequate variety. Many vegetables that are common and easily grown are likely to be neglected. Among the roots for fall harvest, parsnips, salsify and rutabagas may well be included. Then, if you want something really distinct, plant some celeriac or root celery. This is very much like the little meaty hearts at the base of our ordinary celery plant but much larger;—say as large as a potato. Yes, potatoes are of many different sizes; so are the roots of celeriac.

Cauliflower is often left out of gardens because it is a bit uncertain. If plants are set out fairly late for maturity in the last half of September and October, results are much safer in most parts of the state than when we try for mid-summer maturity. In the cooler sections, it may be matured in August and in some places also, from first early plantings, to head out in July.

Another tasty vegetable that is not so common is kohlrabi, the member of the cabbage family that makes "turnips" on the stem above ground. It wants to grow rapidly and should be harvested before it gets old. They are likely to be stringy and tough then.

There ought to be a little row of parsley for garnishing and flavoring throughout the season.

Summer squash comes early, is easy to grow and is certainly delicate when it comes along in July.

Okra will mature all right in our climate. One who has never had it ought to try it to see what it looks

like. The flowers of this plant, which belongs to the cotton family, are like hollyhocks and very pretty. The pods should be taken young—otherwise they, like kohlrabi, become tough and stringy. Almost any cook book will tell how to make chicken gumbo soup. Of course, if you do not like things that are a bit slippery, you had better let it alone.

Almost anybody can have spinach

in spring and fall. Swiss chard and New Zealand spinach are the proper items to plant for summer greens. Good King Henry was always a favorite with Bob Adams for first early. This plant is perennial and should be planted at the side of the garden with the asparagus and rhubarb. It is one of the first things that starts to grow in the spring.

Garden Values

The apostles of the home garden frequently make remarks extolling its high value as a part of the farm enterprise. At various times, surveys have been made to set forth the facts. Michigan Quarterly Bulletin for February, 1939, contains an article by Ashley and Burke giving results for 255 farms in different parts of the state. The average value in 1937 of home

grown farm produce was \$306 per farm. The cows contributed most heavily. Then came the vegetables including potatoes. Canned products which doubtlessly included many vegetables follow right along.

It is interesting to note that the prices used are based on farm value and not upon what would have to be paid for goods at retail. As the bulletin suggests, this would at least double the values and would bring vegetables from around \$33 to around \$65. This is very modest at that, for most commercial vegetable growers would be tickled to death to receive half the retail price. In general, the actual figure is nearer a third.

It may be worth while just to check up and see how many other half acres on the farm will turn out \$65 worth of actual living.

FOR HARD FARM USE

there's nothing like a FORD V-8

ONLY V-8 ENGINE

in any low-priced car; smoother, more responsive, more fun to drive.

HIGH GAS MILEAGE

85 h.p. Ford V-8 in this year's Gilmore-Yosemite Economy Run showed best gasoline mileage among all leading low-priced cars.

MORE THAN ONE-THIRD OF THE MILKING MACHINES USED BY MEMBERS OF DAIRY HERD IMPROVEMENT ASSOCIATIONS IN THE U. S. A. . . . ARE DE LAVALS

TRY A DE LAVAL

In order to satisfy yourself that a De Laval will milk your cows better, save you more time, make you more profit and give you greater pleasure and satisfaction, try one. Your De Laval Dealer will gladly arrange a free trial demonstration.

There is a De Laval Milker for every need and purse, and they are sold on such easy terms that they will earn their own monthly payments.

A RECENT investigation among the many thousands of members of Dairy Herd Improvement Associations of the U. S., reveals that more than one-third, or to be exact 37.1%, of all the milking machines used by them are De Lavals.

Such preference and use of De Laval Milkers by this progressive group of dairymen, many of whom have made outstanding production records with De Laval milking, is the strongest possible endorsement of their economy and efficiency.

The more exacting the requirements the more De Laval Milkers you will find in use. For example, 60% of all Certified Milk produced in the U. S. A. comes from De Laval milked herds. There are also more De Laval Milkers used the world over than any other make.

There must be a reason for such general use and approval of De Laval Milkers. The answer is simple: they have proven in actual use that they give the best results; that they milk faster, better and cleaner; give longer and more dependable service, and are easier to operate. See your De Laval Dealer.

THE DE LAVAL SEPARATOR COMPANY
New York Chicago San Francisco
165 Broadway 427 Randolph St. 61 Beale St.

De Laval World's Standard Series, 4 sizes: hand or electric drives.

More Than HALF of the CREAM SEPARATORS Used by D.H.I. Members Are DE LAVALS

Members of Dairy Herd Improvement Associations have the skim-milk from their separators tested at frequent intervals by cow testers, so that they know De Lavals skim cleanest and give longest and best service. That is why more than 57% of them use De Lavals.

De Laval Separators are the best and in the long run the cheapest of all cream separators . . . sizes, styles, prices and terms for every need and purse. Sold on such easy terms that they earn their own monthly payments.

De Laval Junior Series—Best low priced separator. 5 sizes.

the few months it was in operation? Also our equipment and sanitary requirements are much above the average. Our bacteria must be under 10,000, and everything else in comparison. Are we right or wrong in wanting either separate equalization or no equalization?—**J. W., Greene County.**

Wants Honest Dollar

I believe that dairymen, as well as others, should eventually handle their marketing and allied problems without direct governmental assistance other than permissive legislation and usual policing functions work. Given an honest currency and a price stabilizing marketing organization, dairymen should expect to have to accept a price for milk that reflects the extent to which supply may exceed consumption. Too many props under the milk stand merely induce more people to use it so that when it falls, it simply crashes that much harder.—**G. G., Monroe County.**

Calling Names No Help

In June, 1937, I joined the Dairy Farmers' Union with very little hope and no faith in the plan's doing any good unless by its influence as an organization to get legislation favorable to dairy farmers. I have attended some of their meetings, and about all that was done was to try to discredit everything but the Union and to call the Bargaining Agency and everyone connected with it crooks and liars.

At a recent meeting one of the leaders said the Union had 14,000 members and only 4,000 had paid their dues. I am one that has not paid and won't as I invalidated my order after one payment. There are a lot of dead or inactive members like myself in this locality.—**J. L., Madison County.**

Will Support Any Sound Program

Production of milk is the main part of farming in our locality. Producing milk means nothing to farmers unless it can be sold at a fair price. It is certainly too bad when a few milk dealers, a few politicians, and a few milk producers can beat down the price way below cost of production to all milk producers in the New York milk shed.

First—I am for the Federal Marketing Agreement (if restored by the Supreme Court) and the passage of the Nunan-Allen Bill.

Second—On failure of the above, I will support any sound program to secure better prices.

Third—If the above two plans fail, I would not object to dairy farmers taking more radical steps to increase prices, although I hope this will not be necessary.—**R. P., Cattaraugus County.**

Go to It!

I am greatly pleased with your stand to help us northeastern farmers. If there ever was a time when the small-fry of us hill-billies needed concerted action, it is NOW.

So many like myself have shouldered our troubles and kept digging dirt while people like the C.I.O. have done everything that seemed possible for devilish human minds to conceive to oppress the small farmer, especially those who have had no wind-fall to give them a backing but have had to sharpen several pencils and then ran in the red.

There are agitators within a few miles of my home, as I presume there are in every community. This really makes one disgusted with the ideas from dealers who are opposed to anything that would benefit the farmer.

Get behind it, push it, drive it! Put out propaganda to match them. The newspapers I have read are good, but

make it stronger and appealing to every housewife that uses milk. Here's my hand and heart. Go to it!—**G. D., Cortland County.**

Chiselers Make Trouble

I am a born Dairymen's Leaguer and a young farmer delivering over 1800 lbs. per day of milk to the dry milk plant at Bainbridge, N. Y., which is a branch of Borden's. I believe some of the large milk companies are receiving unjust criticism. I think our troubles are mostly the fault of the chiselers who did not live up to the rules of the marketing agreement.

I have nothing to say against other

Did Not Oppose Nunan-Allen Bill

The issue of *American Agriculturist* of April 29 just reached me. I was greatly surprised when I read about farmers urging passage of the Nunan-Allen Bill at Albany on April 12, 1939, to find my name listed as one of those who was opposed to the passage of the Nunan-Allen amendment to the Rogers-Allen Law.

While I was one of the last speakers for the proponents' side at the hearing, if your reporter who covered that hearing at Albany will check up on his memory, he will recall that I came out strongly in opposition to Mr. Meyer Parodneck of New York City when he made a statement that the dairymen were getting well paid by some organization because the dairymen were at the hearing in such large numbers. I said that no organization need pay us farmers to come to Albany to fight for our rights.

I wish you would correct that error in your next issue. I don't feel like associating myself with the anti-farm gang or Consumers League. They are not out working to help the dairymen. If we farmers want to read farm publications, and we should read them, then let us patronize the *American Agriculturist*, the one farm paper who has fearlessly fought our battles for many years.—**PATRICK J. LALLY, Millbrook, Dutchess County, N. Y.**

organizations except the Farmer's Union, which I believe is all wrong and is supported by the anti-farm gang and misleading many dairymen. I wish to thank *American Agriculturist*.—**L. G., Chenango County.**

Must Get Together

We have to agree on something to bring all of the different organizations to one head to get a living price for milk, and it seems to me that the Nunan-Allen Bill is the only way in sight to do that. What each individual farmer thinks is not going to get us
(Continued on Page 18)

"How about fixin' up some false teeth for this, Doc?"

CHARLES M. GARDNER

Editor of the National Grange
Monthly and High Priest of De-
meter of the National Grange.

A SERIES of regional conferences for Juvenile Grange workers has just been completed in New York under the direction of the state superintendent, Mrs. David Kidd of Dansville, and the attendance figures show how deep-seated is Juvenile Grange interest in the Empire State. At 11 conferences covering 16 counties and 120 active Juvenile units, 80 of the latter were represented, by 61 matrons, 15 assistant matrons and 40 members of Juvenile committees. Thirteen subordinates not having a Juvenile branch were represented by 23 members of Juvenile committees, while of the 16 Juvenile county deputies, 14 were in attendance. Erie County was represented 100%, and Cattaraugus, Chautauqua and Niagara nearly so. Other conferences will cover different sections of the state and at the present time no other section of the Grange field is showing higher Juvenile interest than New York.

MAINE Grange work has lost one of its most enthusiastic leaders in the death of Irving W. Case of Lubec, former Steward of the State Grange. He was very prominent in his section, had

served several terms as representative and state senator, and had been master of Washington County Pomona longer than any other Patron.

MASSACHUSETTS Grange work shows the lively character of its lecturers, and in few states is this corps of workers more energetic or original than those of the Bay State. This year six lecturers of subordinate Granges hold the same position in Pomona Granges, and thus carry a double responsibility; out of 300 Granges, 209 lecturers are new this year and eight of last year's lecturers have become masters for 1939. One-half the Pomona lecturers are new this year and six of these are men, one being Deputy John E. Johnson of Middlesex-North Pomona, No. 16. The subordinate lecturers of the state also include Deputy Clarence E. Anderson of East Bridgewater, and in the 300 Massachusetts subordinate Granges, 57 of the 1939 lecturers are men.

TRUMBULL GRANGE, No. 134, in Connecticut, claims a distinction that will be hard to duplicate in Grange circles throughout the country. It possesses in its membership this year four Grange masters—Edgar L. Tucker, Master of the Connecticut State Grange; David M. Wakeley, master Fairfield County Pomona; Andrew Kachele, master Trumbull Grange; and Robert Jennings, master of Trumbull Juvenile.

COLUMBIA COUNTY, New York, Grange members are looking forward to Sunday evening, June 11, when a big county-wide Church-Grange service will

(Continued on Page 18)

By J. F. (DOC) ROBERTS

HAVE just returned from a trip through our so-called "North country." Spring there, while late, is about as far advanced as our more southern sections; most unusual, but probably due to our cloudy days and their sunshine.

The thought uppermost in everyone's mind is not how they can get out of the dairy business, but how they can stay in, realizing that less milk is the only real answer to that question. Income must be maintained or improved; increased and more efficient pasture utilization must be practiced, and the feed these extra dairy cows are now consuming must be taken care of profitably. I still maintain that the farmer is completely capable of taking care of himself, and what I found proves it.

I attended a meeting in St. Lawrence County, New York, the section directly north of Watertown, in which over 500 men had gathered together in two days to talk livestock diversification as it applied to their particular section. These people are well on their way with such a program, having started to breed their mares about three or four years ago, after importing some fine work-horse studs, and already have practically stopped importation of western horses. Just the fact that they came out to a livestock meeting in such numbers will tell you how interested they are and how successful this type of operation is proving. They are moving about 1000 of these home-grown native colts this year, and are still below normal western horse importation. These native colts are meeting a better demand and giving greater satisfaction than Western horses and are selling from \$30 to \$50 a head more—weight, age and kind considered. Isn't it fair to assume that they will continue to be successful with this operation as a sideline to their

dairy business, and that it will also improve their milk situation? For this fine piece of work, while done by the farmers themselves, credit still should be given to Mort Adams, Russel Cary and Joe King for the work that they have done as County Agents around St. Lawrence County.

I attended a meeting at Walpoole, New Hampshire, with Cy Terrel, head of the Animal Husbandry Department, New Hampshire State College of Agriculture, and again found men not only talking, but in actual operation, cutting down their dairy herds and diversifying with sheep. These men were using principally the high mountain pastures and seemed to be using Cheviot crosses to advantage, maintaining weight, having their lambs come just before grass and marketing them in the fall off pasture, off ewes, practically no grain, and marketing lambs weighing better than 70 lbs. in this way. The interesting thing in this operation is that their type of cross will scatter all over a large pasture. Our men in this section of the Northeast want their ewes to band, but of course that would not do in their type of pasture grazing, so again it is very definitely brought out that there are all types of sheep for all types of farms and conditions.

I attended another type of meeting at Windsor, Vermont, with the Morgan Horse Breeders and the Horse Show Association. With their wonderful dirt road trails and their series of weekly horse shows, they have become very much saddle-horse minded, and I seldom have attended a meeting that showed the enthusiasm for the horse and horse breeding that I saw there.

Wool—To sell or not to sell, that is the question. Uneven prices bid and asked, particularly in the country, do not express the actual situation. Wool is actually selling about 2c a lb. higher than a year ago on the Boston market. There is not as much wool on hand as there was a year ago. Mill consumption is very much heavier than last year, and therefore I can only suggest that unless you can get at least 2c a lb. more for your wool than you did last year, you should hold it, anticipating a better market and a better situation soon.

NORTHEASTERN *Slants* ON THE *National* NEWS

■ Supreme Court Upholds AAA

IN 1933 CONGRESS, under New Deal leadership, passed the Agricultural Adjustment Act (AAA) in an effort to help solve the farm problem. Processing taxes levied on processors of farm products were to be used by government to pay farmers who reduced their production either by growing smaller acreages or by actually plowing under crops or killing young pigs.

In January, 1936, United States Supreme Court declared Agricultural Adjustment Act of 1933 unconstitutional. Another AAA law was later passed, but without processing taxes. The subsidies which were paid to farmers under new Act for controlling production came directly from United States Treasury.

Two weeks ago United States Supreme Court declared new AAA constitutional, and reconciled its second decision with its first by claiming that first AAA of 1933 was unconstitutional because it sought direct production control on farming, which was local business not subject to United States law. But second AAA was constitutional because its controls all have to do with marketing, which is Federal business on an interstate basis.

Justices Butler and McReynolds voted in negative, claiming that new AAA was no more valid or right than the old, because whatever may be its declared policy or appearance, the law operates to control quantity raised by each farmer.

The second decision was so broad that it is held as upholding Administration's entire farm program for control for marketing of tobacco, cotton, corn, wheat, rice and other crops.

■ Hit Milk Price Fixing

"FARMER associations and government officials, rather than milk distributors, are principally responsible for high milk prices," said Thomas H. McInnerney, President of National Dairy Products Corporation, to Federal Monopoly Committee at Washington on May 1.

"For the last several years," said Mr. McInnerney, "dairy farmers cooperative associations and government bodies through orders and licenses have maintained Class I prices of milk at levels much higher than the basic value of milk used for manufacturing purposes as determined by supply and demand conditions in competitive markets."

"When government bodies commenced regulating Class I farm prices, they acceded to farm demands and raised Class I prices still higher in a vain attempt to increase the blended or net farm price."

On May 2, Theodore Montague, President of the Borden Company (not Borden Farm Products), testifying before temporary National Economic Committee, urged elimination of abuses by organized labor and organized milk producers as a solution to the problems in the industry. He characterized government milk control as a failure, the principal reason being the incentive to "bootleg" milk as a result of fixing prices at too high a level. He denied that there was any monopoly in the distribution end of the milk industry.

SLANT: At a time when farmers are receiving starvation prices for milk it is certainly interesting to hear from

milk distributors that milk prices are too high. For 25 years distributors in the northeastern milk sheds have been fighting with organized dairymen to base milk prices on price of butter and other by-products. If organized dairymen had agreed to this plan it would have cost them many millions of dollars in lower prices during past years.

■ Congress Investigates WPA

HUGE SUM of \$2,350,000,000 has been appropriated by Congress for Works Progress Administration (WPA) in current fiscal year that ends July 1. Even this sum, which is beyond power of imagination to grasp, is \$50,000,000 less than President Roosevelt requested, and far less than was demanded by Workers Alliance, a Union of unemployed whose chief purpose is to agitate for more relief jobs and higher relief pay.

When House of Representatives Appropriation Committee was asked for another huge appropriation for WPA for coming year, it started investigation of WPA Workers Alliance. David Lasser, President of Alliance, told committee that he was an ex-socialist. Herbert Benjamin, secretary-treasurer, admitted that he belonged to communist party, and said two other members of Alliance's executive committee were communists. Colonel Harrington, who followed Harry L. Hopkins as head of WPA, defended Workers Alliance, and said it had right to speak for its membership in conference with WPA officials. People on relief or in WPA who belong to this union have to pay from 10 cents to \$1 per month dues.

SLANT: Of all absurd and dangerous situations, this one takes the prize. Government and the taxpayers furnish work, mostly unprofitable, to unemployed, who in turn pay part of their wages for union dues led by communists, whose purpose it is to force government and taxpayers to pay higher wages. Can you beat that!

■ Why Move Farm Credit?

"TO CONTROL expenditures, to increase efficiency, to eliminate overlapping and duplication of effort, and to be able to get the information which will permit him better to advise Congress concerning the state of the Union and the program of the government —!" This is the stated purpose of the President's proposed reorganization of government agencies.

Three new agencies are created—the Federal Security Agency, the Federal Works Agency, and the Federal Loan Agency—each with an administrator and assistant administrator to be named by President.

Under the Federal Works Agency will be grouped the Public Roads Administration, now in Department of Agriculture; the U. S. Housing Authority, now in Interior Department; the Public Works Administration, now independent; the Works Projects Administration, now independent; and the Public Buildings Administration, now divided between Treasury Department and Interior Department.

Under the new Federal Security Administration will be grouped the Civil Conservation Corps, now independent; the Office of Education, now in Department of Interior; the Public Health

Service, now in Treasury Department; the National Youth Administration, now in W.P.A.; and the Social Security Board, now divided, part being independent and part in Department of Labor.

Under the new Federal Loan Agency will be grouped five agencies now independent, namely, the Reconstruction Finance Corp., the Electric Home and Farm Authority, the Federal Housing Administration, the Export-Import Bank of Washington, and the Federal Home Loan Bank Board.

Reorganization Law recently passed does not require approval of administrators by Senate. Some Congressmen feel that confirmation is necessary on basis of law requiring confirmation of all federal appointees who receive salaries in higher brackets.

Of particular interest to our readers is transfer to Department of Agriculture of two independent agencies—the Farm Credit Administration and Commodity Credit Corp., as well as the Federal Farm Mortgage Corp., now under the Farm Credit Administration.

SLANT: Farmers and their organizations are emphatically opposed to the transfer of Farm Credit Administration to Department of Agriculture. Of all government agencies in Washington trying to serve agriculture, Farm Credit Administration has been least criticized, and has done a fine job. Why, then, these farmers and their leaders argue, not let well enough alone? Why bury or mix an independent agency like Farm Credit, which has been doing such good work, into complex activities of Department of Agriculture, which already contains so many different bureaus and jobs that it is difficult to administer them all efficiently?

If change is to be made, farmers are going to watch carefully to insist that Farm Credit work be kept on its present efficient basis and permitted to carry on with its present high-class personnel and with the independence to operate it has had in the past.

Farm organization leaders are also opposed to efforts to transfer the Forest Service from Department of Agriculture to the Department of Interior.

Congressional troubles will be increased through necessity of rewriting much legislation affecting agencies involved. Congress must act within 60 days or reorganization plans automatically become operative.

Congressional approval of reorganization is predicted. Under law both Houses must approve or disapprove—cannot amend. President emphasizes estimated saving of \$15,000,000 to \$20,000,000 a year, but stresses efficiency by better coordination and centralization of authority.

■ Suggests Tax Revision

BROOKINGS Institute, independent research agency, publishes report on taxation. Report states that between 1923 and 1938 total taxes in proportion to national income nearly doubled. In 1913 taxes took 7% of national income; in the twenties from 10 to 12 per cent; in 1938 23 per cent.

Along with other recommendations, report suggests changes in corporation income tax particularly to relieve small corporations and the elimination of capital stock and excess profits taxes. Report admits that program recommended might bring less tax revenue but says:

"The gains resulting from the stimulus to the expansion of private enterprise would, in the near future, much more than offset any probable revenue losses."

Two theories of taxation are crystallizing; one, the older idea, assumes levying of taxes to provide income for necessary government activities. The

other, newer idea, backed by many in Washington, considers taxation as means of regulation and control to bring about redistribution of wealth, hampering of certain types of business, and encouragement of others.

SLANT: Everyday citizen is interested primarily in fewer taxes, and more business so that relief expenditures may be cut drastically.

No Room for Wreckers

CASE of Joseph Strecker of Arkansas has just been decided by United States Supreme Court, permitting Strecker to remain in America.

Strecker was prosecuted by United States Labor Department on ground that he was a communist and an alien, and therefore under the law he should be deported. Supreme Court decided that Strecker was not a communist member at time he was arrested for deportation, therefore he did not come under law for deporting alien communists.

Labor Department is now proceeding against alien Harry Bridges, native of Australia, who is a radical C.I.O. leader in maritime labor troubles on our West Coast. Labor Department claims Bridges is both an alien and a communist, and therefore should be deported.

SLANT: Hope the Department is right. There is no room in America for aliens who would overthrow principles upon which our democracy is founded.

Food Stamp Plan Starts

MAY 15 is date set for beginning of Federal Surplus Commodities Corporation's food stamp plan in Rochester (see page 10 of April 29 issue for full explanation). Experiment will continue for three months. Offices are being established in Federal Building, Rochester, for sale of stamps to eligible persons. Orange stamps range from \$2 to \$10 in value, blue stamps from \$1 to \$5.

Stamps will be presented to banks by grocers only on a special card. They are only ones who will accept stamps in trade. Experiment is designed to replace distribution of surplus food products to needy families through regular relief agencies.

Hitler Replies

MOST IMPORTANT features of Hitler's reply (April 28) to Roosevelt's plea for peace were tearing up of Germany's treaty of friendship with Poland, negotiated in January, 1934, and which has five more years to run; and his denunciation of naval treaty with Britain. Reason given for terminating German-Poland pact was that Poland had violated pact by allying herself with Great Britain. Intimation is that Poland is now in situation comparable to Czecho-Slovakia before German domination.

Hitler demands Danzig and a passageway across Polish corridor between Prussia and East Prussia. Britain and France have promised to aid Poland should it be necessary to fight for independence, but general belief is that possible status of Danzig, not a part of Poland, would not be considered cause of war.

Tenor of Hitler's remarks was polite turndown of President's request for assurance that Germany would not attack some 30 nations, on promise that Roosevelt would attempt to persuade nations to make the same pledge to Germany. Hitler emphasized peaceful intentions of Germany, but said, "No

German shall ever enter a conference defenceless."

Immediate result of speech was adoption by England of army conscription, a move directly opposed to previous policies. Conscription calls for 6 months military training for 200,000 men a year.

Farm Credit News

MORE than \$5,700,000, nearly 15% of Land Bank Commissioner money borrowed by Northeastern farmers since 1933 was repaid by March 31, 1939, according to Springfield Land Bank. Made mostly on second mortgages, Commissioner loans were designed primarily to refinance debts of farmers who were heavily in debt or in dan-

ger of foreclosure. Many Commissioner loans were used to supplement first-mortgage Land Bank loans.

Of 20,810 Commissioner loans made in eight Northeastern states in past six years, 1296 have been paid in full, representing \$2,060,100. Partial payments on 18,450 Commissioner loans have amounted to \$3,687,000.

Good Books to Read

MARGINAL LAND. Horace Kramer. Mr. Kramer's story of South Dakota homesteaders is told with warmth and understanding. SUPREME COURT

Hears Arguments on

Constitutionality of Milk Orders

By CHARLES L. DICKINSON

ON APRIL 24th and 25th the Supreme Court of the United States heard the arguments for and against the Marketing Agreements Act and the Federal Orders covering the New York and the Boston milk markets.

As a spectator seated in the great marble court room, I experienced the thrill of actually witnessing the processes of Democracy in operation to bring justice to all and the greatest good to the greatest number. After sitting through two sessions of the Supreme Court, my faith in the American system has been strengthened and my hope for the future has been carried to a new high. No matter what decision the Supreme Court may hand down, the farmers of the Northeast may be sure that their case will be decided with fairness and justice.

The New York case was opened shortly before four P. M., April 24th. Solicitor General Robert Jackson appeared for the Government and the farmers, asking the Court to reverse Judge Cooper's decision which invalidated the New York Order. Formally dressed in cutaway coat, Mr. Jackson's appearance fitted the dignity of the Court and indicated the respect he held for the Court. Mr. Jackson spoke for about an hour, carefully explaining the provisions of the Order and the Marketing Agreements Act, pointing out why the Government felt that Judge Cooper's decision should be reversed.

In answer to questions by the Justices, Mr. Jackson explained that during the operation of the order some dealers and cooperatives did not comply with the terms of the order and the government had attempted to force these dealers and cooperatives to do so by bringing actions against them in the lower courts. When the lower

court handed down a decision invalidating the order, it was no longer possible to enforce the order and it was suspended by the Secretary of Agriculture pending a decision by the Supreme Court.

Mr. Jackson showed that even though the order had been suspended by the Secretary of Agriculture, the government felt that the Supreme Court should decide on the validity of the order, both from the standpoint of determining whether the non-complying handlers should be required to pay the producers' settlement fund money due during the operation of the order, and from the standpoint of reinstating the order.

The Court adjourned at four-thirty on April 24th and reconvened on the 25th at noon. At exactly twelve o'clock the Marshall rapped for order and the nine robed Justices came to their chairs. Chief Justice Hughes is seated in the center; on his right sit Associate Justices McReynolds, Stone, Black, and Frankfurter, in the order that they were appointed. On Chief Justice Hughes' left sit Associate Justices Butler, Roberts, Reed, and Douglas, also in order of appointment.

Before getting back to the business of following the arguments of the attorneys, I should like to describe briefly some of the outstanding features of the new Supreme Court Building. The massive strength and quiet beauty of the building itself are to me a symbol of all that America stands for. White marble steps lead from the street level up and up, finally broken by a row of marble columns through which we passed to enter the building. The bronze doors open into a great hall with tiled floor and marble walls. At the far end of the hall are the doors

Freeman, son of Gallant Fox, assigned by the United States Remount Service to Wynmede Farms, Slaterville, Tompkins County, New York.

which lead into the court room. A long line of American citizens, some of them school children, continually wait their turn to sit for a few minutes in the Court Room.

In the Court Room visitors sit in the center of the room. Surrounding the room are alcoves where special guests, admitted by ticket secured from the Marshall, are seated. The atmosphere of the Court is one of dignity and strength.

As soon as the Court reconvened on April 25th, Solicitor General Robert Jackson addressed the Court and continued his plea for a reversal of Judge Cooper's decision.

Following Solicitor General Jackson, Attorney Leonard Acker of Brooklyn appeared for Central New York Cooperative Association and against the Government. Mr. Acker was questioned by the court regarding the status of the Central New York Cooperative, inasmuch as Solicitor General Jackson had previously stated that this cooperative was formed originally to get around the provisions of the New York State Milk Control law.

Willard Pratt of Utica, representing Jetter Dairy Company, followed Mr.

Tompkins County Gets Remount Stallion

THROUGH the efforts of William McMillan and Richard Putney, Freeman, a thoroughbred stallion, has been brought to Wynmede Farms, located near Slaterville, N. Y. The Remount Service, a division of the Quartermaster Corps of the United States Army, supplies these thoroughbred stallions to various sections of the country as a means of keeping up the supply of light horses suitable for saddle against some time of emergency.

The Remount Service has no title to sons of these stallions. There are now about 700 such stallions throughout the country, of which five are in New York State and nine in Pennsylvania.

Both Mr. McMillan and Mr. Putney have been interested in light horses as a hobby. Freeman was bred at Clairborne Stud Farm, Paris, Kentucky. As a three-year-old he won one race and placed second in another. He won one race as a four-year-old before being retired to stud.

Acker. Because of a heart ailment, Mr. Pratt asked permission of the court to remain seated during his presentation of the case. Mr. Pratt criticized the Bargaining Agency and the cooperatives that were active in support of the Federal Order. He claimed that the order discriminated against his clients. He was asked to tell in just a few words how this discrimination operated against his clients. His answer was not very clear to the spectators. After talking for an hour, Mr. Pratt was given one minute to finish in order to allow a few minutes of rebuttal by Solicitor General Jackson. At ten minutes after four the New York case was closed to be followed immediately by the Boston case. In this case the positions of the Government and the dealers were reversed. The dealers in this case appealed from the decision of Judge Sweeney who ruled that the Marketing Agreements Act and the Boston Order are constitutional.

The lasting impression I received after spending two days as a spectator in the Supreme Court was of confidence in the American Way and positive hope for the future. The permanence and beauty of the Supreme Court Building; the intelligence and dignity of the nine robed Justices; the atmosphere of the Court Room, set apart from the petty quarrels and selfishness of special interests, gave me a feeling of extreme satisfaction. Regardless of what the decision may be, I am confident that the farmers of the New York Milk Shed will be able to find in the decision the foundation for a permanent program that will bring stability to the dairy industry and make it possible for all groups to work together in harmony for the benefit of all. This is the American Way.

Ulysses Juvenile Grange of Jacksonville, Tompkins County, New York. This Juvenile Grange has 47 members, and all but 11 are in the picture.

This group has been rated an honor Grange for the past six years, during which time it won first prize each year on its exhibits at the Ithaca and Trumansburg Fairs. The Matron is Mrs. Helen Page. She has been Matron for seven years, and has missed only one meeting.

Left to right: 1st row — Irene Baker, Joyce Baker, Elaine Crispell, Sonny Nye, Glen Trembly, Bert Chase,

Marion Poyer, Marie Toby, Jean Poyer. 2nd row — Evelyn Westfelt, Chaplain; Charles Jameson, Overseer; Jack Crumb, Master; Edwin Crumb, Gatekeeper; Albert King, Lecturer; Leah Toby. 3rd row (standing) — Carolyn Crumb; Mrs. Helen Page, Matron; Paul Westfelt, Treasurer; Frances King, Secretary; Edith Baker; Marilyn Jameson; Carol Agard; Anna King, Flora; Helen Baker; Anna McKeel; Frances Ogden, Pomona; Marion Miller, assistant Matron; George Chase; Mrs. Evelyn McKinney, County Juvenile Deputy; Allen Jameson, Steward; Mary Ellen Toby, and Victor Miller, assistant Steward.

Evaporated Milk PART I

By LELAND SPENCER

Leland Spencer

IN THE latest issue, we discussed oleomargarine as a competitor of butter. A matter of even greater concern to New York dairymen is the competition between canned milk and fresh milk. The consumption of canned milk has shown a strong upward trend during the past 20 years or longer. On the other hand, the amount of fresh milk (including cream) used per person was but little greater in 1938 than in 1921. This is shown in table 1.

TABLE 1. ANNUAL CONSUMPTION PER CAPITA OF FRESH MILK AND CANNED MILK IN THE UNITED STATES

Year	Fresh milk* (lbs.)	Milk equivalent of canned milk** (lbs.)	Total milk equivalent (lbs.)	Canned milk in per cent of total
1921	328	20	348	5.7
1925	335	23	358	6.4
1930	345	27	372	7.3
1934	310	31	341	9.1
1936	329	32	361	8.9
1938	335	35	370	9.5

* Estimates for cities and villages, as reported by U. S. Dept. of Agriculture, 1938 estimated by the writer.
** Amount per capita of evaporated and sweetened condensed milk, unskimmed case goods, times 2.2.

In 1921, the consumption of fresh milk averaged 328 pounds for each person in the United States, and canned milk, 9 pounds. This canned milk was equivalent to 20 pounds of whole milk, so the total quantity of milk used both as fresh milk and canned milk was about 348 pounds. Canned milk was between 5 and 6 per cent of the total. Since then, the proportion of the total represented by canned milk has increased to between 9 and 10 per cent.

During the years 1930 to 1934, the consumption of fluid milk was seriously curtailed because of shrinkage in consumer incomes, but the sales of canned milk increased. With rising incomes after 1934, Americans bought more fresh milk, but they did not reduce their purchases of canned milk. In 1938, the manufacturers and distributors of evaporated milk had nearly 10 per cent of the milk market.

Evidently the main reason why the use of canned milk has increased at the expense of fresh milk is the fact that canned milk is much cheaper. The difference in price has increased in recent years, and, at the same time, consumers have become more price conscious because they have less money to spend. In 1921, the average retail price of fresh milk in many cities of the United States was 14.6 cents a quart. The average retail price of a tall can of evaporated milk was 13.9 cents. The difference was less than a cent (table 2).

TABLE 2. AVERAGE RETAIL PRICES OF FRESH MILK AND EVAPORATED MILK IN THE LARGER CITIES OF THE UNITED STATES

Year	Fresh milk per quart	Evaporated milk per 14½ oz. can	Difference
1921	14.6 Cents	13.9 Cents	0.7 cents
1925	14.0	11.4	2.6
1930	14.0	10.1	3.9
1934	11.3	7.5*	3.8
1936	12.0	8.4*	3.6
1938	12.5	7.9*	4.6

* Quoted price raised 10 per cent to adjust for change in size of can.

Since 1921, the price spread has increased. In 1938, fresh milk was sold to consumers for an average of 12.5 cents a quart, while evaporated was priced at 7.9 cents a can. The difference was 4.6 cents. It is true that the milk solids in a can of evaporated milk are a little less than in a quart of fresh milk, but the difference in food value is less than 2 cents.

Considering the difference in price of fresh milk and canned milk, and the fact that millions of families are finding it difficult to buy even the neces-

sities of life, the sales of fresh milk have been maintained surprisingly well. Some further facts on this subject will be presented in an early issue.

Senate Passes Nunan Bill

On May 2 the State Senate passed the Nunan Bill by a vote of 36 to 10, and sent it back to the Assembly for action. The bill as the Senate passed it is in its original form. The clause requiring milk of all breeds to be equalized is left in. Previously the Assembly passed the bill but amended it, taking out the clause requiring equalization of all milk. Therefore, it is uncertain at this time just what form the bill will have when it is finally approved by both Houses.

On the same date the Senate also passed a bill introduced by Senator Rhoda Fox Graves, giving the state power to set a flat price for milk to producers. It would appear that it is the desire of the Senate to place the decision of which bill to sign up to the Governor.

CREAM WANTED

We need more cream, and we guarantee you a steady, reliable market for your shipments.

Accuracy in weighing, sampling and testing assures you highest possible returns for each can of cream.

Payment mailed promptly at top market price. Empty cans returned quickly—thoroughly washed, sterilized and dry.

Selling cream keeps the skim milk on your farm for feeding Calves, Pigs and Chickens, which produces good additional income and helps to build up the farm and dairy.

Ship from your nearest depot—or by truck if there is a route near you.

The FAIRMONT CREAMERY CO.
BUFFALO, N. Y.

Save Time .. Save Work .. Save Money with McCORMICK-DEERING Hay Tools

For quality of materials, lubrication, durability, and smoothness of operation, the McCormick-Deering No. 7 Enclosed-Gear Mower is an acknowledged leader.

The new McCormick-Deering Green Crop Loaders are rugged machines for handling heavy crops. This is the Model R—the cylinder-rake type. Also available is the Model W—the windrow type adapted especially to handling crops. The line also includes the regular type loaders for cured hay.

The new McCormick-Deering Hay Chopper—designed for making molasses silage and corn silage, and for chopping cured hay and straw. A molasses pumping and distributing system is available as extra equipment.

WHETHER you put up cured hay, or green crops for silage, you can do this timely job better, in less time, with less work, and at low cost with McCormick-Deering Hay Tools. This famous line includes tools for every haying operation. There are mowers of various sizes and types for horse and tractor operation, dump rakes, sweep rakes, tedders, side-delivery rakes, loaders, stackers, hay presses, hay choppers.

FIVE NEW MACHINES ARE NOW AVAILABLE:

1. Green Crop Loader (cylinder-rake type)
2. Green Crop Loader (windrow type)
3. Hay Chopper
4. Tractor Side-Delivery Rake
5. No. 15 Power Hay Press

Be ready to go when haying time comes around—see the International Harvester dealer now about these modern, efficient tools.

INTERNATIONAL HARVESTER COMPANY
(INCORPORATED)
180 North Michigan Avenue Chicago, Illinois

There is an unusually wide line of McCormick-Deering Tractor Mowers. This is the popular Quick-Attachable Mower for Farmall 12 and 14 Tractors.

A View of Tomorrow's Highways

Visitors to the *General Motors Highways and Horizons* exhibit at the New York World's Fair will view the world of tomorrow from comfortable moving sound chairs while touring a vast scale model of the American countryside covering more than 35,000 square feet and extending for a third of a mile on several levels of the building. The "futurama" is the largest scale model ever constructed and includes more than 500,000 buildings and houses, over a million trees and 50,000 motor vehicles, of which many thousands will be in motion.

The Portland Cement Association, 33 West Grand Ave., Chicago, Ill., has assembled some information on building and remodeling silos for legume and grass silage. In putting in grass silage some reinforcement is necessary because grass silage is heavier and exerts a greater bursting pressure than does corn silage. The pamphlet is No. CP-44.

Location of the cream separator manufacturing activities of the *International Harvester Company* at the Company's Richmond, Ind., Works has just been announced by Robert Spurgin, Jr., works superintendent. The company recently announced that it would discontinue manufacturing cream separators at Milwaukee, Wisconsin, where they had been made for many years, in order to develop the Milwaukee Works as a large Diesel engine and tractor manufacturing plant. Production of cream separators at Richmond Works is expected to start about July 1.

The Oliver Farm Equipment Co. is introducing the "successor to the plow share," in the form of a new Raydex base and Raydex points. Raydex bases

Above is the conventional plow share. Below is one of the new Raydex points.

will fit any Oliver flat-beam tractor moldboard plow, making it possible to use Raydex points. These new points are so low in cost (80c each in packages of six) that they are not designed to be re-sharpened but to be replaced just as safety razor blades are replaced. These new bases and points were introduced by Oliver dealers for the first time Tuesday, April 4.

Haying time will soon be here. Drop a post card to the J. I. Case Co., Dept. D-6, Racine, Wisconsin, for their new pictorial booklet entitled "Haying". It will give you hints for making better hay.

Handling of meats for 600 chain stores in the metropolitan area was studied by New York State College of Agriculture students as the climax to a week's marketing tour. Henry Ploger, inspector in the Bronx meat warehouse of the *Great Atlantic & Pacific Tea Company*, inspects hindquarters of beef with (left to right) Prof. G. O. Hall, Donald Whitman of Ithaca, George Johnson of Caledonia and Melvin Hurd of Clintondale.

NEARBY MARKETS for NEARBY POULTRYMEN

Chalk White and Chocolate Brown

By J. C. HUTTAR

WHEN a fellow stays too long on one end of a deal his opinion of the guy on the other end is apt to become more and more critical. I had this experience.

When I went into the egg market about seven years ago I carried in the point of view of the producer of eggs.

And I really mean 100%. Naturally, I found some folks who didn't agree with me. That didn't bother me any. I seem to enjoy having someone to disagree with, so long as neither of us is pig-headed about it. For, after all, how's a fellow ever going to learn anything if someone doesn't occasionally tell him something different from what he already knows or believes.

Seven years of marketing has had its effect on this stubborn "so-and-so." The first thing that broke through my resistance was the idea that not every producer was always right. Later on I began to believe that quite a few egg producers do things a little wrong once in a while and some do things wrong most of the time.

Well, you know how such things will grow on you, especially when you're on one end pretty steadily and your speaking acquaintance with the man on the other end gets more and more remote. I think I just got away from the active day to day job of marketing hundreds of producers' eggs in the nick of time. In about another year I'd have been just another egg man in point of view.

Now that I get out among the producers more often I'm getting back in adjustment again. I'm agreeably surprised at the number of poultrymen who have said to me something like this: "We Nearby poultrymen would do a lot better with our market eggs if we took better care of them."

So I'm encouraged to continue passing on to you through the medium of this paper things that I pick up in the market that are for the good of the cause.

Color and Condition

You've read my ideas on appearance before and I'm not going to harp on that but a new development has resulted from the progress we are making along that line and you ought to know about it.

Apparently there are other folks who don't like to sit down and clean a basket of eggs any better than I do. These folks have been looking around for some mechanical means to do the job.

I'm not too familiar with all the different devices used to clean eggs but I find that egg buyers object to some of them. There seem to be some "gadgets" which, in cleaning, give the egg a shine when it's finished. Buyers don't like this shine one bit.

At one of the country egg auctions, where each producer has a permanent lot number by which buyers identify and bid on his eggs, I talked with a buyer who was feeling kind of bad. I asked him what the trouble was and he said, "Come over here and I'll show you."

We walked over to a lot of eggs that had not sold for the best prices

and he pulled one case off the pile.

"Just look at number 165 here", he said as he grabbed a hatchet and started to pry open the cover of the case. "I've bought his eggs for over four years and I have a swell trade worked up on them. Now look at them." The cover was now off.

I'll have to admit that there is just enough egg man in me so that the shine bothered me too.

"The Manager told me what's the matter with them but if I didn't know him as well as I did, I'd swear they were 'sterilized'."

By "sterilized" he meant that they had been sprayed with a mineral oil as is done with many Western eggs that go into storage. Sterilizing marks the egg as storage to many buyers. This thin coating of oil often gives the egg a shiny appearance.

"Now, I've got to quit buying Number 165's eggs", he went on, "and they were such fine eggs."

"Well, can't you explain it to your customers?" I asked.

"I can to a few", he replied, "but, with most of them, the minute you start to explain they begin to get suspicious. Can't you do something with these farmers who shine their eggs?"

The common description of the best priced white egg is "Chalk White". Chalk has no shine and is a good description of what the best eggs are expected to be.

In brown eggs the description of the most desirable looking eggs is "Chocolate Brown." Here again the buyer not only thinks and looks for a certain shade of brown but a flat finish as well.

What To Do

I'd hate to go on record as opposing progress, as represented by the use of mechanical cleaners, but the problem is a real one and not imaginary.

I just had to report it. That's the first step.

Now, the only solution that comes to me immediately (and I admit it's not wonderful) is to take extra precautions to produce clean eggs. Then only touch up the dirty spots. Finally, put the eggs that you have to shine all over, in with the tints and rough shelled eggs, all in a case by themselves so that the bulk of your shipment looks either—CHALK WHITE or CHOCOLATE BROWN.

Have you made arrangements for your Congress vacation July 28 to August 7?

"How come you get no altitude today, Ed?"

NEARBY MARKETS for NEARBY POULTRYMEN

Controlled Optimism

By L. E. WEAVER

"THE BIGGEST fault with these poultrymen is that they are such incurable optimists." The man who made that remark to me is the secretary of a production credit association. He has had a lot of experience in recent years making loans to farmers and arranging repayment schedules.

L. E. Weaver

I suppose I had a look of surprise and inquiry on my face, for he continued: "This past year they have been making a little money. Do you think they came in to pay up? Of course not. They all wanted to build more poultry houses."

I have thought a great deal about that remark. Is optimism a fault? Is it something to be criticised in a person? The dictionary says that an optimist is one who hopes for the best. Surely it is better to go around looking on the bright side of life than to be an old "sour-puss." When I think of the many poultry folks I know, and consider them one by one, I am forced to conclude that they are a bunch of optimists. They do look on the sunny side—at least when I see them. I am thankful that they are that way. Most of them are even enthusiastic about poultry. What sort of poultrymen would they be without enthusiasm?

But I still think that my friend of the P.C.A. is right. Optimism can be a fault—when it is "incurable." I will explain what I mean by giving a few examples.

Mr. A has heard and read all about Pullorum disease, yet he takes a chance on low-priced chicks. His optimism persuades him that these heavy losses can't happen to him. Not so with the "cured" poultryman. He is still optimist enough to carry on. But he says, "the first thing I want to know about chicks is whether or not they are free of Pullorum disease. Nothing

less for me. Not even blood-tested chicks. They must be guaranteed clean."

The incurable optimist puts five hundred chicks around one stove. He heard of somebody who got away with it once. Why can't he? Anyway he is willing to take a chance. The experienced man who can profit by his experience has a different idea. He buys better chicks, but fewer of them. He knows that next fall he will have more first class pullets from his 300 chicks than his overly-optimistic neighbor has from his 500 chicks.

When it comes to deciding where to raise the young stock the successful poultryman does not hesitate. He is successful because long ago he was cured of his foolish optimism. He moves all the colony houses to a new location. He spaces them 100 feet apart or more. He selects a location as far as possible away from the old birds in the laying house. Then he not only hopes for the best, but he knows that he has a right to expect it.

Our cheerful, but incurable optimist argues: "I raised them out by the barn last year and didn't lose many. It makes a lot of work to take care of them when they are scattered all over the farm. I keep the hens shut up all the time. I know a man who never moves his brooder houses. Why should I? Anyway, the thieves will get them if I don't keep them close by."

We could go on and on, telling of the man who never separates the little roosters from the pullets until they are sold as broilers, who forgets to put in the brooder house all summer, who never is ahead of the red mites but gets busy only after they are swarming all over the place, but what is the use?

Apparently all beginners must go through these experiences. If their optimism is of the incurable type they will go on repeating the same errors, and eventually they will be forced out of the poultry business. The curable type becomes an experienced and successful poultryman. He no longer takes chances. Nevertheless he remains an optimist who hopes for the best. As a rule he gets it.

PRODULAC KEEPS A CHAMP in the PROFIT PICTURE

So ill with necro he couldn't stand, says Elmer Pottorf, Galesburg, Ill. hog raiser, but feeding of PRODULAC exclusively brought him around when other means failed. PRODULAC fed as a preventive, not a cure, builds up hogs' resistance, keeps droves in good health—in the profit picture. PRODULAC'S easily digested proteins and carbohydrates and Vitamins A, B, C, E and G make it an extremely valuable supplement to the hog ration. It's economical, too! Order a barrel today and be convinced. Ask your dealer for booklet, or write Dept. 15, Produlac Division, National Distillers Products Corporation, 120 Broadway, New York.

Danger of Infection

Among Baby Chicks

Success in raising baby chicks largely depends upon proper care and management. Readers are warned to exercise every sanitary precaution and beware of infection in the drinking water. Baby chicks must have a generous supply of pure water. Drinking vessels harbor germs. Drinking water often becomes infected with disease germs and may spread disease through your entire flock and cause the loss of half or two-thirds your hatch before you are aware. Don't wait until you lose half your chicks. Use preventive methods. Give Walko Tablets in all drinking water from the time chicks are out of the shell and you won't lose one where you have lost dozens.

Remarkable Success Raising Baby Chicks

"Dear Sir: I see reports of so many losing their little chicks, so thought I would tell my experience. I used to lose a great many of the little downy fellows from bowel troubles, tried many remedies and was about discouraged. As a last resort I tried Walko Tablets. I used two 50c boxes, raised 300 White Wyandottes and never lost one or had one sick after using the Tablets and my chickens were larger and healthier than ever before."—Mrs. C. M. Bradshaw, Diagonal, Iowa.

You Run No Risk

Buy a package of Walko Tablets today at your druggist or poultry supply dealer. Give them in all drinking water from the time chicks are out of the shell. Satisfy yourself as have thousands of others who depend on Walko Tablets year after year in raising their little chicks. You buy Walko Tablets entirely at our risk. We guarantee to refund your money promptly if you don't find them the greatest little chick saver you ever used. The Waterloo Savings Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of our guarantee. Sent direct postpaid if your dealer can not supply you. Price 50c and \$1.00.

THIS SIDE LACKS ROMANCE.—There is a lot of romance connected with the making of maple sugar, and each spring this romance is duly and properly emphasized in poetry, pictures and prose. Quite as essential, but far more prosaic, is the annual wash-up of equipment after the season is over. Here this disagreeable job is in full swing on the farm of Floyd Petrie of Lowville, Lewis County, New York.

G. L. F. Aids Grange Scholarship Fund

The Grange League Federation Exchange is providing an opportunity whereby Subordinate Granges in New York State can earn money to contribute to the Grange revolving scholarship fund. Granges are now able to purchase G.L.F. family foods at wholesale and to sell them to Grange members at retail.

Granges are divided into two divisions—those with 150 or fewer members and those with 151 or more members. At least half the profits must be contributed to the fund. The other half may be used by the Grange for its own purposes. Reports must be sent to H. M. Stanley, Skaneateles, N. Y., by May 20 in order to be considered for prizes offered by G.L.F. To the Granges most active in this project, the following prizes are offered: first (in each division) a white de luxe electric range; second (in each division) an electric five unit coffee maker; third (in each division) an electric cooker with automatic heat control.

Grange Gleanings

(Continued from Page 11)
be held in the beautiful old brick church at Claverack, one of the historic edifices of the Empire State. A similar service in that church last year drew an attendance of more than 600.

BECKET subordinate in Berkshire County, Mass., supplies an interesting example of a Grange "casting its bread upon the waters". For a long time the Grange has met in the public school building of the village, and a few years ago joined its energies with the local church in fitting up an annex to the church edifice that should serve for social purposes for both organizations. The Grange members gave time and labor generously, and the annex proved well-nigh invaluable. Now the town has been obliged to take over its entire building for school purposes, so Becket Grange has moved its meeting-place into the church annex.

EDWARDS GRANGE, No. 968, St. Lawrence County, N. Y., includes among this year's officers Hubert Chapin Lathan, who has just passed his fifteenth birthday, and his grandmother, Mrs. Margaret Chapin, a long-time worker in Edwards Grange. The young man joined as soon as he reached his fourteenth birthday and has entered very actively into the work.

THE NEWEST Grange hall in New York State has just been officially opened and is the \$8,000 home of Horseheads in Chemung County. The new building is thoroughly modern in every way, with a seating capacity of more than 200, admirable kitchen and dining-room facilities, and first-class heating and lighting equipment. Horseheads Grange is one of the old subordinates of the state, dating its existence back to the spring of 1874.

HANOVER GRANGE in Connecticut is heartily backing the Grange baseball team and has held various money-raising functions to help out the finances of the team.

GOLDEN SHEAF GRANGE, No. 587, of Hannibal, N. Y., celebrated its 50th anniversary on April 15. A gold certificate was presented to Harvey Perkins, the only living charter member of the Grange. Silver certificates were presented to Roy Hall and Mrs.

Fannie Tucker. Lester Lonis was the first Master; his son, Ernest, was Master on the 25th anniversary, and his grandson, Maynard Lonis, was Master on the 50th anniversary.

"Yes", Say 92 Per Cent

(Continued from Page 10)
anywhere. We must all get together on one way that will bring us cost of production and a living wage. I received \$1.19 per hundred for 3.5 milk for March. I paid my drawing bill and feed bill, and had \$8.50 left for two tons of hay, three tons of ensilage and my work for 31 days. Now, a man cannot get along this way, and I wish some of the chiseling dealers had to try it.—H. R., Steuben County.

I think the Federal-State Agreement is far from a cure-all, but I see nothing better in sight so do your best for us, Ed.—F. R., Delaware County.

All was well here until independent dairymen made trouble. *American Agriculturist* is the only farm paper that I read and depend upon.—E. N., Wyoming County.

I think the recent amendments to the Nunan-Allen Bill have provided a hole that will let so many special milk groups crawl out that it will void the effectiveness of the act.—C. R., Steuben County.

I feel sure that the Nunan-Allen Bill will bring the greatest good to the largest number and have therefore supported it. However, as a producer of Golden Guernsey milk, with a special market I have helped create and pay for, I do feel my personal income will be reduced under inclusion of "all breeds" clause. I have not worked for personal interest in this matter.—H. S., Onondaga County.

I wish to thank you for the stand you have taken for the dairy farmer in New York State, and I trust and pray that every milk producer may see the need of getting behind this movement to stabilize our markets and prices on milk.—C. S., Wyoming County.

Poultry Congress

(Continued from Page 1)

financing exhibits but that is all. Each state has been given a quota of \$1 memberships and some states, including New Jersey and New Hampshire, have already met their quota. Pennsylvania's quota is about half met, and most other northeastern states, with the exception of New York, are within sight of the goal.

The first question likely to come to any poultryman, poultry equipment or feed dealer, or in fact anyone whose living depends on the poultry industry, is this: "Why should I buy a dollar membership in the Congress if I do not plan to attend?"

The answer is that holding the Seventh World's Poultry Congress in this country will put "pep" in the industry. The dollar that you spend will be returned many times over in coming years. It is true that you may get the benefit without spending the dollar, but who wants to ride on a free ticket?

This return to you will come mainly as a result of an extensive program to show consumers the value of eggs and poultry in the diet. In the Food Palace, covering 19,000 square feet, will be a demonstration booth known as the transparent kitchen, where, in full sight of consumers, trained demonstrators will show new uses of poultry and eggs. Some years ago the Poultry Congress was held in Ottawa, Ontario, and during the following year Canadian consumers used 30 per cent more poultry products. Just to be conservative, it has been calculated that a 5 per cent increase in egg consumption in this country would benefit the poultry industry more than the entire cost of the Congress.

In addition to seeing the biggest affair the poultry industry has ever put on, a trip to Cleveland will give you an opportunity to see some of Ohio's chicken farms and some of the industries associated with the business. Daily tours have been arranged. You can see the Quaker Oats factory at Akron, visit a tire manufacturer, an egg auction, a fish hatchery, Oberlin College—in fact, pretty nearly every point of interest you may want to see.

The Tours Committee has arranged a variety of these trips which will be repeated each day so you can choose the ones that interest you most.

There is yet another benefit—the value of which cannot be measured. In the past the poultry industry in this country has been notoriously unorganized. Never before have all phases of the industry, including producers, college poultry departments, egg distributors, meat packers, equipment manufacturers and feed dealers, become so united in a common purpose. The organization required to stage the World's Poultry Congress will not evaporate the day after the Congress is over. It will be the foundation for a better, organized poultry industry.

It may be that you have already been approached by a local poultryman and asked to buy a dollar membership in the Poultry Congress. Perhaps you turned him down. If you did, there is still time to change your mind. At any rate, if as yet you haven't contributed your dollar to support the Congress, send your name and address and \$1 to Howard Waugh, Department of Agriculture, Albany, N. Y., and he will see that you get your membership which you can use as a season ticket when you attend the Congress.

Fashion "Firsts" for Summer

by
MRS. GRACE WATKINS HUCKETT

2671

2680

2788

2654

WITH the advent of really warm weather, crisp sheers, smoother surfaces, low necks and cool-looking and cool-feeling fabrics and styles will hold forth. Dainty, feminine touches will relieve the severity of the tailored styles, for "prettiness" must be effected. Lace appears everywhere from lingerie touches at the neck to ruffles on skirt or petticoat. Speaking of petticoats, some of them are edged with eyelet embroidery ruffles headed with beading and ribbon trim. For evening wear, some of these may even have a flexible hoop.

Tucks, shirrings and pleats are used ingeniously to flatter the human figure. Trapunto quilting sometimes enhances short jackets. Jackets are just as important as ever; a new touch is afforded by wearing a gay print bolero over a plain dress, even a dark one. Lots of little linen jackets will be worn with summer dresses of all kinds.

The lingerie fashion revival gives impetus to organdy, batiste, dotted swiss and embroideries. The evening favorites are organdy, organza or net, especially one with a "burned out" figured effect. The stiff weaves are popular in the more formal evening gowns of taffeta, marocain, poplin and beautiful old-fashioned brocades. A particularly striking slim evening dress of silk crepe has huge single flowers in gay, natural colors. Metal accents are quite good in these more formal gowns. Generally speaking, this season's materials are stylized in design rather than naturalistic; this applies to floral prints particularly. More water repellent materials are being shown. New spun rayons have linen-like texture, are crisp and sheer. (Continued on Opposite Page)

2718

2692

2143

2822

Even the pure linens are more crush-resistant than formerly.

The princess model almost invariably has a full swirling skirt. Sportswear is gay and colorful, often using the tri-color theme, blouse of one color, skirt of another and belt of still another. Unusual color combinations are seen in all clothes this season, fuchsia with navy, spice with violet, chartreuse with navy, etc. Greens, violet and lavender tones and unusual browns are constantly seen. Wild cherry and lipstick red are excellent for accent. The Queen's visit is expected to influence woollens particularly. Since she is Scotch, plaids will no doubt be affected.

Parma violet, clover pink, hyacinth blue and tulip yellow are some of the so-called windowbox colors. Gypsy colors and gypsy fashions are likewise sponsored by Paris.

The "little girl" look in grown-up clothes continues important, including starched linen Eton collars, Windsor ties, fitted basque bodices and skirts flared over lingerie petticoats. Peasant influences show themselves again in wide waist bands, bloused bodices and gathered skirts. Sometimes suspenders are joined to the waistband. Daytime silhouettes continue emphasis on fitted waistlines and flared skirts. Squared shoulders are routine for tailored fashion and skirts are shorter than ever. The princess type although fitted closely from the hips up is distinguished by wide swinging skirt.

PLAY ENSEMBLE PATTERN NO. 2671 is complete within itself for tennis, hikes or beach wear. The sunback halter shirt is attached to the smartly flared shorts, with skirt and jacket separate for quick and easy donning. White sharkskin with red jacket and buttons would furnish a dashing scheme. Pattern sizes are 12, 14, 16, 18, 20 years, 30, 32, 34, 36, and 38-inches bust. Size 16 requires 3½ yards of 39-inch material for playsuit and skirt; and ⅞ yard of 39-inch material for bolero.

DRESS PATTERN NO. 2680 is charmingly feminine yet easy to make and care for. The sloping shoulders are distinctive, while the softly draped front of the bodice is universally becoming. Smooth hips and flaring skirt are outstanding fashion details. The soft sheers either in silk, rayon or cotton are especially suitable for this delightful design which comes in pattern sizes 14, 16, 18, 20 years, 32, 34, 36, 38, 40, 42, 44 and 46-inches bust. Size 36 requires 3¾ yards of 39-inch material.

DRESS PATTERN NO. 2654 with its close-fitting basque and swinging skirt provides the "little girl" look so strongly in favor just now. This is a design which will go anywhere, is particularly useful for the sweet girl graduate. In short length it can be worn on the street, while formal length will take it to dances or other evening affairs. It may be made of silk, rayon, linen or sheer cottons. Pattern sizes are 12, 14, 16, 18, 20 years, 32, 34, 36, 38-inches bust. Size 16 requires 3½

yards of 39-inch material with 1 yard of ribbon for bows.

TURBAN PATTERN NO. 2822 is absolutely new and is a real find in headdress. Made in foam white rayon crepe, it goes with almost any outfit while gayly colored materials give it a real sport appeal. For evening wear rayon mesh is suggested. It is also a simple matter to make one to match any dress you might have. Material requirements are stated on the pattern envelope.

PANTIE DRESS PATTERN NO. 2143 is most fetching with the duck applique on the pockets. (Applique pattern included). This is an outfit of charming detail, dainty puffed sleeves, pleats inset, high pockets and flaring

Ready for Summer!

SUMMER, with ice skinking in tall glasses and warm breezes wafting over the countryside, calls for lovely ladies in cool frocks. Styles for all occasions for everybody, old and young, slim and stout, vacationer and stay-at-home are all included in our Summer Fashion Magazine. Besides, it includes ideas for wardrobe planning, warm weather hints and a summer fashion forecast. Send 12c for this new full color book right away. Address Pattern Department, *American Agriculturist*, 10 North Cherry St., Poughkeepsie, New York.

skirt. Pattern sizes are 2, 4, 6 and 8 years. Size 4 requires 2 yards of 39-inch material with ¾ yard of 35-inch contrasting for dress; and ⅞ yard of 39-inch material for panties.

PRINCESS DRESS PATTERN NO. 2692 is one of the season's pets, with fitted bodice, puffed sleeves, swirling skirt and cool heart-shaped neckline. The pattern includes shirt-neck variation if that is preferred. Sizes are 6, 8, 10, 12 and 14 years. Size 8 requires 2 yards of 39-inch material with 1½ yards of binding.

TOT'S PANTIE DRESS PATTERN NO. 2718 really is two comfortable and practical play outfits for sister and brother. Sister's dress buttons down the front and has dainty ruffled trim whereas brother's outfit would be quite tailored looking with white contrasting collar. The panties have elastic at the waistline. The whole costume is designed to help Mother in training the little folks in self-help. Pattern sizes are 1, 2, 3 and 4 years. Size 4 requires 2¾ yards of 35-inch material for dress and pantie with 1½ yards of ruffling.

COAT DRESS PATTERN NO. 2788 with its slim princess lines is wonderful for house or beach wear. It is extremely easy to make and easy to iron. Make with shirt collar or rever vee collar. Belt and pockets are optional. You will probably want to use this pattern many times over. Pattern sizes are 14, 16, 18, 20 years, 32, 34, 36, 38, 40, 42, 44, and 46-inches bust.

TO ORDER: Write name, address and pattern size and number clearly and enclose 15c in stamps. Address Pattern Dept., *American Agriculturist*, 10 North Cherry St., Poughkeepsie, N. Y. Add 12c for a copy of our new Summer Fashion magazine. Our new **BRIDE'S BOOK** will be a big help in carefully planning a trousseau. For a copy, enclose 10c extra

MUFF—A Serial Story

By C. A. STEPHENS

THE STORY THUS FAR

Christened Henry Nemo, the name "Muff" stuck to our hero because his mother tucked him into a muff and abandoned him on the doorstep of two New England spinsters. A crimson birthmark around his neck was referred to by village gossips as "the gallows mark." At an early age he began to train animals. He exhibited two trained steers at the Fair which, against his desire, were sold for \$80.

When 14 he was hired out to farmer Glinds for \$7 a month. He refused to stay and Glinds refused to pay him. Thereupon Muff stole oats from Mr. Glinds' bin equal to the value of the work he had done. He was discovered, arrested, and sentenced to Reform School. On the way there he escaped.

* * *

CHAPTER IV.

THE room was empty. Muff had taken French leave. But in what clothing? Sheriff Markhead had removed every stitch of the boy's clothing to his own room the previous evening.

The dormer window in the hotel roof was open, and it appeared that he had got out on the roof, thence dropped to the roof of the L, one story lower, and so made his descent to the street.

Later it was found that there was a trunk under the bed, belonging to one of the servant girls, and containing her private wardrobe. From this were missing an old gingham gown, a straw hat with a pink ribbon, and some other clothing. The clothing was fully described to Sheriff Markhead by that indignant servant girl, who demanded pay for it, at her own figures, on the spot. He spent the day searching the town, trying to hear of Muff, but could get no clew, and the next day he came home in his "meat-cart."

The man was well laughed at, as he deserved to be. To treat the boy, any prisoner in fact, in that odious way, was an outrage on decency. But Muff should have gone on, of his own accord, to the school and surrendered himself there.

It is only lately that I have learned the story of Muff's adventures for the next two months, for at the time of his escape from the sheriff, and for a long time thereafter, we heard nothing from him, and did not know what had become of him.

After getting from the roof of the hotel to the ground, he hurried out of the village and proceeded for several miles along a wagon road, leading he knew not whither. He meant to make a detour through the country, and come back secretly to the old mill. His plan was to get his lathe, tools, saws, and other property at the mill, and then go off to a distance, and set up again in the woodturning business. With this idea he travelled all the remainder of the night. At dawn he took refuge in a little thicket of low pines, and remained hidder there all day, having nothing to eat save the leaves of young checkerberries which grew in the thicket. Once he was on the point of being discovered, in fact was discovered, by a passing sportsman, whose dog ran into the thicket and barked. But the young man, on catching sight of the gingham gown and hat, hurried away, and Muff, in much trepidation, retreated with equal celerity to deeper recesses of the thicket.

As soon as it was twilight, he came out to the road and went on again, but either from lack of proper food or from nervous excitement, he was immediately seized with nausea and extreme pain, and after staggering forward for a mile or so in great distress, was obliged to call at a house,

which chanced to be at the little Shaker settlement in the town of F.....

In faltering tones Muff sought and obtained permission to stay over night at the house, for these good people sometimes entertain wayfarers. They seemed to see nothing amiss in him, or rather, nothing except a miss, for he was, it must be remembered, a small, effeminate-appearing boy of fourteen. After drinking a cup of hot tea and eating some supper, he felt better, and was presently shown to a room where "world's people" were accustomed to be lodged.

In a closet connecting with this apartment were hung away a number of old garments, such as are worn by the Shaker men and boys—coats and pantaloons of gray-blue cloth, and several of the peculiar broad hats. Selecting a suit from these, the vagrant Muff contrived to make up an outfit.

Making a very early start, he departed without attracting attention, leaving the good Shakers to cipher out the metamorphosis as best they could.

A very long walk that day, by devious roads to the eastward of the more direct route, brought him around, at a late hour, to the old mill, where he passed the night, finding things much as he had left them weeks before, and feeling quite at home again. Muff even called at Marcia's cottage, and was covertly supplied with food by his old foster-mother. He lay hidden at the mill for several days, but dared not remain longer. Setting off again, he "located", after devious wanderings for a week or more, subsisting as best he could in an old clapboard mill in the township of M——, twenty-five or thirty miles to the northeast of the Corners. In September he came with a horse and cart, which he had been able to hire, to the Corners, by night, and took away from the old mill nearly all his property there. Marcia was the only one who knew of these visits, and she said nothing to anyone.

Throughout the summer and fall he lived at this clapboard mill, which he hired of the owner for a trifling sum, and did some sawing in addition to his more fanciful work and experiments. His bias now seems to have

been strongly towards mills and machinery. At M—— he was known as the "young Shaker" and was thought to be a boy who had run away from the Shaker village. There is no complaint that he was not perfectly honest and correct in his dealings at M——.

During September the water of the stream became too low to turn the wheel. The deficiency in the water supply stimulated Muff's inventive faculty, and he erected a large windmill. Finding, as hundreds of others have found, that wind power cannot be depended on for steady work, he got over his difficulty by using the windmill to pump water up from the mill pond into a large tank which he constructed, at a considerable expenditure of time and labor. From the bottom of this tank he had a pipe, made of pine logs, bored and rimmed out, five inches in diameter, leading down upon a little water-wheel, somewhat like a turbine, which he had made himself and set, under his mill. The water fell twenty feet through this pipe, and with force sufficient to run his lathe and a small circular saw. Thus, by combining wind power and water power, he secured what he needed.

But this contrivance was only good for warm weather; in winter it would freeze up and be useless. Foreseeing this, Muff determined to substitute little pebbles, about the size of peas and beans, for water; these he thought could be raised by the windmill and would rush down a pipe upon an "over-shot" wheel with even greater effect than water. He set up a model to prove it, before building on a large scale, and found it to work so well that he began to dream of getting the device patented and making a fortune from it.

His combination of wind and water power was thought to be a very curious thing at M——; a good many people came to look at it, and it was through the curiosity excited by it that his history was at length found out.

Two men from the Corners, who had gone up to M—— to work at lumbering through the winter, were attracted to the mill and at once recognized him. On their return home in March, they told the story. The news came to Mr. Glinds' ears, and he lost no time in notifying Sheriff Markhead. That officer, still smarting from the jeers of his fellow citizens, at once proceeded to investigate the matter. He took a

Hope

The day will bring some pleasant thing.

I tell myself at each new dawn;
Some bright, unlooked-for happening
To cherish when the day is gone.

This heartens me to take my way
Among the problems of the day.
Sometimes a letter, long delayed,
An unexpected gift or call;
Sometimes a casual word of praise,
Or friendly handclasp may be all;
But something fresh and unforeseen
Breaks into every day's routine.

Just watching for these pleasant things
Saves from monotony the day,
And helps to give my spirit wings
To rise above the humdrum way.

—By Lois Edith Swett, c/o A. M. Campbell, Derry Village, N. H.

man with him, and driving to M....., made a strategic descent on the clapboard mill where he captured Muff, who sat bunching clapboards. This time we may be sure that he did not spare any vigilance. It is said that he tied the boy hand and foot with ropes. In fact, he performed his unpleasant duties so successfully that thirty-six hours later, he landed him within the gates of the Reform School at Cape Elizabeth—just ten months to a day from the time he had first set off with him the previous year.

To be caught was, after all, perhaps the best thing that could have happened to Muff. Running away from justice is always unwise. It seems a hard thing, but if a person, man or boy, has broken a just law, it is better for him to atone by a just penalty; and if he has a true, manly spirit, I honestly believe that he will feel the better for making such atonement.

The State Reform School of Maine, located at Cape Elizabeth, near the city of Portland, is one of the very best institutions of its kind in the country. A Reform School is, of course, more or less a penal institution, at best; but this school has always kept the object of its foundation steadily in view, namely, to reform rather than to punish those poor boys who, from various errors, mistakes and waywardness, have been committed to its coercive care and instruction.

The buildings are large and constructed on good sanitary principles. There is a fine farm adjoining the school, where such of the boys as can be trusted outside the gates work on the land for a certain number of hours daily and are taught farming. There is also a work-shop inside the building where the boys are taught a trade—of late, mostly weaving rattan, cane, and the business of chair bottoming. But the best part of the day is spent in the schoolroom, under the instruction of three or more experienced teachers. What is equivalent to a fair English high school education may here be obtained by such of the boys as can be induced to study. For the founders of the school fully believed that ignorance and crime not only go hand in hand as a rule, but that the former is generally the cause of the latter; and that education is the best general remedy for it.

The school has a fine library, and the

The Song of the Lazy Farmer

WE HAVE a lot of surpluses in farmin' and they spoil our biz, we might be rich and prosperous except we grow too much surplus. Them speculators in the pit just take that surplus and with it they hammer down the price until there tain't no money in our till. Of all the surplus we have got, the one that's worst, as like as not, at least it seems that way to me, is our surplus of weeds, by gee. Them other things can fill our needs, but when it comes to surplus weeds they haven't got no use at all, they grow all summer and all fall, they sap the goodness from our land, they grow and thrive on ev'ry hand, they grow in fields and by the fence, and all they do is make expense.

The cost of farmin' would be less by half, without no weeds, I guess; they make us plow and cultivate, we fight 'em early too and late. When we must quit and go to bed, them weeds keep growin' on

instead of restin' like a good weed ought, and so no matter how I've fought I can't keep up with them there weeds, there's more than anybody needs. Dame Nature surely played a joke on us hard-workin' farmer folk when she made weeds, our life would be serene without no weeds, by gee. I hope when life's short span is o'er and I go to a better shore, where man has ev'rything he needs, that heaven will be free from weeds!

Prelude

By AMY ATWATER.

I hope that I can add
At least one lovely strain
To this short prelude "Life"
Which we all love;
So when I go to join
In that eternal symphony
That plays above,
Some lovely haunting note
Of mine
Will linger on,
Exquisite melody
In friendly hearts
Long after I am gone.

boys are encouraged to read books as well as study. The students here (I will not call them criminals) are well fed and well lodged and, if sick, are carefully attended.

Boys from eight to sixteen years of age are received into the school; and such of them as are seen to be bad and hardened are kept apart from the younger and better class. Though virtually prisoners at first, liberty is given to the boys as soon as they are found to be worthy of it, even to the extent of leaving the school and going into business elsewhere. In such cases they have merely to report to the superintendent at stated times. Reform is the one essential thing insisted on; towards this end the entire energies of the school are directed; and if a boy be wayward and predisposed to crime, nothing better perhaps can be done for him than place him here for a few years.

If Mr. Murch, in his rough but kind way, had been able to take Muff to the school, and give him a bit of friendly advice, I have not the least doubt that the boy would have accepted his punishment in the right spirit, and behaved so well that he might soon have been given his liberty again. But the brutal manner in which he was carried there by Sheriff Markhead, and the cruel twittings of superstitious people about the "mark" on his neck, developed in him a rebellious, vindictive spirit. In his heart he began to hate the whole world indiscriminately and unreasonably. The desire for revenge grew in his mind, and overpowered common sense—so much so that I can myself no longer attempt to excuse him, or ask the reader to do so.

On his arrival at the school, the superintendent naturally took him for a young desperado, for the sheriff had him bound hand and foot with ropes, and had a second man with him for a guard.

"Put him in the tightest place you've got", said the sheriff. "He's a hard biscuit! I've been ten months getting him here!"

The superintendent therefore met him rather sternly, if not unkindly, and had him lodged in a room by himself 'till morning. The windows were securely barred; and as Muff glanced

about him and at that iron grating, rage, spite, and injured feeling filled his heart.

There was a little looking glass over the washstand; he tore open his collar, and looked at the "mark" round his neck. It appeared to grow redder, and to mock him. "Gallows" seemed to be written in palpitating red letters round it. "Born to be hung. Born to be hung," rang in his ears. That old taunt which had burned itself in his brain, now, in his intense nervous excitement, cried out, or he fancied it, in audible accents. All night long he paced or tossed about, a prey to desperate thoughts.

Toward morning, growing a little less fierce, he settled down upon a resolve to escape at any cost, and then—he knew not what he might do. He had passed the point where he ever expected to be an honest man, or anything save an outcast; he cared not what became of him, or what crimes he committed. Such is the usual way of the human heart. Many crimes are the result of despair.

In this mood, sullen, venomous, the superintendent found him when he unlocked the door next morning. Breakfast was brought for him, but he hardly touched it; a lump of pent-up rage kept rising and prevented him from swallowing much, and not a word could the superintendent get from his lips.

Knowing that labor is the best panacea for such moods, the superintendent bade the boy follow him to the workshop, and set the foreman there to instruct him in weaving cane chair bottoms. It is a somewhat difficult task, requiring considerable time and practice to do it deftly. Muff watched the others for a minute or two, without paying much attention to the foreman's words of primary instruction, and then surprised that good man not a little by taking the strands in hand and doing it as well as anyone.

"That new boy of yours is a smart one", he said to the superintendent later in the forenoon. "He's got the eye of a born mechanic in his head."

The superintendent, who was a judicious man of large experience with bad boys, determined to wait a day or two, and then try again to converse with Muff. He wished to find out what private grievances had so embittered the boy, and hoped soon to divert his mind from them and get him in a better mood by kindly sympathy. He saw that he had a well-shaped head and a good face, but for its expression of sullen gloom.

That day Muff took his dinner and supper with the other boys in the large dining room situated in the basement, and was given a cot that night in one of the large dormitory rooms where forty or fifty similar cots were arranged in rows. A light is kept burning in the room; and some one of the attaches of the school is supposed to act as watchman through the night, though the gates and doors are all securely locked.

Nevertheless, next morning at roll-call the "new boy" was missing.

He had not spoken a word since entering the building; but he had apparently used his "eye of a born mechanic" with diligence while in the basement the previous afternoon.

For purposes of ventilation there were constructed beneath the floor of the basement several brick conduits, serving as air passages. In size these were not more than a foot and a half square. The floor over them at this time was not in good repair, being much worn; and it was immediately discovered that the new boy had left his cot, descended to the basement, and, digging up the floor, had crept out by one of these old air conduits. Along this narrow passage he had made his way by hard wriggling—for they found several of his buttons—to the outer end, where he had forced off the grate and escaped.

(To be continued)

Kernels, Screenings and Chaff

By H. E. BABCOCK

SPRING seems to be here in fact, as well as by the calendar. With its arrival hope comes to life in the hearts of all true farmers.

At Sunnygables we face the year which is ahead with more uncertainty than we have felt in a good many seasons. We are going right ahead with our plans for producing a lot of forage which I reported here two weeks ago. *When it comes to the use we are going to make of this forage, however, we are keeping wide open as far as future plans are concerned.*

STRONG LIVESTOCK MARKET

Since the first of January we have sold all of our livestock except one flock of sheep and some 50 head of Guernseys. We really didn't intend to let so much stuff go but we advertised it in the *American Agriculturist* and almost before we knew it we had sold our entire Angus herd, our flock of Grade Hampshire ewes, our Hereford heifers and quite a few Guernseys. In other words, the market was stronger than we appreciated and we sold ourselves short.

To utilize pasture which would otherwise go to waste, particularly during May and June, we have bought a carload of Hereford heifers. This solves our temporary livestock problem but doesn't take care of our situation this fall. We should winter the equivalent of about 300 head of cattle of all ages. Of these, even if we keep our present flock of sheep, all of our Hereford heifers and all of our Guernseys, which we probably won't, we will have less than half the stock we need on hand this fall.

WHICH WILL PAY BEST?

Here are some of the questions we are debating:

1. Shall we keep our Guernsey heifers, which are going to freshen this fall, and thus get into producing milk, or shall we sell them? If we sell them, of course we will have less livestock to feed.
2. Shall we take advantage of the slump in dairy cattle prices and buy up a lot of open dairy heifers to feed next winter?
3. Shall we try our hand at feeding lambs? I don't think this would be as risky as it sounds because of Hank's natural ability with sheep.
4. Shall we buy some more Hereford heifers next fall?
5. Shall we leave part of our silage untouched next winter and get set to sell a lot of hay? We have always

wanted to try baling *chopped* second cutting alfalfa and clover for sale.

My object in analyzing our situation is not to impart any wisdom to anybody because we will probably keep our decisions, either right or wrong, to ourselves, but to bring out as graphically as I can what a northeastern farmer is up against who does not produce milk for market or who, as so many farmers are thinking of doing, stops producing milk. I just want to start some of you readers, who are talking about selling your dairy herds, doing a little thinking.

POULTRY STAYS

Of course, there is one enterprise at Sunnygables which I haven't discussed which is permanent and which will go on full blast. I refer to our poultry. This fall we hope to house close to 4,000 layers and I hope we have learned our lesson so that we never will again be caught with empty laying pens. Over at Larchmont we have set up so that Ross can produce 4,500 pullets a year and Sunnygables, as a matter of course, will have first claim on these birds.

CONTAGIOUS ABORTION

I am going to end up this rambling discussion about the problems of a northeastern farm which does not produce milk by saying a little something about contagious abortion in cattle. As I write this, I have before me a chart

which shows that every animal I own is negative to the Bang's test in *all dilutions*. Now, strangely enough I am not very much elated by this condition. It simply means that while I am enjoying certain temporary security my whole herd is vulnerable to the first infected animal which gets across the line fence, or for all I know, to the first visitor who tramps unconcernedly down the feed alleys.

I said the other day to a friend that the test and slaughter program of Bangs abortion control had cost me more money and done more to kill my interest in good cattle than anything which had happened to me in my lifetime. I may be successfully challenged but I don't think it is getting anywhere. Mind you, I am writing this as the owner of an absolutely clean herd. But clean though it may be, if I ever get a break, I have about come to the conclusion that I am going in for calfhood vaccination or else no testing at all and so far as I am concerned the buyer can then take my cattle or leave them as they stand.

SOIL CONSERVATION

We are going back into the soil conservation program. We can't afford longer to pay taxes to buy lime and superphosphate for others without getting some of it for nothing ourselves. It is a partial antidote for a ruinous price level.

Hothouse Lambs

The returns are all in on this season's hothouse lamb crop and, as I promised last fall, I am reporting the results.

Hank saved 130 lambs from the 125 ewes. He marketed his first lambs on the 29th of November and his last at Easter time. The highest price we got was \$11 each for three lambs on December 27. The lowest price was \$8 for a lamb on the 31st of March. The net average return per lamb was \$8.43. The heaviest lamb Hank killed weighed 61 pounds alive; the lightest, 38 pounds. The average weight was 47 pounds. It took an average of 66 days to finish an average lamb. In reviewing our operation I am struck with the fact that our marketing costs were too

American Agriculturist, May 13, 1939

high in percentage. They averaged about \$1.25 a lamb.

The ewes came through the winter in splendid shape. If anything they were a bit too fat when we turned them out on May first. We put rams in with them on April 15. Last year we used both Southdowns and a specially selected Hampshire ram. This year we are repeating the use of the same rams. It may be just prejudice—I haven't any figures to back up my opinion—but it seems to me that the lambs sired by the Southdown rams finished off just a trifle quicker than those sired by the Hampshire and that they made a more pleasing carcass.

This year our hothouse flock ewes sheared better than ever before. I think both the better lamb crop, so far as making the hothouse market was concerned, and the heavier shearing are due to the fact that we are using better ewes and that Hank has learned more about feeding them.

The basis of our ration for the entire flock was hay ensilage and chopped second-cutting alfalfa hay. While the lambs were nursing they had free access to grain in a creep. By the time they were ready to go they were eating quite a lot of grain. We also kept nice chopped, second-cutting alfalfa before them in the creep and I have a hunch that this was nearly as valuable in promoting growth as the grain they ate.

* * *

Winter Barley

Our winter barley has come through the winter in grand shape. It is several inches high now; has a dark green color, and certainly gives evidence so far as winter-killing is concerned that *it can take it*. Of course, whether or not we will get a crop will depend on the weather from now on. Just at present it is a little too cold and dry for anything to grow well.

The winter barley we are growing this year is a strain we got from Virginia. It is characterized by having a very stiff straw and barless awns. In its native state it has been making some remarkable yields.

We aren't so much interested in the yield we are going to get, because the barley is growing on a field we didn't get around to top-dress last winter, as we are in determining whether or not we have a strain which can stand our Central New York winters.

Hank makes a final checkup on his shipment of hothouse lambs for the Easter trade. This year we got a 100 per cent crop of hothouse lambs and consistently topped the market with our shipments.

Protective SERVICE BUREAU

Conducted by H. L. COSLINE

MEMBER
AMERICAN
AGRICULTURIST
PROTECTIVE SERVICE

Courteous and Fair

Under the heading "Unordered Merchandise" an item in the February 18 issue referred to a shipment of SCAL-ENEMY WATER and METAL TREATMENT which a subscriber stated he did not order.

This shipment was the result of a misunderstanding, and was promptly and courteously canceled when the facts were brought to the attention of the Universal Refining Products Co. of New York City. This concern has been in business twenty years, has built up an excellent reputation, and the company emphatically states that it does not follow the practice of shipping unordered merchandise.

In the interest of fairness we are glad to give this information to our readers.

Action Before Consideration

"Finally, he said that if I entered the filing supervisory course I would have to sign that day because they wanted executives who could make decisions without parental or friend's advice."

This is a paragraph from a letter from a young school teacher who signed a contract obligating her to pay \$148. for a correspondence course on the installment plan. In our opinion the quotation above would have been sufficient to warrant caution. Of course the agent is anxious to get immediate signature before there has been time to get advice from older and more experienced people.

The ability to make quick decisions after one has the facts is admirable, but a proposition that won't stand a bit of investigating deserves to be turned down.

Pig in a Poke

"An agent from a New York City firm has been trying to interest me in buying lots at Muscle Shoals. He tells me of the building that is going on there and that a five billion dollar business was going to open. He indicated that the lots were going to increase in value. I am interested but wish to check first."

It is always wise to investigate before investing. We are told that many lots in the vicinity of Muscle Shoals have been sold at exorbitant prices, and that promises of resale for profit have not been carried out. As a general proposition we always advise against the buying of lots at a distance as a speculation. An enormous amount of money has been lost in this way.

"Pictorial Review" Suspends Publication

The "Pictorial Review" has definitely suspended publication. The Hearst Publications is communicating with all subscribers to "Pictorial" whose subscriptions have some time to run, offering them some substitute magazines for the balance of the subscription period.

Chicks Not Shipped

"I ordered some chicks and received a card that they would be sent April 17th. They did not arrive and I have asked for the return of my money but as yet have received no reply."

Hatches are sometimes smaller than expected, making it impossible for a hatchery to fill orders on the date required. However, it sometimes appears that a shipment is postponed from week to week causing a great loss to poultrymen because pullets will not come into production when he planned. When a hatchery does not ship on the date promised, a poultryman is entirely within his rights to request the refund of his money. In such cases we feel that it is worth while to 'phone the hatchery and thus save

time. Poultrymen should consider the possibility that even with a week's delay he can get chicks earlier than he can by ordering from another hatchery.

That Extra Cent

"I received a letter from an egg buyer in New York City, soliciting my eggs and quoting the price of 33c for large and 28c for medium. I shipped them a case and received returns of 26c. The eggs were infertile, properly candled, graded on an egg scale sealed and approved by my county sealer of weights and measures. They were properly cooled and delivered to the railroad station. I returned the check and received it back saying there was no error but that the eggs were received warm and were not of good quality."

There you have the two sides of the story and you can use your own judgment as to which is correct. In our opinion price quotations such as this firm made mean nothing. They are made today; you get them tomorrow and by the time the eggs reach the city, the market may have dropped several cents. The receiver is not going to pay 33 or even 30 if the market is 27, therefore we wonder why a firm solicits eggs by quoting prices. We have no way of knowing the quality of the eggs when they arrived in New York but we do know that some firms solicit eggs on a price basis and then find some reason to return less than the price quoted. The right way to check on a receiver for your eggs is to investigate his financial and moral rating and then when you find a man who treats you fairly, stick with him. The poultryman who shifts from one receiver to another with the hope of getting an extra cent gets disappointed.

Selling — Not Buying

We are still receiving many letters asking about the Quality Dress Company of New York City. The letters indicate that our subscribers believe this concern offers to pay women for making dresses. Careful reading of their letters shows that the company sells cloth but that they make no definite promise of buying back the completed dresses. It appears that those who deal with them must find their own customers.

Sorry!

"I ordered a pop corn machine from a Mr. Crimmins, salesman for the Excel Manufacturing Corporation, on March 16, 1938. I paid \$10.00 down. As I did not receive the machine on May 1st as ordered, I wrote to the company, and also to Mr. Crimmins, but I did not get my refund nor any reply from him."

Up to date our efforts to secure the return of this refund have met with no success.

P. O.

North American Accident Insurance Co.
Savings Bank Building, Ithaca, N. Y.

—Photo is by Daily Kennebec Journal.

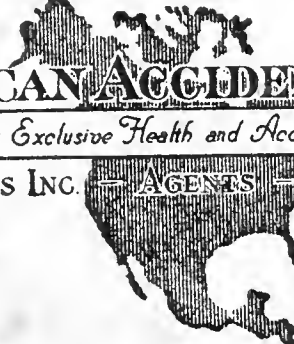

THIS IS A PICTURE of the wrecked car in which Edmund N. Butler of Waterville, Maine, was injured on November 10, 1938. In an automobile collision he received fractured vertebrae. On January 11 he was paid \$60.00 and on February 16, \$70.00, making a total of \$130.00, the full weekly benefit protection provided by the policy.

Mr. Butler wrote in saying, "I wish to express my appreciation for the \$130.00 which I have received from the North American Accident Insurance Company. It was indeed a great help to me and my family—the best investment I ever made."

Oldest and Largest Exclusive Health and Accident Company in America

N.A. ASSOCIATES INC. — AGENTS — POUGHKEEPSIE, N.Y.

Do you want to buy a ton of Lime and 300 pounds of Superphosphate for \$1.63?

Shown below are the programs of two farmers for seeding spring grains—one who has signed up with the Agricultural Conservation Program, and one who has not signed. The signer is able to accompany his seeding with a complete soil-building treatment at a net cost of \$1.63 per acre.

Figures used in these examples are average for New York State. They will vary slightly in New Jersey and Pennsylvania, but the general picture is the same throughout G.L.F. territory.

G.L.F. feels that these facts should be placed before its patrons so they can decide for themselves whether they wish to sign up.

In most cases the materials used for carrying out Agricultural Conservation practices can be financed by assigning the payment so that the cash outlay is kept at a minimum.

Non-Signer's Program

	Net Cost Per Acre
LIME: None	\$0.00
SUPERPHOSPHATE: None	0.00
MANURE: Figured at no cost	0.00
SEEDING: 8 lbs. Timothy 6 lbs. Med. Red Clover 4 lbs. Alsike	2.57
NON-SIGNER'S NET COST PER ACRE	2.57

Signer's Program

	Net Cost Per Acre
LIME: 1 ton	
Average cost delivered	\$4.50
Less A.C.P. payment	3.50 \$1.00
SUPERPHOSPHATE: 300 lbs. (20%)	
Average cost	3.00
Less A.C.P. payment	.87 2.13
SEEDING: 8 lbs. Timothy 6 lbs. Med. Red Clover 4 lbs. Alsike	2.57
Less A.C.P. payment	1.50 1.07
SIGNER'S NET COST PER ACRE	4.20
COST OF SEED ALONE	2.57

Net cost to Signer for 1 ton lime and 300 lbs. 20% superphosphate .. **\$1.63**

A DECORATION DAY EDITORIAL

by

E. R. EASTMAN

—PHOTO
BY EWING GALLOWAY, N. Y.

NATIONAL CEMETERY,
WINCHESTER, VIRGINIA.

*"No vision of the morrow's strife
The warrior's dream alarms,
No braying horn or screaming fife
At dawn shall call to arms."*

ON A SOFT summer day early in this month of May, son George and I left Washington to visit some of the Virginia Civil War battlefields, where my father spent four tempestuous years.

Virginia, a grand old state, has a lot of good land. The Shenandoah Valley, for example, is justly famous for its farms. But, like many other states, there are hundreds of square miles of waste land, much of which is swampy and covered with brush and woods. In this swampy, desolate country, which some general of the Civil War described as "filled with gloom like the shadow of death", were fought four of the bloodiest battles of the Civil War—Fredericksburg, Chancellorsville, the Wilderness Fights, and Spotsylvania Court House, all within a few miles of one another. In each of them the Federal forces were either defeated or brought to a standstill. Their only gain was in wearing down the dwindling Confederate forces.

My dad has been gone these thirty years, but not in life was he ever closer to me than he was as I walked with George, who much resembles him, through the Virginia woods on that summer day, and thought of him on those other May days when those woods were murky with the smoke of battle. As George and I stood on a long line of low breastworks

that the Confederates had erected at the battle of Fredericksburg, and are still clearly to be seen, I heard the song of a strange bird. George answered it with a similar whistle, and the bird responded as long as George would whistle. It was the mocking bird. Then I recalled Father's story about sitting on his horse on a picket line in the dead of night, far in advance of the main lines, with other pickets hardly even within calling distance 100 yards or more apart up and down the line. He used to tell about how scared he was at such times, when at any moment he expected to get a bullet through him from some lurking bush whacker! And if suddenly near at hand a whip-poor-will let loose his lonely call, Dad said it made him jump so he would nearly fall off his horse!

At Fredericksburg there is a steep mound or hill overlooking the town. On this hill the Confederates were entrenched. The Federal forces came down the hill from the other side of the valley, crossed the Rappahannock and charged the Confederates on this hill time and time again, but were driven back with tremendous loss. At the close of the war the United States took over this hill as part of a national park, and took 15,000 Union dead from the nearby battlefields and interred them in a national cemetery on this hill. The guard told

us that of those 15,000 Union boys, only 3,000 of them could be identified by name. The other 12,000 sleep in Dixie in unknown graves.

As we walked with reverent step down the greensward of this hilly place, I thought of the fathers and mothers of those boys, and of the thousands of other parents of both North and South whose boys went away to the Civil War, never to return. Never have I been in a place that represented more concentrated woe or sorrow! Think of the 12,000 mothers of those sons in (Turn to Page 19)

A Low Price for Milk makes

***All Business* run in Low Gear!**

Today business men in the rural communities are beginning to understand that **THEIR** prosperity depends on the **FARMER'S** prosperity. For when the farmers are getting a **LIVING PRICE FOR THEIR MILK** the effect is felt in every store and factory in the milkshed. Today, our business friends in the rural communities are helping all they can in this fight for farmers' rights.

The thousands of farmers who own, operate and control the Dairy-men's League together with all other organized farmers welcome this help. For twenty years the Dairy-men's League has fought this same fight — and always against the same Anti-farm Gang which is fighting the farmer today.

We honestly believe that a solution can soon be worked out. We feel that with the return of the State and Federal orders — with the control of the surplus back in the hands of united farmers, better prices and better times will return.

Today the farmers of this milkshed know that they must depend upon themselves; that no program can or will work without farmer support. More and more farmers are realizing that **ONLY** by the **ORGANIZED EFFORT** of farmers and their friends can dairymen use the legal rights the State and Federal orders will give us. So we urge — **LET'S STICK TOGETHER FOR OUR COMMON GOOD AND WE WILL SOON HAVE THE WHEELS OF PROSPERITY ROLLING.**

WAR with the CROWS

by ROMEYN BERRY

THE CROW is my enemy, but I rather like him.

The phenomenon of having an affectionate regard for the enemy growing out of respect for his courage, endurance and tactical skill, has been marked in combat troops through many wars and many centuries. Non-combatants achieve implacable hates which endure, fester and are handed down; but the line, in constant contact with the foe through endless weeks of fighting, frequently acquire something like affection for the fellow on the other side against whom their best efforts avail not at all.

It is that way with us in our war with the crows, which subsides by tacit agreement under the grip of every winter, only to burst out again into bloody conflict with the coming of each new spring.

The instincts, the dispositions, the national aspirations and the specific plans of the crows are incompatible with our own. Our farm belongs to us. We have the documentary evidence to sustain our title with full warranties of quiet enjoyment and with no exceptions or reservations with respect to aboriginal rights of the crows. As against that, the crows contend (with more plausibility than we care to admit) that they had ranged our land from time immemorial, had reduced it to possession long before we arrived on the scene, and have no present intention of yielding it to us on the mere exhibition of an abstract of title, the validity of which they have never recognized and will never admit.

There you have the familiar issue, and there the lofty purposes of the great crow war, to which both sides stand irrevocably committed and to which both have pledged their lives, their fortunes, and their sacred honor.

With no special animosities toward the crows, whose many admirable qualities we recognize, we aspire to cultivating our acres and to sustaining ourselves thereon through the work of our hands and the beneficence of the good earth. But the crows, on the other hand, have highly resolved to eat every green shoot that comes to the surface in response to our efforts, to the end that government by, of and for the crows shall not perish from the earth. He would be, I think, a supine lily-livered farmer who would not take weapons from the wall in answer to such a challenge, and in defense of his holding. Consequently, the coarse and raucous bugles of the mobilizing crows ring out from woodlot with the approach of the planting season, while the serenity of the spring is punctuated with the roar of our guns and the whine of rifle balls.

In the judgment of an impartial military observer, who accepted only the evidence of his eyes and ignored the official communiques of both sides, the war to date would be regarded as pretty much of a stand-off. With firearms and with poison we score casualties and occasional fatalities among the crows, while they on their side appear sleek, vigorous and of good morale on a diet of our newly sprouted grain, sauced with an occasional little chicken and now and then an egg. Once in a while we stage a successful ambush by shooting from the cover of the barn

over ground previously baited to lure the adversary into range. But such ambushes are tiresome to stage, they can never be successfully repeated and at best they yield but one or two dead crows.

We learn of good results achieved in the crow wars of the Middle West through the tactical use of dynamite let off at night in places where the foe roost thickly. But we don't seem to

have enough crows to justify such wholesale methods, and we have the uncomfortable feeling that the dynamite might not be sure which side it was fighting on, and might prove quite as unpleasant to our side as the other. Besides, too, and as I said at the beginning, we have too much regard for our valorous adversary, to employ against him unsportsmanlike tactics or new weapons not recognized as Kosher by such chivalrous captains as Frederick the Great, Napoleon Bonaparte, and Ulysses Simpson Grant.

After all, we wouldn't want to be too successful in our war with the crow. Honor requires that we battle annually, and self-interest dictates that we do not permit him to get too fresh. But we can't afford to be wholly without these handsome black pirates who

are our allies in minor skirmishes with the grubs, the cutworms and the field mice. I guess, too, the old farm is capable of taking care of a few crows along with the rest of us, and after all, one can't avoid a certain amount of admiration and liking for our adversary that gives blow for blow and consistently out-smarts us in one campaign after another.

One-Act Play Contest

Those who are competing in the one-act play contest sponsored by the *American Agriculturist* are urged to send in their scripts as soon as possible. The contest closes June 1st, and it will be impossible to consider scripts mailed after this date. A number of plays have already been entered. Send yours now!

**LOW PRICE..

**You Get All in the New
McCormick-Deering
6-FOOT COMBINE**

\$695

f.o.b. factory, complete for power-drive operation, with choice of grain tank or bagging platform. Machine complete with auxiliary engine, \$855 f.o.b. factory.

Everything you need and want in a small combine is built into the new McCormick-Deering No. 61 Harvester-Thresher—and with its low price of \$695 f.o.b. factory, this 6-foot machine gives you the *most value* in the combine market today.

Enjoy all the advantages of combining—the modern, low-cost method of harvesting and threshing all small grains and seed crops. Buy the McCormick-Deering No. 61. Ask the International Harvester dealer about it. You can purchase it on the Income Purchase Plan. Other McCormick-Deering Harvester-Threshers are available in sizes up to 16-foot cut.

INTERNATIONAL HARVESTER COMPANY
(INCORPORATED)

180 North Michigan Avenue

Chicago, Illinois

McCormick-Deering BINDERS...TWINE

If you are not in a position to change over to the combine method, the International Harvester dealer can offer the famous McCormick-Deering line of binders for horse and tractor operation. These are greatly improved binders in every respect.

One of their important features is the enclosed-gear construction. Sizes range from 6 to 10-ft. cut.

And when it comes to twine, there is none better than good, reliable McCormick-Deering "Big Ball" Twine—guaranteed for length, strength, and weight. Place your twine order with the dealer now and be sure of an ample supply at harvest.

ONLY THE McCORMICK-DEERING No. 61 GIVES YOU ALL OF THESE FEATURES IN A 6-FOOT COMBINE

- ① Patented open-end auger.
- ② Rub-bar cylinder. Does not chop straw. Simplifies separation and is easily adjusted.
- ③ Straight-line threshing. No right-angle turns or bottle-necks to cut capacity.
- ④ Extra-value construction.
- ⑤ Rotary, 3-section, all-metal straw rack.
- ⑥ Designed for engine operation as well as power drive.
- ⑦ Simple to operate and adjust.
- ⑧ Handles all small grains and seed crops.

Bitter Criticism Never Helps

A DAY or two ago a young lawyer, who has specialized in agricultural law in cooperative milk marketing, said to me:

"Ed, I think I have made a mistake in my life work. I took up cooperative law not only to make a living, which all of us have to do, but because I really felt that here was an opportunity to do something for farmers. Now it seems to me, however, after some years of experience with it, that feeling among farmers in the milk marketing business toward one another and toward their leaders is so intense, there is so much hatred and so little toleration that I feel I have made a mistake in my life work. I could have made a living and should have done more good in some other line of my profession, and had much less argument doing it."

"Furthermore, I am beginning to wonder if a class of people who disagree so violently among themselves can ever do much for themselves."

It seems to me that this lawyer has made a point that all of us interested in dairying from the producers' end should give some thought to. Of course we have made some progress in cooperation. There have been more dairymen working together during the last year than ever before. Leaders of the different cooperatives large and small came together in the bargaining agencies hating one another, and after acquaintance and better understanding came to respect and even like one another. But that good feeling does not apply, in all cases anyway, to farmers in different cooperative organizations.

It seems to me, therefore, that the next step in progress in better farm marketing is to gain more toleration, to stop thinking that the other fellow and the other fellow's leader is not to be trusted just because he doesn't belong to the same organizations that we do. I don't know what there is about milk, but ever since I can remember it has been almost a fighting word. I confess to my faults in this respect. Why is it that hardly any of us can talk about the subject without getting all heated up? Many of the statements that are made about milk marketing are based on misunderstanding and prejudice instead of on the real facts. *The chief result of this hard feeling among dairymen is starvation prices.* This policy of hatred has failed, so why not try something else?

The New York State Legislature passed the Nunan Bill by a large majority. It is confidently expected that the Supreme Court of the United States will uphold, possibly with some slight changes, the Federal milk marketing agreement. If so, it will be possible to restore the marketing agreements by the first of July or by the first of September at the latest. While these agreements are not perfect, most of us believe that they will help milk prices a lot. *Neither this plan of milk marketing nor any other can ever succeed for any time without the united support of dairymen.* But there never will be that support and general united teamwork until there is better understanding, appreciation, and toleration of one another. Next time you start to criticize, try saying something good instead.

A Good Place to Live

IF YOU don't believe that the Northeast is a beautiful land, you should have been with me on a trip from which I have just returned, from Ithaca to Boston.

How good it is to see the cows in the pastures again. As one rides across this greatest dairy section in the world, he is reminded of that fine old phrase,

"The cattle on a thousand hills".

He is impressed also with how farmers are mak-

ing every available minute count, getting in the crops. Although work was slow in getting under way on account of the late season, the dry weather of recent weeks is helping farmers rapidly to catch up.

But that same dry weather is not good for pasture and meadows. At this writing it is very dry, and getting worse, and unless the rains come soon there will be a big shortage in the hay crop. Any surplus left from last year's hay crop may look pretty good to farmers before the end of the next feeding season.

Famous Trees

THIS big birch, photographed by Nelson A. Jackson of the Northfield School at Mount Hermon, is about 31 miles north and east of the village of East Northfield, Massachusetts. So far as known, it is the biggest white birch in the world. The trunk is 18 feet in circumference, it is about 50 feet high, and the spread of the horizontal branches is about 90 feet.

Ordinarily, white birches are erect, straight and of moderate size, but this old tree, like an old old man, is bent and twisted by time. No one knows how old it is, but Mr. Jackson reports that a citizen of Northfield stated that he visited this tree over seventy years ago and the size then was the same as now.

To the beauty of the northeast countryside white birches have added much. *American Agriculturist* is interested in famous trees, and will pay \$5 for good photographs of famous trees which we can print. Each photograph should be accompanied by a brief history. All pictures will be returned after use, if desired. Address pictures to *American Agriculturist*, Department T, Savings Bank Building, Ithaca, N. Y.

Poultrymen's Opportunity

TO NORTHEASTERN farmers, the poultry business brings more income by far than any other farm enterprise except dairying. Also, this poultry income is not limited to those who specialize in poultry alone, for there is more or less poultry on nearly every farm.

That is the reason why nearly every farm family in the Northeast should be interested in the greatest gathering of poultry interests the world has ever seen at the World's Poultry Congress at Cleveland, Ohio, from July 28 to August 7.

For some reason or other, the poultry business has not had the place in the sun that its great importance deserves. It has had comparatively little publicity or advertising. The purpose of the World's Poultry Congress, is to publicize, advertise, promote and sell our great poultry and egg industry to the American people. The coming together of leaders and members of poultry organizations from all over the world will make a more closely united poultry industry, which will

work for permanent advancement in the future. After the World's Poultry Congress was held in Canada, it was found that the consumption of eggs took a big jump in that country.

What a splendid opportunity for both a vacation and a liberal education in your own business! If you are in the business at all, you cannot afford to miss this opportunity. If men from far countries can afford to travel thousands of miles to attend this Congress, you certainly can go hundreds. The whole enterprise is non-commercial. Any money left from the Congress after expenses are paid will be used in further educational work to boost the poultry industry. Now, here is a chance to boost your own business by:

1. Making plans to go.
2. Getting your neighbors to go.
3. Contributing at least one membership fee (\$1.00) whether you can go or not. Checks may be sent to L. Harris Hiscock, Skaneateles, N. Y., or to your State Chairman if you live in another state.

Cattle-Crossing Hazards

"During the summer, the cattle on this place have to be taken four times daily across an 'S' turn in a state highway which carries much through traffic. After sighting the cows, 200 feet is about the most a driver has in which to stop. We put up very conspicuous signs at 500 feet, but no one pays attention to them. The crossing takes only two to three minutes at the most, but what hair-raisers can happen in that short space of time!"—R.H.G., New York.

THIS raises a question that is a problem for thousands of dairymen. In New York State, cattle on the highways have to have someone with them, or else their owner is responsible for any accident. If, however, cattle are attended when crossing or traveling on the highway, the responsibility to exercise due caution is on the motorist. Unless the automobile driver can prove that he exercised caution, he is responsible for damages. In court, of course, there might be some argument as to what "due caution" was under the circumstances and also as to whether or not the cattle were properly attended. For example, if the herd is a large one, if it had to travel some distance on the highway, and if there was only one attendant, at least some of the burden of proof might be on the cattle owner.

Possibly we might be of help in securing some better legislation on this crossing situation. Is the legislation in your State sufficient so that it is fair to both the motorist and the farmer? We would be glad to have letters stating your experience and your views.

Eastman's Chestnut

IN THESE days of mounting taxes, one sometimes longs for the old times when we used to work out our road taxes under the direction of the pathmaster, who was a local farmer. The roads were not so good, but at least they did not cost much.

D. W. Phelps of Bridgewater, N. Y., tells the story of the farmers in a neighborhood starting out one morning to put the local road in shape. Among them was a fool, or at least he was so regarded, who started from the barn with a fine team of frisky young horses. His sister came out of the house and yelled at him to put those horses back in and take the staid old team. The fool refused, whereupon his sister said:

"You're nothing but a fool anyway."

"Yes," he replied, "I'm a fool and I know it, but you're a d— fool and don't know it!"

A Contest With \$60 in Cash Prizes

Test Your Knowledge of FARM EQUIPMENT

YANKEE ingenuity in inventing and developing farm equipment has been responsible for revolutionary changes in farming. The first result is that one man, with the aid of machinery, can produce far more than was ever dreamed of a century ago. It has removed from this land the prospect of famine which in ages past was ever before the rural population of many lands.

A second and indirect result is that it has made possible the development of this country into a vast industrial nation. In past centuries when farmers had to toil long hours to produce enough to feed the family, with a small but uncertain surplus to sell, most men had to be farmers. In this country the proportion of our total population living in cities has steadily increased, and the chief factor which made that possible was the development of farm machinery.

The third and important change is that farming is now a highly specialized industry which can be followed successfully only by the man who is trained for it. Not the least of the training needed is in the care, adjustment and repair of farm equipment.

Particularly in recent years, farmers have found it difficult to secure competent farm help and to pay the wages which such help demands. The natural result has been that farmers more and more have turned to labor-saving equipment, and this in many ways has encouraged the family-sized farm which many feel is the backbone of this country's agriculture. Because farm equipment is so important, we publish a good many articles about it each year.

To test your knowledge, and incidentally to have a bit of fun, you will find on this page the questions in our annual farm equipment contest. To add zest to the contest, we are offering cash prizes of \$25 for first, \$10 for second, \$5 for third, and twenty prizes of \$1 each.

On your farm are you making the most profitable use of your equipment? Is your farm under-equipped or over-equipped? Do you keep your machinery in repair and adjustment so that its useful life will be lengthened? Do you grasp every opportunity to become more familiar with the principles back of your farm equipment?

Here are the questions:

1. List and explain the ways in which gasoline tractor engines have been improved in order to increase power in proportion to the weight of the tractor.
2. What farm machinery company recently announced a new development in plow points? What is it?
3. Explain two methods of putting water in tractor tires to increase traction. How is freezing of this water prevented in winter?
4. What precautions should a farm owner take to insure a satisfactory electric wiring job for farm buildings?
5. Following are statements appearing in recent advertisements published in *American Agriculturist*. For each statement, name the advertiser and give the page number and issue in which the advertisement appeared.
 - a. The old days have gone when a bucket of axle grease and a squirt can of oil were the only lubricants needed.
 - b. Be ready to go when haying time comes around.
 - c. "Rob Peter to pay Paul."
 - d. A better tractor oil by the clock.
 - e. The test of a combine is its work in heavy crops.

- f. Happy heating at a new low cost.
 - g. For greatest economy in your farm operations, find out today how little it costs to put your farm on rubber.
 - h. You can do more work faster and save on fuel with high compression.
 - i. Safety approved by Wisconsin Industrial Commission.
6. What are the three operations needed in filing a hand-saw? In hand-saws, what is the fundamental difference between a cross-cut saw and a rip-saw?
 7. In what ways can farm machinery be used to help control weeds?
 8. Grain binder knotters troubles can usually be diagnosed by the condition of the band. What is wrong, and how can it be corrected, when you find the string with the bundle without a knot but with the ends twisted?
 9. What is the meaning of the term "high altitude pistons," and how are they used?
 10. What are the limitations of bank-run gravel for making concrete? How can these limitations be overcome?
 11. Some of the following statements are true; some are false. Label the ones that are true with a "T" and the ones that are false with an "F".
 - a. A 60-cycle electric motor will work equally well on a 25-cycle current.
 - b. A 10-gauge galvanized wire is smaller than a 14-gauge wire.
 - c. An electric transformer is a device to change the voltage of alternating current.
 - d. The draft of a walking plow and the ease of

A well equipped repair shop is essential on a modern farm.

handling it are affected by the length of the whiffletree.

- e. It is a waste of time to grind the discs on a disc harrow.
 - f. On a grain binder the way to get a tight bundle is to tighten up the adjustment on the twine tension.
 - g. In blasting ditches, dynamite is more effective in dry soil than it is in wet soil.
 - h. Under identical conditions, a 70 octane gasoline will knock less than a 60 octane gasoline.
 - i. A 1" four-strand rope is stronger than a 1" three-strand rope.
 - j. A gallon of good paint will cover with two coats from 300 to 500 square feet of surface.
12. List references read, including farm paper articles, books, bulletins, etc., in securing answers to these questions.

THE RULES

1. Contestants or members of the immediate family must operate a farm or have a home garden.
2. No member of a family connected directly or indirectly with *American Agriculturist* is eligible. Also ineligible to compete in this contest are teachers of vocational agriculture, county agricultural and 4-H club agents, members of state extension services or staffs of colleges of agriculture and persons connected with the manufacture or sale of farm machinery.
3. All entries must be postmarked not later than June 26. Address Farm Machinery Contest Editor, *American Agriculturist*, Box 367, Ithaca, N. Y. Winners will be announced in the July 8 issue.
4. Answer 10 questions, including Question 12.
5. Entries will be judged on (a) the amount of reference material read, including chapters in textbooks or other books on agriculture, bulletins, catalogs and pamphlets from *American Agriculturist* advertisers; (b) neatness and readability (write on one side of paper only); (c) brief, accurate, complete answers.
6. The editors of *American Agriculturist* will be the sole judges of the contest.

How to Answer Questions

Answers to some of these questions have within the last year appeared in *American Agriculturist*. If you keep copies, we suggest you look through them.

Other questions are answered in booklets furnished to our readers without cost by advertisers.

Many readers are building up reference libraries of books and bulletins on farm subjects. These are especially valuable if they are indexed or if bulletins in each subject are kept separate so that they can be easily located. Especially valuable are the instructions and repair guides put out by farm equipment manufacturers. Keep your copy, or get a new one if it has been lost, and refer to it frequently.

This is a good opportunity to bring up to date your bulletins on farm equipment. Write your State College of Agriculture for a list of available bulletins, and you can get the same information from the United States Department of Agriculture, Washington, D. C. Bulletins from your own State College or Experiment Station will be sent without cost. There is a charge, usually 5c a copy, for U.S.D.A. bulletins.

APPLE BILL says: "...Two 'O.B.' Products that fill the bill. One kills the worms young... and the other keeps the scab off."

ORCHARD BRAND ARSENATE OF LEAD

is establishing new records throughout the country for giving a greater degree of codling moth control... and higher Grade "A" packs.

It covers with thin, flake-like particles which tend to overlap... giving a smooth, continuous film which reduces bare spots to a new minimum.

ORCHARD BRAND MICRO-SPRAY+ SULFUR

... A Sulfur Fungicide of TRUE Microscopic Fineness! ...

has proven more effective than ordinary wettable sulfurs, because its finer particles expose a much greater sulfur surface. This means that more sulfur vapors are freed in a given period. These finer particles also give better filming and sticking.

Cheaper than lumber costs you, soft white pine. Also comb foundation. Large factory, selling direct, you save dealers discount. Quick shipments from stock, low freight rates, shipments arrive in 10 days. Free Catalogue.

WALTER T. KELLEY CO., Paducah, Ky.

A Fruit Grower's Slant on MARKETING

By HAROLD HITCHINGS,

Onondaga Co., New York.

CONSUMERS of apples in cities and urban centers seem unwilling to pay a price for fancy fruit, well graded, packaged and delivered, that would interest a grower in such a service. The bother of packing special varieties, special grades, mixed varieties, shipping by various agencies and sometimes poor collections outweigh the profits.

I think the advertising of cheap apples by stores and markets has a very bad effect on the price consciousness of consumers. They are led to believe that \$.89, \$.99, or \$1.19 per bu. at retail is all that apples should be worth. The people in our vicinity seem to think \$1.50 is an exorbitant price even for fancy Spies or McIntosh and \$2.00 is almost unheard of.

Anytime that we have to sell apples for less than \$1.00 per bu. out of cold storage, we figure we are working in the red. We are forced to sell some of our cheaper grades for less in order to move them, consequently we need considerably over one dollar per bu. for U. S. No. 1 apples if we are to make a profit. It is very discouraging to the grower to offer U. S. No. 1 apples to consumers who evidently have ample funds to pay for what they wish to eat for \$1.25 per bushel and have them insist on taking a bushel of Utility grade for \$1.10.

UNTIL it is possible to raise the price level of all commodities and especially food products, it is my opinion that we will have to grow and market our fruit at the lowest possible cost. I think for our own best interests that we should make the different grades carry as marked and that we should not have too many fancy apples in the U. S. No. 1 grade or too many No. 1 in the Utility grade. Fancy apples should be marked fancy. Of course there are always exceptions to this idea depending on the specific buyer or market.

It is becoming increasingly important that a grower be in position to make a grade to suit the buyer, but giving the buyer fancy apples for No. 1 grade makes him think he should always have better apples than the mark calls for. On the other hand, I believe in the terminal markets, especially New York, that the grade mark on the package means very little to the buyer as most fruit is purchased on appearance, and unmarked boxes to my knowledge sometimes outsell marked ones having the same quality fruit.

WE ARE primarily interested in net cash returned for the entire crop. Selling a few fancy apples for a high price does not always mean that the year's operation returns a profit. We could easily spend three or four thousand dollars more on our spraying, pruning and thinning program. It is rather questionable whether it will pay under present conditions to spend too much in order that we grow more fancy fruit. The trade wants a good apple but at a cheap price, and is not willing to buy a very high percentage of higher priced fruit. Of course we intend to grow all the fancy apples we can but we don't want to bankrupt ourselves doing it, at least not while we have government subsidy of other interests with no corresponding help for fruit growers.

It certainly doesn't make a grower feel very smart when he sells some cheap peddler a lot of apples which

anyone knows is junk. It does seem that some way could be found to use about 25% more of these cheaper grades in order that we might eliminate them from the fresh fruit market. A government subsidy, planned to use some of these lower grades, possibly buying a certain percentage from each grower at or near cost of production and processing them, would help the industry to maintain reasonable prices for the remainder of the crop.

MOST growers realize that it is a very difficult problem to control the sale of poor quality fruit. There are a large number of small orchards distributed throughout New York and surrounding states which are too small to make it economically possible to use a full spray schedule for control of insects and fungus diseases. The varieties are not the best, and fruit picked from many of these small farm orchards does not lend itself readily to first class packing operations. We necessarily will have in New York state for years to come a high percentage of undergrade fruit. The poorer apples are not good enough for a quality cider, as even this product for proper manufacture should have well matured fruit free from decay and an overabundance of insect injury.

We need more research to develop methods of manufacture of pectin, jellies, juice and dried products so that we can actually sell them for a reasonable profit. Geneva Experiment Station is doing a wonderful piece of work along this line though I wish they could have more money appropriated for their use rather than for new post office buildings, etc., which we could live along without for a while.

CERTAINLY if we have another large crop which is indicated by present condition of trees, we should be giving serious thought to finding some way to dispose of the surplus. The export deal does not appear too rosy. Increasing the consumption of fresh apples in the face of more citrus and other fresh fruit and produce is a rather slow process although there is much to be done in coordinating advertising and sales effort. It is very important that we hold our present markets.

The No. 1 fruit of popular varieties deserves better treatment from retail outlets. Growers should use the utmost care in placing fruit in retail stores in best possible condition in order that the retailer can handle it without loss. Retailers should cut profit margin in

CHARLES M. GARDNER
Editor of the National Grange
Monthly and High Priest of De-
meter of the National Grange.

AMONG the most commendable community service projects ever undertaken by Granges in the New England area has been the assistance during the past six months rendered to rural churches which suffered damage by the hurricane of last September. More than 200 churches were badly wrecked, many in communities where resources for making necessary repairs were exceedingly limited. Again and again the Grange has come to the rescue, staged money-raising projects which have added much to the church repair fund and have greatly cheered those who had the responsibility for church restoration.

WASHINGTON GRANGE in western Connecticut put on a lively feature recently. It was a milk judging contest, in which a large number of brothers were blindfolded, then given two cups of milk each, and required to guess by tasting which was the Guernsey and which the Holstein. In many instances the results were decidedly amusing to the audience, although somewhat embarrassing to the participants.

EASTON, No. 196, Massachusetts Grange, boasts of a lady member 94 years old, who still retains keen interest in all Grange affairs, though unable to attend meetings. In Ayer Grange, No. 300, in the same state, is a man 99 years old, a charter member and still present at nearly every meeting. Even with these remarkable age records, Massachusetts still had to take second place with Maine, by virtue of the continued activity of Charles H. George of South Paris, who will be 104 years old next September—undoubtedly the oldest Patron in the United States.

WHEN VERNON GRANGE, No. 228, in Vermont, celebrated its golden jubilee, it had two of the charter members who are still living. The completion of a half century of Grange life has been celebrated by recent repairs of extensive character on the Grange hall. A very loyal membership has always been a characteristic of Vernon Grange. Two of its best workers, Atherton Hale and Kenneth Newton, gave their lives in the World War, dying at Coblenz, Germany.

FRANK P. WILLITS of Ward, treasurer of the Pennsylvania State Grange, has just resigned owing to advanced age. The executive committee has named Philip Price of Chester County to the position. Mr. Willits, now above the 80-year mark, has been one of the war-horses in Pennsylvania Grange work for a lifetime and his service as treasurer has been of highly efficient character.

FOR THE second time within a short period, a Maine Grange has lost its hall by fire, including nearly all the Grange paraphernalia, furniture and equipment—this time at Surry in Hancock County. The loss will exceed \$5,000, but already active work is under way, looking toward the construction of a new home during the present season.

THE SERIES of instruction schools for Grange officers in Connecticut, held during the past two months, resulted in an aggregate attendance of 2,008 workers. New London County Pomona, No. 6, produced the largest attendance, 259. Some Granges sent every officer to the conference. Included in the total attendance 1306

were 1939 officers in some station, either subordinate or Pomona; while of these 130 were Grange masters and 96 were lecturers.

ONE OF THE outstanding "100% Grange families" in New York State lives in Ontario County. Its members are all affiliated with the Naples Grange group. Lloyd Harter is master of Naples Grange. His eldest son, Julian, is master of the Juvenile unit. Another son, Carl, is Juvenile overseer, and a daughter, Aliene, is Juvenile Pomona. Mrs. Harter is pianist in the subordinate Grange and is a Silver Star member of the Order.

THE NEWEST Grange reported from the New England group is Weymouth, No. 565, at Thomaston, Maine. Deputy Fred F. Maxcey of Thomaston was the organizer.

BARGAIN TOWN GRANGE, No. 203, in New Jersey, is very proud of the fact that one of its members is Congressman Walter S. Jeffries.

THE VACANCY in the office of treasurer of the National Grange, caused by the death of former Governor Robert P. Robinson of Delaware, has been

filled for the remainder of the year by the appointment of Mrs. Robinson. Choice of a new treasurer will be made at the Peoria session of the National Grange next November.

IMPROVEMENT with a capital I is the word these days in Jeremiah Smith Grange at Lee, New Hampshire, where all sorts of betterment projects in the Grange hall have been carried out. Electric lights have been installed, the interior walls and woodwork redecorated, a new clock, several articles of kitchen equipment, and improvements in the dining-hall are among the projects for which the members have been working mighty hard ever since the beginning of the year. In consequence their hall is a meeting-place to be proud of and increased attendance at meetings is the natural result.

A Fruit Grower's Slant

(Continued from opposite page)

many cases for more speed in movement and larger volume sales.

We cannot expect to sell all of our apples for a high price under present conditions because the low income group could not afford to buy apples

COMPENSATIONS

By Emily R. Estey

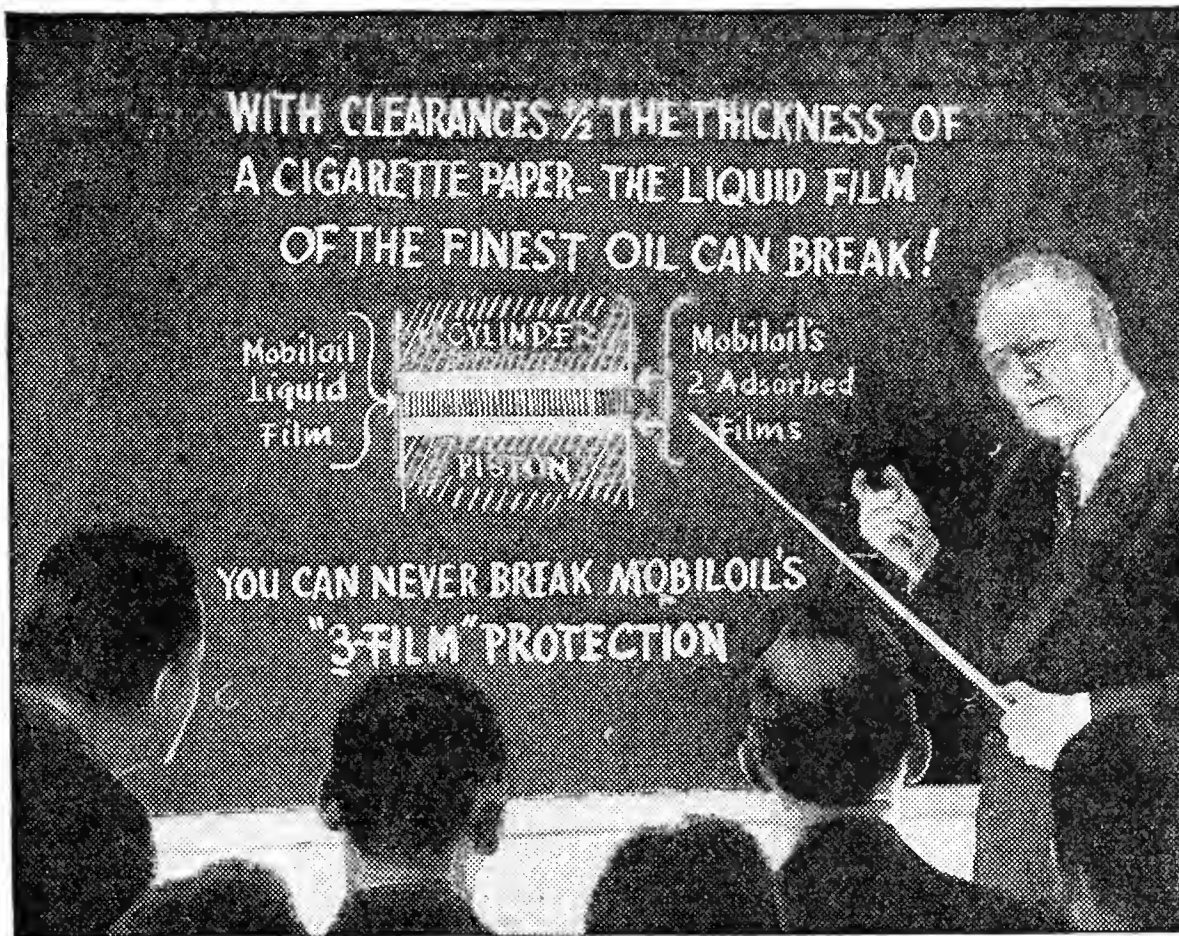

Farm life is a hard life
As none knows more than I.
(But I have seen the filigree
Of trees against the sky.)

Yes, there is always work to do,
And many cares that weigh,
(But we are the selected few
To see the birth of day.)

And earthy hands that delving find
The weed roots from the rows' great
length,
Folded may mean a humble mind
Asking their Father yet for strength.

at all if the price was raised very much. We need to grow varieties which produce a high percentage of No. 1 grade on young trees if possible as it is cheaper and easier to handle younger orchards. The older trees and unprofitable varieties should be eliminated. Our main hope for the future is to raise our average net return. This is imperative if we stay in business, keep our buildings and machines in repair, and carry on.

Mobiloil's "3 Films" Give 3 Savings

In Car, Truck, Tractor,
Mobiloil Helps Save:

- ① Repairs
- ② Depreciation
- ③ Costly Delays

HERE'S a "saying" to remember, "3 films are better than one." Mobiloil has special "adsorbed" films which cling to metal—can't rupture—insure extra protection from wear.

But that's not all. Mobiloil is made to give "Balanced Protection"—resists wear, gum, carbon, "oil drag." You get all good oil qualities, not just one or two! Socony-Vacuum Oil Co., Inc.

MOBILLOIL

A GOOD MAN TO KNOW

Your Mobiloil-Mobilgas
Man Has a Complete
Line of Money-Saving
Farm Products!

MOBILLOIL—gives "Balanced Protection." All good oil qualities—not just one or two.

MOBILGAS—delivers "Balanced Performance." A scientific blend of every good gasoline quality.

POWER FUEL—special tractor fuel. Smooth, even-burning, powerful, economical.

MOBILGREASE NO. 2—the all-purpose farm grease. "Half as much lasts twice as long."

MOBILLOIL GEAR OILS—all grades. Highest quality.

KEROSENE—pure, clean-burning. Refined by experts.

WHITE GASOLINE—Finest quality! Clear-burning in gasoline appliances.

BUG-A-BOO—kills insects quickly, surely. Stainless.

SANILAC CATTLE SPRAY—won't irritate eyes or hide. Effective all day long.

He has lower-priced lubricants also—made by the makers of Mobiloil—economical for equipment whose age or condition does not justify the highest grade.

HEAVY-DUTY FANS NEED
MOBILGREASE NO. 2

Proper lubrication is vitally important here. Use Mobilgrease No. 2. It keeps heavy-duty fans running smoothly, efficiently...it gives them complete protection.

JAMES S. MORSE

LEVANNA, NEW YORK

DOWN THE

By J. F. (DOC) ROBERTS

SO MUCH interest is being shown in the Northeast to help the dairy industry by substituting at least a few beef cattle for dairy cows that I am going to jot down a few ways and means.

First, if you want to produce choice steer beef, buy in the fall 300 to 400 lb. choice calves. After acclimating them on grass, put on silage, hay, and, by all means, not less than one pound per head per day of protein supplement, with some oats, barley or corn. Graze the next season until the grass gets dry, hard or frost-bitten then put on full feed silage, 1 1/2 to 2 pounds of protein, and 6 pounds of corn per day for about five months. Then step up the corn until getting 12 to 15 pounds, and keep them on this daily feed until fat, which generally means about eight months from the time taken off grass in the early fall. Remember, this is only for strictly choice Hereford or Angus steer calves.

Choice heifer calves, bought in the fall, should not be fed through the winter and grazed the next season, unless they were bought for breeding purposes. It seldom pays to carry choice beef heifers past the yearling age, as they take on cow shape, whether bred or not, and lose attraction for beef purposes. Heifers have the advantage of reacting to their feed much faster than a steer for the first six months of their feeding period. Therefore, they should go on a full feed of roughage and grain in the fall, fed five or six months, and marketed within 30 days of the time they are fat, regardless of the market, or they will become gloomy fat, and again not attractive to packer-buyers. From a spring marketing standpoint, if properly handled, heifers are one of the most desirable cattle operations in the East. Again, this operation only applies to choice quality beef heifers.

Secondly, you can buy medium-to-good red and roan, 300 to 400 lb. calves in the fall, then after acclimating on grass, put on full feed of silage, concentrate, good hay and some grain, but not nearly as much as with choice cattle, and sell in the early spring as butcher cattle, in a little better flesh than a good cow. Without quality to start with, do not try to make quality. Simply feed for gain in weight and a smooth finish. If you have abundant

pasture, or a grazing problem, you can winter this same class of medium-to-good calves, with less grain, turn out the following spring, bring them in early in the fall, grain feed until late in November or December, and market them, not trying to carry this kind through a long fattening period. If you buy a few more calves this next fall, you can carry on, year in and year out, with only a short period when you are carrying both years' cattle.

One of the safest beef cattle operations is to buy some choice Hereford or Angus heifer calves in the fall, or possibly in the spring, and carry them on good feed until they are at least two years old, so that they will get lots of growth, size and flesh, and then breed to a really good beef bull. You must have excellent foundation stock for this operation, but not necessarily pure-bred. The bull and the growth and size of cows will spell success or failure in this operation. If these calf heifers are properly grown, the cow will give you four or five calves and still bring enough to pay for herself as beef.

Lots of interest is being expressed in breeding a good Angus bull (because they usually produce black calves) to our good, big, dairy cows. If this is to be a success, the calf must nurse the cow, and it must never lose this milk fat; and when weighing about 400 lbs., it should still be on milk and grain, and then full-fed grain until weighing 650 or 700 lbs. and sold as beef right then. This cross-breeding promotes rapid growth, but if the calf is allowed to lose its milk fat and grazed, or just fed roughage, you will get a rough animal no greater in value than a straight Holstein cross, for example.

You will note that in practically every case you should buy in the fall, not in the spring, the reason being that the range country can use cattle in the spring but is forced to market them in the fall, as it hasn't the winter feed. Bob Martin, to whom I am indebted for a large part of this, tells me that this spring is no exception, and that all classes of stocker and feeder cattle are selling very high, with every prospect that again this fall they will not only be cheaper, but that the kind you want will be available. Do not buy range cattle, except through reputable or licensed dealers or commission men.

Buffalo has been selling Canadian cattle at the rate of over 100 carloads a week since April 1, but it is anticipated that the Trade Treaty allotment will be filled within a week, which means no more Canadian cattle until July 1st.

from SKEFF'S NOTEBOOK

By L. B.
SKEFFINGTON

ANNOUNCEMENT has just been made that the State Grange will hold its annual meeting in Syracuse the second week in December. The National Grange is to meet a month earlier in Peoria, Ill.

Letters About Milk

Recently I expressed myself about milk, although I suppose the subject should be taboo. I was aware that Ed Babcock once said there was no sense in arguing about milk or religion. But after summarizing the results of meetings I attended, of various referendums, and of my own observations, I suggested that restoration of the provisions of the Rogers-Allen law seemed about the only immediate hope.

That brought a flock of letters, a number of them quite abusive. That is OK with me. I would rather men say what they think frankly. Nothing of that sort ever offends me. One of my good friends is a man I never knew until he wrote me a blistering letter a couple of years ago.

Maybe I am just plain dumb, and maybe I am incapable of seeing the point, but I am unable to see that any plan is offered in place of the state-federal marketing agreement. It seems to me there are only two courses: First, let nature and the economic law take their course; second, interject some man-made plan to hold up price levels temporarily. The first plan might be best in the long run, but some farmers would be called upon to pay a terrible price. The sensible plan seems to be to do something which will give farmers a break. Admitting the Marketing agreement may not have been perfect, what, if anything, has been offered in its place?

Spring Work Late

In upstate New York pastures are green and lush due to the long rainy season. Bloom is about even with a year ago, but farm work in general is 10 days late. During the time when farmers like to get oats in the ground it was raining. Now that many of the early crops have been sown there is at this writing need for rain. Sunday I noticed plowing and fitting operations in sections where normally Sunday work is frowned upon and on the previous Sunday the air was full of lime-

Nominate a Master Farmer

THE FIRST New York State Master Farmers were named in 1928. At present there are 87 living, and 6 who have died since the honor was given them. As you doubtless know, Master Farmers are chosen for their success as farmers, for their contributions to community betterment, and for the thought and attention they have given in building a real home and in educating their children.

If you know a farmer who stands unusually high in these requirements, we would be glad to have you nominate him for consideration as a Master Farmer for 1939. All you need to do is drop us a letter saying, "I nominate _____ as a Master Farmer," sign your name, and send to *American Agriculturist*, Box 367, Ithaca, N. Y. If you have nominated a man in the past who has not been named and who you still feel is a logical candidate, nominate him again. A man is always eligible. It is well to remember, however, that few men are named for the honor before they are fifty.

sulphur as spray rigs pumped. This merely emphasizes that the farmer and his crops are at the mercy of wind and weather and Sunday work reminds that the season has not been a normal one.

Should Farm Research Be Cut?

Most farmers I have met appear to be in sympathy with cuts in public expenditures, to reduce taxation. A number, however, have told me they are doubtful about cutting research funds. I was reminded of this when I saw an ear of pink corn apparently enclosed in a solid block of glass on the desk of M. L. Wilson, Undersecretary of Agriculture. It was a new plastic material made in the USDA laboratories from molasses. Just one more step toward utilizing farm products. Farm research is cheap.

Open Cherry Ad Campaign

A campaign is under way to sign up growers of sour cherries on an advertising and promotional campaign. Growers are asked to agree to a deduction of one-eighth of a cent per pound. I know many cherry growers will object to parting with part of the returns they receive for the crop. I also know that unless something is done to popularize red sour cherries it might be just as well to pull up a lot of trees.

Today sour cherries are not sold in stores in competition with other fruits because so few people ask for them. Last year a couple of growers I know made a store to store survey, including about 60 stores, and in general found that more canned sour cherries were sold during February than during any other month of the year. This was attributed by store clerks and managers to the publicity given to cherries around Washington's birthday. This

seems to indicate that advertising effort may be expected to sell cherries, and if they cannot be sold why raise them?

Apple growers who have informed themselves know their promotional work through the Apple Institute has been successful and effective; there is no reason why it should be otherwise with cherries. The only mistake that growers may make is to expect too much in one season. To promote into active consumption a product with very little sales appeal—such as sour cherries—is a hard job and cannot be done overnight or without funds.

Uniform Containers

The USDA again is urging standardization of containers. Northeastern apple growers have talked and conferred and adopted rules, but in reality little has been done to standardize the box. There are too many shapes and sizes and a bushel box means anything from a bushel to a bushel and one-fifth. The box was designed to eliminate the bulge pack in bushel baskets and now the box is being bulged, resulting, particularly during the past season, in wide complaint about bruised apples. As long as the bulge pack is continued bruising may be expected. Yet most packers are afraid they cannot sell their fruit unless they give a fifth extra with every bushel. It is true that one of the arguments is that after fruit has been in storage for months there is heavy shrinkage, but still the situation is all wrong.

And, of course, equally cockeyed is New York's ruling about open and closed packages. A box with the paper liners turned over and three slats nailed on, so that the contents are not visible, is called an open package to escape compliance with grading laws. Many of my friends among the fruit growers tell me this is nothing more than deception. Certainly there ought to be uniformity and clarity on all of these points.

I Visit Virginia

Recently I made a trip down through Pennsylvania and into Virginia, thence over to Washington. The season down there was all of two weeks ahead of upstate New York. In Virginia I talked with a number of apple growers and also with men in the extension service, and found they all expect a larger crop of apples than a year ago. I checked this in West Virginia and

Frank Jones, Supervising Inspector of the New York State Department of Agriculture and Markets. He has been an efficient worker in the New York State Department of Agriculture for many years, and at present his time is devoted to enforcement of the egg law.

found the same story. Whereas last year the crop was limited to the commercial orchards, this year every farm orchard appears all set to bear a good crop.

As the frost danger line has been passed down there, it is not expected this picture will change too much, although anything may happen before harvest time. In the Virginias it is recognized that one of the big outlets for apples is in by-products. Last year all of the big plants loaded up with apple sauce so there appears to be some doubt as to what will happen this year. I heard a good deal about apple juice down there and in general found it inferior to some of the better grades of New York juice.

N. Y. State Consignment Sale of Jerseys, Geneva, June 3

THIS SALE is a Jersey sale and only quality Jersey cows are allowed to enter the sale. Every cow entering the sale must be capable of classifying good plus or better, from a disease free herd with production equivalent to Register of Merit requirements and every animal is a guaranteed breeder. Some bred heifers have been entered and they will all freshen within four months after sale date.

The purpose of this sale is to establish an annual sale of quality Jersey cows which will allow the breeders of New York State to share their best animals with other breeders and interest new breeders. Each year there will be some other activity connected with the sale. This year the Jersey herd at the Geneva Agricultural Experiment Station will be officially classified at ten A. M. (EST), lunch will be served on the grounds and this day will be called the New York State Jersey field day and first annual consignment sale. Catalogues for the sale may be obtained by writing Dr. A. C. Dahlberg, Geneva Exp. Station.

Aberdeen Angus Sale

The third annual Eastern States Aberdeen Angus Sale held at Ithaca, May 8, was an extremely satisfactory event. Six bulls averaged to bring \$387.50, and 47 cows averaged to bring \$252.44.

Top price for bulls, \$700, was paid by Adams & Clark of Norwich, Chenango County, N. Y., for Sunset Permit No. 534506, owned by Laurel Hill Farm, Blandford, Mass. He was born May 4, 1937. Laurel Hill Farm is owned by George D. Fowler, and managed by John Lathrop.

Top price for cows was paid by William Mennen of Hideaway Farm, Chester, N. J. Mr. Mennen paid \$600 for Briarcliff Black Cap 76, No. 528944. The cow was born June 1, 1937. Briarcliff Farms is owned by Oakleigh Thorne, and managed by Samuel H. Morrison.

Grange Bread Baking Contest News

First Winners and Prizes

HOMEMADE bread at 25c to 40c a loaf! That's the report from Jewett Grange of Greene County, the first Subordinate Grange to hold its bread baking contest and to report to this office. Twelve Grange members baked bread for the contest, which was won by Mrs. Claude Conine of Prattsville, N. Y.

Mrs. John Planck, chairman of Jewett Grange's Service and Hospitality Committee, writes that the bread was auctioned off to the highest bidder and the money used toward the Grange Revolving Scholarship Fund. "The first prize loaf," says Mrs. Planck, "brought 40c, a few brought 35c each, and none sold for less than 25c. We made \$3.40 from 12 loaves of bread." We'll bet it was first-class bread, too!

Five other Subordinate Granges have held their contests. Here is a complete list of winners to date:

COUNTY	GRANGE	WINNER
Chautauqua	South Harmony	Mrs. A. L. Richardson
Greene	Jewett	Mrs. Claude Conine
Jefferson	Watertown	Mrs. William J. Cole
Orange	Balmville	Mrs. William Burrows
Steuben	Wheeler	Mrs. Walter Pierce
Tioga	Halsey Valley	Mrs. Harry Amoreaux

State and Pomona Prizes

We are now ready to announce all of the cash and merchandise prizes which will be awarded to Pomona and State contest winners by *American Agriculturist* and our advertisers. Here they are:

From *American Agriculturist*:

To State winners: First prize, \$25; second, \$10; third, \$5; fourth, \$3; fifth, \$2; and \$1 each to next fifteen highest winners.

From Cooperative G.L.F. Products, Inc., Ithaca, N. Y.:

To each of 10 highest State winners: 20-lb. pkg. G.L.F. Quality Patent Flour; 5-lb. pkg. G.L.F. Self-Rising Pastry Flour; 5-lb. pkg. G.L.F. Golden Blend Flour; 5-lb. pkg. G.L.F. Whole Wheat Flour; 5-lb. pkg. G.L.F. Graham Flour; 5-lb. pkg. G.L.F. Golden Corn meal; 5-lb. pkg. G.L.F. 50-50 Rolled Wheat and Oats; 1 No. 2½ can G.L.F. Old Jug Molasses (Gold Label).

To Pomona winners: 55 5-lb. pkgs. G.L.F. Quality Patent Flour; 55 5-lb. pkgs. G.L.F. Self-Rising Pastry Flour; 55 2-lb. pkgs. G.L.F. Golden Blend Flour; 55 2-lb. pkgs. G.L.F. Golden Corn Meal; 55 5-lb. pkgs. G.L.F. Graham Flour; 55 2-lb. pkgs. G.L.F. 50-50 Rolled Wheat and Oats; 55 No. 2½ cans G.L.F. Old Jug Molasses (Blue Label).

From International Salt Co., Scranton, Penna.:

To each of 10 highest State winners: one 10 lb. can of Meat Salt and butcher knife.

To Pomona winners: 110 packages of Sterling Salt and 55 3-oz. pkgs. of Seasoning.

From Kalamazoo Stove & Furnace Co., Kalamazoo, Michigan:

A Governor Coal and Wood Range to State winner.

From Pillsbury Flour Mills Co., Minneapolis, Minn.:

To each of 10 highest State winners: 1 24½-lb. sack of Pillsbury's Best Flour and one 2¾ lb. box Pillsbury's Snow Sheen Cake Flour.

To Pomona winners: 55 24½-lb. sacks of Pillsbury's Best Flour.

From Russell-Miller Milling Co., Minneapolis, Minn.:

To each of the 10 highest State winners: one 24½-lb. sack of Occident Flour.

To Pomona winners: 55 24½-lb. sacks of Occident Flour.

Evaporated Milk

PART II.

By LELAND SPENCER

IN THE previous article, we called attention to the fact that the consumption of evaporated milk has increased rapidly in the past 20 years, while the consumption of fresh milk is practically the same now as it was 20 years ago. The obvious reason why many families are using evaporated milk in place of fresh milk is the saving in price.

Leland Spencer

Now, why is it that evaporated milk can be sold to consumers for less than the equivalent amount of fresh milk? One reason is that manufacturers of evaporated milk pay the farmers less than fluid milk dealers pay. Last year, for example, the average price for Class 1 milk in the New York milk shed was \$2.20 per hundredweight. The condensery price was only \$1.25. The difference was \$.95 per hundredweight, or 2 cents a quart.

This comparison is made by taking a straight average of the prices for 12 months. Actually the evaporated milk manufacturer had more advantage than this because he packed most of his product during the spring and summer, when milk was cheap. About 60 per cent of the evaporated milk made in New York State is packed in April, May and June. On the other hand, only one-fourth of the milk for fluid use is purchased in those low-price months. Nearly an equal amount is purchased in November, December, and January, when prices are much higher.

The prices paid for milk at evaporating plants in this milk shed are based directly upon the price paid at similar plants in Wisconsin and other mid-western states. Under the Federal and State Orders that were used here from September through January last, the evaporated milk manufacturers in New York were required to pay only 10 cents per hundredweight more than the mid-western condensery price. Evaporating plants get their milk cheap because they can operate in localities where the costs of producing milk are low, because the dairymen do not have to comply with expensive Board of Health regulations, and because these plants can take in the major part of their supply while the cows are on pasture. Winter production is not necessary because evaporated milk can be easily and cheaply stored.

The spread between the farm price and the retail price also is less for evaporated milk than for fresh milk. Last year the difference between the price paid for 100 pounds of milk at condenseries in the New York milk shed and the retail value of evaporated milk made from it was \$2.26. The spread between the Class 1 price and the doorstep price of fresh milk was \$3.81. The difference in spread was \$1.55 per hundredweight, or more than 3 cents a quart. Of course, most of the evaporated milk is purchased cash-carry at the grocery store. Therefore, it may be better to compare the spreads on evaporated milk with that on fresh milk sold out of stores. Most of the fresh milk sold out of stores was purchased by the dealers at the Sheffield blended price, or very close to that. The spread between that price and the retail price at stores in New York City averaged \$2.57 per hundredweight. This was \$.31 more than the spread on milk which was evaporated and distributed in cans.

The spread on evaporated milk would be greater if allowance were

Over 90% Want Federal Order Restored

ON PAGE 5 of the last issue we promised a further report on the results of the question "Do you want the Federal-State Agreement reinstated?" There really isn't much more to report.

The proportion of questionnaires answering "yes" which came in after the results were given were approximately the same as were previous replies.

A few, approximately 2 per cent, of those who returned questionnaires did not answer the question definitely, but figuring returns on the basis of those who did answer definitely "yes" or "no", results were as follows: yes—93.5 plus per cent; no—6.4 plus per cent.

made for the larger purchases in those months when prices are low. Even so, it is evident that only the cheapest methods of distributing fresh milk will compare favorably in cost with the usual method of distributing evaporated milk. Assuming that the evaporated milk manufacturer pays \$1.10 per hundredweight for milk, processes it at a cost of \$1.00, and puts the canned product into a store where it sells at 6 cents a can or \$2.95 per 100 pounds of milk equivalent, the whole job must be done with great efficiency.

If New York dairymen are to hold their own in competition with the producers of evaporated milk, two things will have to be watched most carefully. In the first place, the prices for Class 1 milk should be kept in reasonable relationship to the prices paid by condenseries. In the second place, every effort should be made to get fresh milk to consumers at the least possible cost for marketing services.

Milk Prices

The net pool price for April as announced by Dairymen's League is \$1.05 for grade B 3.5 milk in the 201-210 mile zone. The price includes an average differential of 6c.

Following are reported as class prices for 3.5 milk in the 201-210 freight zone as used by a majority of New York dealers in computing returns to producers:

Class	Price per cwt.	Per point butterfat differential
I	\$1.45	.04
II-A	1.20	.04
II-B	1.20	.04
III-A	1.175	.034
III-B	1.003	.04
III-C	.903	.04
III-D	.878	.04
IV-A	.803	.023
IV-B	.845	.021

Retail Price Cutting

In New York City the retail price for grade B milk delivered on the doorstep is 11½c. Usually advertised brands of milk sell at stores for a cent less and unadvertised brands for 2 cents less.

The reduction in established retail prices which went into effect when the milk marketing order went out by no means eliminated price cutting. The average price of milk in stores is about 7 cents but some New York City stores have big posters in their windows advertising grade B milk at 5c and even as low as 4c a quart. Other stores offer a quart of grade B milk for 3c on the condition that the purchaser also buy a dozen eggs. Still others offer milk at 2c a quart if you will buy a loaf of bread, and at least one store offered a quart of milk free with each \$1 purchase. Dealers were able to buy milk as low as \$1.20 a can, delivered to their city plants.

A surplus control plan such as that

contained in the Federal-State marketing order makes it possible for this milk to be manufactured back in the country, at the same time allowing that producer to benefit by the maintenance of reasonable retail prices in New York City.

Comparing Milk Prices

The New York State Department of Agriculture and Markets publishes average milk prices by months as reported to them by dairy farmers. These prices indicate plainly the effect of the Federal-State marketing order last September. Study these figures:

	August	September
1937	\$1.94	\$2.11
1938	1.49	2.00

In 1937 farmers averaged to receive 17c more for September milk than they did for August. In September 1938, when the milk marketing order went into effect, they received 51c more than they did for August milk. That increase of 51c was the largest increase of September milk over August since these figures were started in 1933.

These figures should be of interest to those who argue that they received less when the order was in effect than they did a year ago. In August 1938, without the order, they received 45c less than they did in August the year previous. In September, when practically all farm products were bringing less than they did a year ago, they received 11c less. Also consider these figures:

	February	March
1938	\$2.07	\$1.84
1939	1.92	1.49

A year ago in these months the Metropolitan Bargaining Agency was able to maintain prices. Then farmers received 23c less for March than they did for February. This year they received 43c less. In February this year they received 15c a hundred less than in February a year ago. In March they received 35c less, and when April figures are available, it is expected the difference will be still greater.

Egg Consumption Good

On May 1 storage holdings of eggs were about 100,000 cases ahead of a year ago, but apparently this increase is causing no particular concern in the market. An optimistic factor is continued good consumption, partially due to advertising drive put on by stores.

April was the second consecutive month when baby chick hatchings were larger than for the same month a year ago. On May 1 advance orders for baby chicks were 19 per cent higher than a year ago. The biggest increases in hatchings were in the Pacific Coast States, the Mountain States, South Atlantic States, and New England States.

The egg-feed ratio for the week of May 12 was 9.3. A year ago it took 8 doz. eggs to buy 100 lbs. of feed, and two years ago 11.7.

During April a report from 84 hatcheries showed 55 per cent more turkey poults hatched than a year ago, and 46 per cent more eggs set. Advance orders for turkey poults on May 1 for these same hatcheries were 56

per cent higher than a year ago.

Winter Wheat—Estimated New York State crop of winter wheat is 5,098,000 bushels, compared with 7,425,000 bushels last year and a 10-year average of 5,049,000. Little abandonment of acreage is indicated, but at this writing wheat needs rain. The U. S. estimate is 543,928,000 bushels, compared with last year's crop of 686,637,000 and a 10-year average of 560,160,000.

Dr. Naylor's MEDICATED Teat Dilators

Safe and dependable treatment for Spider Teat, Scab Teats, Cut and Bruised Teats, Obstructions.

Dr. Naylor Dilators are sterilized, medicated and saturated with the antiseptic ointment in which they are packed. They have a deep yielding surface of soft absorbent texture which fits either large or small teats without overstretching or tearing and which carries the medication INTO teat canal to seat of trouble.

The Only Soft Surface Dilators

Easy to Insert—Stay in the Teat

Whether infection at end of teat, cut or bruised, the resulting condition which closes teat canal making it hard to milk is always the same—INFLAMMATION.

To relieve inflammation in a wound or bruise the treatment most universally used by the veterinary and medical profession is—to apply antiseptics, healing agents and a sterilized, soft absorbent dressing.

Dr. Naylor's Medicated Teat Dilators apply this same treatment for removing inflammation from the milk canal of cows' teats. They carry antiseptics and healing agents into teat canal to combat infection and promote healing. The dilators themselves are sterilized, soft, absorbent dressings which protect the inflamed area, absorb inflammatory exudates and keep teat canal open in its natural shape while tissues heal.

Sterilized, Medicated—
Packed in Antiseptic Ointment
Large Pkg. (48 Dilators) \$1.00
Trial Pkg. (18 Dilators) .50

CATTLE

National HOLSTEIN SALE

Saturday, JUNE 3rd
EARLVILLE, N. Y.

75 selected tops from 50 top-flight herds of U. S. and Canada. Cows with records up to 959 lbs. fat, drafted for both type and production—Choice Heifers—Show and Record Prospects.

Herd sires, both proved and prospective. Several from dams with over 1000 lbs. fat, including one from Carnation and the son of the World's Champion on twice-a-day milking with two records above 1000 lbs. fat.

Sensational show herd material for next fall, selected by a nationally known showman.

All animals negative on blood test, largely from Certified herds—all accredited for T.B. Mastitis charts on all milking animals.

An established, reliable market place. Earlvile is located 30 miles from Utica—40 miles from Syracuse—good highways in all directions.

Now is the time to buy quality Holsteins and here is your best opportunity. For further details, write

Pea Pickers Exempted from Wage-Hour Law

PEA PICKERS, whether employed by a farmer or by a canner, are exempted from wage and hour provisions of Fair Labor Standards Act, according to advice received this month from Washington by Commissioner Holton V. Noyes of New York State Department of Agriculture. Department had raised question recently with Federal Labor Department and received following ruling from Washington:

"Section 13 (a) (6) of the Act exempts from both the wage and hour provisions any employee employed in agriculture. Section 3 (f) defines agriculture as including 'the production, cultivation, growing and harvesting of any agricultural or horticultural commodities.'

"It is our opinion that persons employed to pick peas are engaged in 'agriculture' within the meaning of the Act and are, therefore, exempted from both its wage and hour provisions, whether their employer is the farmer on whose land the peas are grown or is a canning company which has contracted to buy those peas."

It is the opinion of the New York State Department of Agriculture and Markets that this ruling applies to all persons engaged in harvesting crops for canning purposes.

More Shuffling of Gov't Bureaus

LAST TIME on this page, we reported in detail President Roosevelt's first Reorganization Plan, sent to Congress on April 25. This month, Congress received and approved Reorganization Plan No. 2, calling for further changes in government agencies.

New plan abolishes six Federal agencies—National Emergency Council, War Finance Corporation, Director General of Railroads, Board of Trustees of National Training School for Boys, National Bituminous Coal Commission, Consumers' Counsel of National Bituminous Coal Commission, and Codification Board. Functions of these offices are to be transferred to various Federal Departments.

To be shifted to other Departments are 14 other agencies, including the heretofore independent Rural Electrification Administration, now to be part of U. S. Department of Agriculture.

More reorganization plans will be forthcoming at next session of Congress, said President in his message to Congress explaining Plan No. 2.

No Coal Famine

MORE than 300,000 miners went back to work last week when strike in soft coal industry ended. Finish of six-weeks' strike came after President Roosevelt warned operators and John L. Lewis, president of United Mine Workers and of C.I.O., to get together at once and settle their differences. All mines, except those in coal counties of Kentucky, Tennessee, Virginia and West Virginia, reopened, ending danger of coal famine which was threatening continued operation of railroads, factories, and public utilities.

Victory went to miners' union, which won a "union shop" from operators who signed up. This means that all

workers in mines under contract must join United Mine Workers. Aside from this, contract is same as old one.

Importance to United Mine Workers of "union shop" is that it stops growth in East of rival A. F. of L. mine union, and also puts John L. Lewis, as head of C.I.O., in strong position to press for union shop in automobile, steel and other industries organized by C.I.O. unions.

This increase in C.I.O. power was what coal operators tried to prevent by refusing to agree to union shop. President Roosevelt's intervention forced most of them to give in. Still holding out against union domination, as we go to press, is Kentucky's "bloody Harlan" County, where Governor Chandler has sent National Guardsmen to protect reopening of mines without a contract. Many miners there protested that they wanted to go back to work, contract or no contract. Governor's answer was to send troops to enable them to do so. "No one," he said, "can tell our people to work or not to work, and no one can come into this State and cause trouble."

Minnesota Farmers Curb Union Labor

MINNESOTA now has a State Labor Relations Act which acts as severe check on unfair activities of union labor in that State. Angry farmers are said to have brought about enactment of the law.

Last year, during city truck strikes, pickets pounced upon farmers hauling livestock, garden truck, milk, etc. Sometimes they just turned back the farm trucks, but frequently they rolled them in the ditch. New law contains provision making it illegal to interfere with operation of trucks when neither owner nor operator is a party to a strike.

Another thing which got farmers' dander up and resulted in collapse of Minnesota Farmer-Labor party last year was north woods strike of timber workers, during which highways were blocked to farmers who made a winter income hauling pulpwood to paper mills. New law now makes it unlawful in that State "for any person at any time" to interfere with free and uninterrupted use of highways and streets or methods of transportation."

SLANT: More States could use a labor law like Minnesota's.

More Immigrants?

INTRODUCED in Congress by Senator Wagner of New York and Representative Rogers of Massachusetts are bills which would amend nation's immigration policy. Quota system of immigration has been in force since 1921.

Suggested is to permit entrance of 20,000 children from Germany during the next two years, in addition to present legal immigration quota. Restrictions would be that they must be under 14 years old and that private individuals or institutions must agree to support them without expense to government.

Statement is made that quarter of million dollars has already been pledged for their support and that more than 5,000 have been promised homes by families and institutions.

Opposition to plan centers on argument that it would increase nation's

American Agriculturist, May 27, 1939

relief and tax problems and add to burdens taxpayers are now carrying.

Payroll Tax

RECOMMENDED to Congress by House Ways and Means Committee is freezing of Social Security Old Age payroll tax at 1 per cent for next three years instead of automatically increasing as provided by law. Estimated yearly tax saving to employees and employers is \$825,000,000.

Idea behind suggestion is that turnover of dollar left in taxpayer's pocket is three times as rapid as tax-collected dollar artificially forced into trade channels through relief and public works, therefore giving more impetus to recovery.

Less Tension in Europe

AS WE GO to press, things look a more hopeful for peace in Europe. Premier Mussolini, speaking at Turin, Italy, last week, said: "There are not at present in Europe problems big enough or acute enough to justify war." Though he spoke of present problems as "knots in European politics which must be untied once and for all," he declared that it would not be necessary to cut them with the sword.

Mussolini's moderate speech was hailed as good sign in France and England, both of which took it to mean that Italy's premier knew he couldn't win a war against the democracies. Recent events which are thought to have been responsible for Mussolini's more peaceful tone are: British-French guarantee of Greece's independence; new British agreement with Turkey; and growing dislike among Italian people of Germany getting grip on Italy under pretense of a military alliance.

Meanwhile, Poland continues to fear sudden move by Germany in Polish Corridor. Ever since Czecho-Slovakia was gobbled up last March by Germany, Poles have been on tenterhooks, fearing German seizure of Free City of Danzig and Polish Corridor. However, British-French pledge to aid Poland if attacked by Germany, and Polish Foreign Minister Beck's recent refusal to surrender any Polish rights to Germany, seem to have slowed up for present whatever move Hitler is planning against Poland.

Washington Farm News

Subsidized Cotton Exports Defeated

DEFEATED in Senate was bill for government subsidized exports of cotton. Nevertheless plan may be tried, using part of \$90,000,000 allocated to Department of Agriculture from tariff receipts. Opponents charge plan would start trade war, would make American cotton cheaper to foreign consumers, would drive down prices in this country, and would intensify rather than solve problem.

Proposed by members of cotton trade is discontinuance of government cotton loans and substitution of direct subsidy to cotton farmers; this to be followed by sale, beginning next year, of definite amounts of government-held cotton over period of years.

Agricultural Appropriations

Forgetting economy, Senate by 61 to 14 vote passed record Department of Agriculture appropriation bill of \$1,218,666,572. Appropriation exceeds budget by almost \$400,000,000 and is largest in history. Bill now goes back to House, where battle is expected on increases added by Senate.

Previous to Senate action of this

bill, House had voted to go along with existing farm program, providing U.S.D.A. with the 841 millions that President Roosevelt asked for it for next fiscal year. This appropriation did not allow for 212 millions of special "parity income" payments to farmers, being made in the present fiscal year. Senate increase provides 225 millions for these payments on an even slightly larger scale than during this year; also, Senate voted 113 millions more for "surplus removal."

Farm Program Sentiment

American Institute of Public Opinion asked question: "Do you think the Roosevelt administration has done a good job or a poor job in handling the farm problem?" Answers were: good job—48 per cent; poor job—52 per cent. Southern and mid-western farmers reported: good job—53 per cent; poor job—47 per cent. Survey indicated Secretary Wallace is personally popular with 58 per cent of those replying.

Argentine Beef

Beef cattle men jumped into verbal action when President defended purchase of Argentine corned beef for U. S. Navy. Lowest bid for domestic product was about 23 cents a pound, compared with Argentine's bid of 16 cents, which includes 6 cents import duty, making net cost about 10 cents. President maintained Argentine product was better as well as cheaper. Senator O'Mahoney of Wyoming proposes amendment to pending Navy appropriation bill to prohibit purchase.

No Marketing Quotas for Wheat

In view of estimated winter wheat production of 543,928,000 bushels May 1, well below 1938 production and 1919-28 average, Secretary Wallace announces there will be no referendum by producers on question of quotas to limit amount marketed by growers. No estimate has been made on spring wheat crop, but recent growing conditions have been unfavorable.

Get Milk-Conscious

MONTH of June will be Dairy Month, when will be staged largest campaign in history to promote increased consumption of milk and dairy products. There will be nationwide radio hookups, front page news, store front displays, and advertising tie-ins of all kinds with food, drug and variety stores both chain and independent. Restaurants, railroads, bus and airplane lines will join hands with the dairy industry to make nation milk and dairy product conscious, thereby adding to health of consumer and profit of farmer.

Back of campaign are National Cooperative Milk Producers Federation, National Dairy Council, Milk Industry Foundation, American Butter Institute, National Cheese Institute, International Association of Milk Dealers, International Association of Ice Cream Manufacturers, National Association of Chain Drug Stores, National Association of Food Chains, Independent Food Distributors Council, and National Association of Retail Druggists.

Senator Extols Milk

Recently elected a Senator, Alexander Wylie from Wisconsin got attention of Congress other day when he boosted dairy industry of Wisconsin. Said Senator Wylie:

"Wisconsin cheese is product of state's 185,000 dairy farms and 2,000 cheese factories. That cheese is made from milk from cows that fed on Wisconsin's juicy sweet-scented clover and luscious alfalfa, and drank the cool water from thousands of Wisconsin springs."

If senators and other citizens would eat cheese regularly, Wylie claims, it

would make people more reasonable, make rouge unnecessary, cure nervousness in children, prevent TB, add flavor to diet, and last but not least, solve the dairy problem.

SLANT: What the world most needs is more senators like Wylie. Everything he said about Wisconsin cheese applies to all dairy products.

Farm Buildings "Wholesale"

LAATEST wrinkle in construction of farm buildings comes from Tennessee Coal, Iron & R. R. Co., branch of U. S. Steel Co. Their idea is to supply farms with pre-fabricated steel buildings in units of five, including farmhouse, barn, chicken house, smokehouse, and privy.

Buildings will be sold at wholesale, for less than \$3,000. Company advertises that pre-formed panels can be erected and bolted together without skilled labor.

First experiment was with 14 units which company sold to Farm Security Administration for use in southern states to replace sharecroppers' shacks. Barn is said to be 20x32 ft., contains corn crib, hay loft, implement space, and two compartments for stock. Poultry house accommodates 50 fowls, is ventilated, and has a special device to protect flock against prowling foxes or thieves. Chickens enter on a ramp which can be folded up and locked to form a door at night.

Sweet Potato Starch Has Many Uses

GETTING to be important source of starch is the sweet potato. Last year, according to figures recently published, 2 million pounds of starch were extracted from sweet potatoes at plant in Mississippi. This year, same plant expects that its production will reach 5 million pounds, due to increased plantings of sweet potatoes by Mississippi farmers.

National Farm Chemurgic Council, as well as researchers employed by private industries, is finding more and more uses for sweet potato starch. Though it is not expected that it will ever take place of cornstarch (which amounts to 90 per cent of national production of starch) sweet potato starch may eventually displace 480 million pounds of root starches now imported into United States.

It is predicted that southern farmers in other States may choose sweet potato as substitute crop for cotton and establish starch processing plants of their own.

To Prevent Farm Fires

HARDLY a week goes by in the farm country that one cannot see blazing farm buildings on the near or distant horizon, bringing disaster, ruin and even death to farm folks. About \$90,000,000 annually of farm buildings and equipment go up in smoke. Worse still, 3500 lives are lost each year, and 4500 more injured or maimed.

The Chamber of Commerce of the United States prints some very good rules for preventing fires. Here are a few:

1. Keep chimney flues clean and protect wall and floor from stove by metal or asbestos plate.
2. Don't dry clothes, shoes or kindling wood in bake oven or near stove, or keep a basket of waste paper beside stove.
3. Keep lamp away from walls and curtains.
4. Don't fill lamp while lighted or

set lighted lamp on tablecloth where children can pull it off.

5. Keep matches away from children.
6. Don't leave children alone in house with fires and lighted lamps.
7. Take matches out of pockets before hanging away clothes.
8. Don't allow greasy overalls, oily mops and polishing cloths to accumulate in closets, attic or corners.
9. Keep kerosene and gasoline safely stored and in properly labeled receptacles, and use oil and gasoline stoves with due care.
10. Don't pour kerosene on fires or clean clothes with inflammable fluids near fire.
11. Have electrical equipment properly installed and use appliances with due care.
12. Don't continue to use badly worn cords.

If interested in organizing to prevent or control fires in your neighborhood, write *American Agriculturist* for a fire prevention bulletin published by the United States Chamber of Commerce.

Good Books to Read

INDUSTRIAL AND LABOR RELATIONS IN GREAT BRITAIN, Gannett and Catherwood. Recently great interest has been shown in this country in the way the British have handled their industrial problems, and Mr. Frank Gannett, always interested in international situations, together with Dr. B. F. Catherwood, an experienced economist, visited England and interviewed many key men. The resulting volume is full of factual data illustrating the methods and policies in British labor circles, and is written with the hope that it will help leaders in industry and labor circles and the men in the ranks to find a way to bring about a better understanding, and more prosperity and happiness for all concerned.—*America's Future, Inc.*, 205 East 42nd Street, New York. \$2.50.

WINE OF GOOD HOPE, David Rame. This story has half the world for its canvas, from the Cape of Good Hope to the Coast of Maine. Wanderlust in a young man's blood leads him to desert the girl and the land he loves to follow in the footsteps of his almost legendary father. Adventure follows adventure as he seeks to reconcile his conflicting passions. At last, his yearnings satisfied, he returns and finds peace with the girl he has loved since childhood.—*The Macmillan Company, New York*. \$2.50.

Good Movies to See

WUTHERING HEIGHTS. Out of the romanticism of 19th Century Britain came a series of novels about the gloomy English moors, and among them the novels of the Bronte sisters. Now Goldwyn has filmed *Wuthering Heights*, which reproduces the windswept landscapes, the strong speech, high passions and dour moods of a haunting period of English literature.

JUAREZ. The story of Mexico's struggle between democracy and monarchy is vividly told in this story of the struggle of Archduke Maximilian of Hapsburg, enthroned as Emperor of Mexico by Napoleon III, against Benito Juarez, an Indian shepherd, whose dream it was to free his country of foreign despots and teach the people to govern themselves. Paul Muni plays Juarez, while the parts of the imperial couple are played by Brian Aherne and Bette Davis.

GOODBYE, MR. CHIPS. In 1933 James Hilton wrote a novel about the life of an elderly English schoolmaster, called it "Goodbye, Mr. Chips." When Alexander Woolcott boosted the story on the radio, it rapidly became a best seller. Now we have the movie version of the hero's quietly eventful years at Brookfield School, his deep love for the school and the school's for him, his retirement and final return, when the headmaster goes to the war, to run the school. Robert Donat gives a fine rendering of the schoolmaster.

How Many Calves NEXT SPRING?

Don't let Slip-ups in Summer Breedings Cheat You on Spring Freshenings! How many calves did you get this year — out of how many cows? How many services did it take to get your cows to catch? Another breeding season is just ahead. If you want spring freshenings on time — do something now to make your summer breedings stick!

Feed ADM Cold-Pressed WHEAT GERM OIL For Surer Breeding Insure Vitamin E. No vitamin E—no breeding! Too little vitamin E—blanks, misses or slips! For surer breeding—insure ample vitamin E.

Many Breeding and Calving Failures Can Be Prevented If You Act Now If no infectious diseases are present, breeding disorders due to vitamin E deficiency can usually be prevented by feeding ADM cold-pressed Wheat Germ Oil. Now is the time to act.

Learn How Other Stockmen are Cutting Breeding Losses Get full information at once. Learn about successes of other outstanding breeders. 1 pint \$4.00. 1 quart \$7.50. Money-back guarantee.

Electrified Farm at World's Fair

ONE OF THE exhibits at the New York World's Fair is a completely electrified farm. Shown in the picture above are nine Guernsey cows with an average of 11,873 lbs. of milk and 656 lbs. of butterfat. Cows are owned by the Foremost Guernsey Association, Hopewell Junction, N. Y.

At the farm, which is one of two exhibits of the Electric Utilities Industry, is a farm house with farm buildings completely equipped with cattle, horses and chickens.

The house is equipped with an electric range, dish-washer, garbage disposal unit, as well as small appliances such as mixing bowls, grinders and toasters. An exhaust fan helps to keep the kitchen cool and free of odors. A refrigerator is divided into two compartments, one for quick freezing of meat, fruits, and vegetables.

The cow barn is lighted, ventilated and supplied with water by electricity, and has equipment for grinding and mixing feed. In the milk room milk is run through an electric pasteurizer, and utensils are sterilized in an electric sterilizing cabinet.

A work shop, which is necessary to keep equipment in order on the modern farm, is equipped with a forge, drill and saw, all operated by electricity; as well as a portable electric arc welding outfit.

Electric current lights the poultry house, provides heat for the incubator and hover, and provides light for a candler and power for an egg cleaner and grader.

Other parts of the farm show how electricity can be used to clean and grade fruit and to heat greenhouses.

Electricity on the farm is by no means new, but here are shown in one exhibit additional uses to which it may be put on the farm of tomorrow.

The problem of weed control is always with us. Up-to-date information on how to control weeds, with a thorough ex-

planation of how weeds are spread, is contained in a new booklet "Weeds and Their Control", published by John Deere of Moline, Ill.

During June an extensive drive will be put on to increase consumption of milk and milk products. Twenty-five company members of the *Institute of Distribution*, with over half a million employees operating 15,000 stores with total sales of two and a half billion dollars, will advertise milk and push its sale in their stores. The group includes chain stores with soda fountains and lunch counters and drug stores, as well as many concerns who do not actually sell milk but who nevertheless are interested in doing their part to aid dairymen by boosting consumption.

Three two-reel motion pictures of special interest to farm groups may be borrowed from the Motion Picture Division of the *Goodyear Tire and Rubber Co.*, Akron, Ohio. The only expense involved is the payment of return charges when the films are shipped back. Films are available in either 16 or 35 mm., and subjects are: "Conquering the Desert," "Farmer Miller Goes Into High Gear," and "Future Farmers in the North Woods."

The *J. I. Case Co.* Syracuse branch is rebuilding their warehouse adjoining the branch house.

Increased egg consumption will help poultrymen. The *New England Fresh Egg Institute*, 667 Main St., Worcester, Mass., is stimulating egg consumption by publishing a booklet "Eggs—100 Tempting Ways to Serve Them." Due to the limited funds of the Institute, it is necessary to ask that those who wish copies of the booklet enclose 9c in coin or stamps.

NEARBY MARKETS for NEARBY POULTRYMEN

Cackleberries

By J. C. HUTTAR

A HUNGRY tourist pulled his rolling, iron steed alongside a highway diner, jumped out of his car, walked into the end of the diner and informed the young man standing behind that end of the counter that he craved some ham and eggs. The young man turned toward an older man standing in front of a sizzling, sputtering frying pan and called, "An order of hogs hips and cackleberries." (With apologies to Eastman's Chestnut for getting into his field.)

But speaking of cackleberries brings me to the matter of fruit.

Speaking of Surpluses

We've heard a lot about agricultural and other surpluses in the last seven years since low buying power has turned every reduced production into one of these surpluses. And when I look at the government hatching reports this spring I'm inclined to think along these lines.

But, as a poultry and egg-minded fellow, I was quite cheered up yesterday, when I read the transcript of ten radio broadcasts given by Mr. Teague on citrus fruits. Mr. Charles C. Teague is president of the California Fruit Growers Exchange, a farmers' cooperative organization owned and operated by 14,000 California citrus fruit growers. In one of his broadcasts Mr. Teague said, "Government figures for 1939 orange and grapefruit production indicate an increase of 41,000 cars or 39% over the past five-year average."

And what do you suppose his very next sentence was? Here it is,—"But there is much that is hopeful in the outlook."

If Lee Weaver happens to glance over from across the page over there you'll probably see him shaking his head and saying, "There's one of those 'incurable optimists' I wrote about in the last issue."

But I don't think so, Lee. After all, Mr. Teague has for the last 19 years headed an outfit that marketed 80,000 cars of citrus fruits last year. So, I say, he's an optimist, but not one of your incurables.

Building Demand

For at least 18 years I had heard about this California farmers' organization and I kind of got the impression that it was quite an outfit. But I admit that I had very little conception of what and how much it had done in the development of the citrus industry. So there was much more that interested me in Mr. Teague's broadcasts.

He said that his cooperative was formed 45 years ago when a total annual orange crop of 6,000 cars produced such a surplus that resulting low prices almost wrecked the industry.

Sales work was begun immediately, especially in the Eastern markets and by 1907 a 30,000 car crop was marketed without distress. This in 13 years of organized sales effort and without advertising.

Mr. Teague then went on to tell that a strange, new force, called advertising was tested. Results in increased demand were so immediate that a national advertising campaign was mapped out. And, according to Mr. Teague, The California Fruit Growers Exchange has spent 27 million dollars in advertising Sunkist citrus fruits to the world since that time. He states that

this amount represents a little more than 1% of the delivered carload value of the fruit. Mr. Teague went on to cite two results of this intensive advertising.

1. Annual orange consumption has increased from 30,000 to 75,000 cars and lemon consumption has increased 60%.
2. Sunkist fruit brings a substantial premium over other citrus fruit because of the preferential demand created.

Doesn't Claim Full Credit

Mr. Teague then went on to say that some folks give their advertising campaign little credit for the increase in consumption of citrus fruits. They say it's due to educational propaganda from doctors, dentists, nurses, and dieticians. He admits this has been very helpful but he asks a series of questions to bring out his point on the value of the Sunkist advertising. I won't repeat them, but I think he made his point all right. Perhaps the strongest argument he advanced was this.

"The demand for apples and many other fruits declined all during the depression. The demand for citrus fruits has risen constantly."

Enough on Oranges

As I write this I have a little sniffle and if I don't quit reading this stuff I'll be drinking extra orange juice instead of eating extra egg yolks which are so rich in the cold-preventing vitamin A.

The only excuse for spreading lemons and grapefruit all over this egg page is because I think the story has some tie-up with marketing our Northeastern eggs.

To bring this out I'd like to ask two questions.

1. Has this tremendous increase in citrus fruit consumption had any effect on the consumption of eggs?
2. Can the egg man take a leaf from the book of experience of the orange man in building demand?

On the first, my answer is, "Yes."

I don't think I have to furnish proof that citrus fruits have become more and more common in the breakfasts of American people. I guess we're also agreed that eggs are not as popular in that meal as they used to be. I know that one reason is that folks don't work as heavy nor eat as heavy as they used to. But that doesn't satisfy me as a complete answer.

I'm not going to answer the second. I'm going to let you do that.

I would like to make a couple of statements that you might want to consider, though.

In the past seven years I've sat in on several dozen meetings called to discuss ways and means of boosting egg consumption. When the question of a producer financed campaign came up the stumbling block was always met of how to get enough producers together and supporting such a campaign to make it worthwhile.

The California citrus folks are in a different boat. Mr. Teague says that his organization markets 70% of the oranges and 90% of the lemons produced in that state.

Here are two suggestions.

1. There is a National Federation of Poultry Producers.
2. The World's Poultry Congress is the most complete all-industry organization ever to function in this country. It should not be allowed to disband after the Congress itself has been successfully staged.

That's Just One More Good Reason Why You Must Support It.

J. C. Huttar

NEARBY MARKETS for NEARBY POULTRYMEN

Too Many Eggs

By L. E. WEAVER

AT A RECENT poultry meeting I ventured the remark that within two or three years we will probably have fowl paralysis as well under control as we now have fowl pox, pulorum and other troubles that once were night mares to the harassed poultryman. A deep masculine voice from

L. E. Weaver

the audience stated that when that day arrives it will be so easy to produce eggs that they won't be worth anything and no one will make anything in the poultry business.

As a rule I confine my meditations and writing to ways and means of doing a better job of keeping poultry and producing eggs. The economics and philosophy of the chicken business I leave to those whose job it is to study those angles and give us the "low down" on them. I must confess that that remark about too many eggs set me to thinking. I felt that there is something wrong about it, yet could it not easily happen? Indeed, has it not already happened? Here is a problem more fundamental than the selection of the right chicks, or the method of rearing them. Perhaps we should not get any chicks at all. It seems such an important subject to me that for this once I am venturing to express some opinions about the general welfare of poultry keepers and others.

We have all been working, almost feverishly, to breed better layers, to get better hatches, to mix better and better rations, to build better and more efficient houses, and to control diseases. To a great extent success has crowned our efforts. Fewer men with fewer hens today can produce more eggs than ever before. More eggs than can be sold at profitable prices. Of course that is efficiency. But what has it given us? Broilers that once paid for the feed to raise the pullets are often a drag on the market, so we get sexed pullet chicks. Instead of 50% production and 80c eggs at the height of the season we now have 80% production but never more than 50c eggs. Each year it becomes easier to get eggs but harder to make a living. In spite of all this, more people enter the business every year. No wonder the poultryman asks, "what will we do when it becomes still easier for people to go into chickens?"

At this point it may be in order to remark that things would not be so bad if instead of people going into chick-

ens, more chickens were going into people. That is, if everyone had all the chicken and eggs he could eat there would not be enough to go around. I am sure that is true. There is no overproduction of eggs, only a lack of consumption. But suppose a campaign to

See Europe With Us This Summer

THOSE HOT, sunny days that come one after another in July are perfect days for boarding a great ship and heading out into the ocean's cooling breezes. From the moment you climb the gang plank, you enter a magic, carefree world, where time slips by so gently and so agreeably that you lose count of the hours.

The personally conducted, "all-expense" trip to Europe that we have planned for *American Agriculturist* folks this summer (July 28-Aug. 24) has the added advantage of using the northern route to Europe. This means that we will embark at Montreal, which will give us two days on the St.

increase the use of eggs and poultry should stimulate demand and boost the prices, would not the slack be taken up very soon by a new rush of folks into the business?

So we go round and round in circles and come out nowhere. The only way out that I can see is to fix things up so that the folks that want eggs and need them can have something to buy them with. I don't worry at all about any egg surplus if the big American public regains its purchasing power. Nor should that be such a tremendous

(Continued on Page 16)

S.S. Empress of Britain, the luxurious Canadian Pacific ocean liner which will bring our party home from Europe.

Lawrence river in which to become accustomed to the ship and to get our sea-legs. On reaching the other side, we will again have the fun of a river trip, for as our boat goes up the river Clyde to Glasgow we will get intriguing glimpses of Scottish farms and towns. So many are the fascinating places that we will see in the seven European countries to be visited that it is difficult to pick out the high spots; but it is safe to say that those first few days on Scotch soil will be as thrilling as any. To set foot in the Old World, to travel by coach and lake steamer and bus through the land of the Lady of the Lake, to see grim castles and ruined cathedrals that speak of long ago wars and of dead kings and queens—these are experiences that you will never forget.

But every step of our journey will be filled with beauty and romance and interest. The pages of history will come to life as places which have been

are going, or otherwise we cannot hold the excellent accommodations that we have spoken for.

If you have not already done so, write us today for an itinerary, using the blank below. The itinerary gives full details of the marvelous tour we have planned through Scotland, England, Belgium, Holland, Germany, Switzerland, and France. The price of \$497.50 for this four weeks European trip includes all expense, except your passport and personal items such as laundry and souvenirs. Experienced escorts will have charge of all details of the trip, so that you will be able to enjoy this vacation free from responsibility and travel worries. And don't forget that those who join our party will have the company of congenial folks, the kind who make up all *American Agriculturist* tours—and that means the best there are! Make up your mind to come with us. We promise you that you will never regret it.

Dear Mr. Eastman:

I am interested in your European Tour, July 28-August 24. Please send me, without any obligation on my part, full information regarding the trip, with complete itinerary.

Wonderful Success Raising Baby Chicks

Mrs. Rhodes' letter will no doubt be of utmost interest to poultry raisers who have had serious losses raising baby chicks. Read her experience in her own words:

"Dear Sir: I see reports of so many losing their little chicks so thought I would tell my experience. My chicks, when but a few days old, began to die by the dozens. I tried different remedies and was about discouraged with the chicken business. Finally I sent to the Walker Remedy Company, Waterloo, Iowa, for a 50c box of Walko Tablets. They're just the only thing to keep the chicks free from disease. I raised 700 thrifty, healthy chicks and never lost a single chick after the first dose."—Mrs. Ethel Rhodes, Shenandoah, Iowa.

You Run No Risk

Buy a package of Walko Tablets today at your druggist or poultry supply dealer. Give them in all drinking water from the time chicks are out of the shell. Satisfy yourself as have thousands of others who depend on Walko Tablets year after year in raising their little chicks. You buy Walko Tablets entirely at our risk. We guarantee to refund your money promptly if you don't find them the greatest little chick saver you ever used. The Waterloo Savings Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of our guarantee. Sent direct postpaid if your dealer can not supply you. Price 50c and \$1.00.

Too Many Eggs?

(Continued from Page 15)

difficulty. There are millions of idle workers in the land, and billions of idle dollars in the banks. It seems absurd that prosperity does not abound.

THE REMEDY?

I have read magazine articles and newspaper editorials, and even books on this subject. Always I come back to the conclusion that the trouble lies in our uncontrolled monetary system which permits constant shifts in our unstable price level. Prosperity will return and remain, I am convinced, when the price-level has been brought under control and stabilized. I prefer to advocate that policy rather than try to keep people out of the chicken business. I believe in a philosophy of abundance, not a philosophy of scarcity.

Keep the Layers Indoors

THE MOST successful poultrykeepers today never let their laying hens outside. There is no good reason why they should be allowed outside. There are several excellent reasons for not letting them out.

When the hens run outside they eat green stuffs. The green feeds darken the color of the yolks of the eggs. Such eggs will not bring the top prices on the New York market.

If the hens are outside and unfenced the ground for a long distance in every direction may become infected and unsafe for young stock.

Some people think that hens are happier when they can get outside, and that therefore they lay more eggs. Repeated tests have shown that they actually lay less eggs as a rule. Probably this is because they are picking away at a bunch of grass or a burdock leaf when they should be eating mash. It is the mash that makes eggs.

As for happiness, you will find on a sweltering day in mid-summer that the most contented hens are inside where it is cool. You may ask, "where do you find a cool poultry house on a hot day?" A house with window openings on opposite sides for cross ventilation, and with insulation on ceiling and sides will be much cooler than the outdoor air.

Perhaps someone has told you that your birds "need" green feed, and that the green stuff they eat will cut down the amount of mash you must buy. It is very true that you can cut down a lot on the feed bill for your chicks, if you range them on a good poultry pasture, but it is not true for laying hens. Here is the proof.

The Western Washington experiment station fed three lots of pullets alike except that No. 1 had seven per cent of dehydrated (dried) alfalfa added

to the ration, No. 2 had 5 pounds of green feed per day for 100 pullets plus 7 per cent alfalfa, and No. 3 had the same amount of green feed, but no alfalfa.

There was but little difference in egg production. It was highest in pen 1. Mortality was lowest in that pen. Albumen quality was not noticeably affected by the rations. Strangely enough the flocks with the green feed ate as much mash as the others. They were not out-of-doors. Yolk color differences were greatest in the pens with green food.

For the reasons stated I believe the best practice is to keep laying hens indoors. Nor have I even mentioned the annoyance of having the hens digging in your garden and flower beds, or roosting out in the shed on the grain drill or hay rake.—L. E. W.

Your Questions Answered

Keep Chicks Busy

Why do chicks pull feathers out of one another until they start bleeding, then pick at the blood and often kill each other?

Cannibalism, as this vice is called, is only found among active, alert, rapidly growing chicks. Like a lot of live-wire boys and girls in school, they need something to do or they soon get into mischief. Give them more room. An outdoor range is best. Keep them in smaller flocks. Separate the cockerels from the pullets. Put in more feeders. Be sure the growing mash contains ground oats.

Avoid Chilling

At what age can the young pullets get along without heat?

It depends on the time of year and to a less extent on the breed. Rapid-feathering varieties such as Leghorns and New Hampshires require heat for a shorter period than Rocks and Rhode Island Reds. In cold weather all breeds will need heat for eight to ten weeks, perhaps more. At this time of the year, five or six weeks may be

Say you saw it in AMERICAN AGRICULTURIST.

enough. Better leave the brooder stove in for a few weeks, ready to be lighted on frosty nights.

No Shells for Chicks

Do chicks need oyster shells?

Definitely no. Laying hens do need crushed oyster shells or some other source of lime with which to make egg shells. Chicks don't lay eggs, so they don't need extra lime. Modern chick rations are supplied with all the lime the chicks need. More will probably cause trouble. For the same reason, grit for the chicks should not be limestone grit.

Grit Essential

Do chicks need any grit?

Yes. Chicks need a hard, insoluble grit to develop large, muscular gizzards. On most farms as soon as the chicks are outside they will pick up their own grit.

Continuous Culling

When should culling begin?

Here is a quotation from Edward S. Walford in *Cackle & Crow*: "Culling never stops on good poultry farms. To save on adult culling, start your culling on the hatching eggs, then the chicks, next the young stock, and finally the pullets as they are housed." To this it may be added that culling in the adult flock is a continuing process. It reaches its peak in mid-summer and early fall.

Pesky Mites

How do red mites get into the brooder house, and how can you get them out?

Probably they were originally carried from the laying house to the brooder house by the caretaker. Of course, it was unintentional. Possibly sparrows may have been guilty. Once established, they live over from season to season, hidden away in cracks and joints. Carbolineum, or some similar red mite destroyer, is best because it penetrates and one application is sufficient for an entire season. However, you can't put it on when there are chicks in the house. The fumes are too strong for the chicks unless they are half grown. For the time being, you had better spray kerosene liberally and repeat in a week.—L. E. W.

Color

IN YOUR HOME

by
MRS. GRACE WATKINS HUCKETT

What boy would not revel in the nautical spirit of this attic bedroom with its built-in bunk and scrubable walls and floor? A new, smooth surfaced fiberboard combines insulating and noise-quieting value. It comes in the form of planks, boards or panels and may be combined in different widths and colors to make a very interesting wall surface. Colors are coral, ash, green, cream and white. The linoleum covered floor is colorful and easy to keep.

Color, color everywhere, indoors and out — this is nature's own antidote for low spirits! What a change today from those livingroom taupes and mauves of ten years ago, when "one spoke in whispers in such a room, expecting that the corpse was just behind the screen somewhere."

Certain fundamental rules govern, of course, the use of color, but whether or not you have learned them don't be afraid to use color in plenty; experiment with it. Wallpaper, paint, calcimine, colored plaster or the various wallboards or coverings, some of them imitating wood — all provide ways of getting a beautiful background in the home. Walls, ceilings and floors, since they are the largest surfaces, should be moderate in tone, with vivid colors used in small objects for accent or emphasis.

Draperies offer one of the least expensive ways of altering your color scheme. Though it is not always possible to do a whole room over, you can always make use of the dye pot. If you do start from scratch by selecting new material and making it up, you can give your room any atmosphere you wish, simply through the texture, color and pattern of the material you choose and by the way you make it up. Rough walls call for rougher texture in the curtains and more vivid colors to give an appearance of strength. Smooth walls call for curtains delicate in texture and color. Besides the great array of beautiful printed curtain materials — linens, chintz, cretonnes, calico, sateen or even gingham — there are the fascinating possibilities of dyeing one's own damask, tobacco cloth or cheese cloth, or using the latter two "as is" with colorful decorations, cutouts, ball fringe, rickrack or bias binding with tie-backs thrown in for good measure.

The various devices of draping the curtains at a different angle may change the entire appearance of a room. At this time of year I hardly need mention the freshening effect of mere washing and ironing and, in case of over-flimsiness, of starching as well.

Color has a large part in determining whether a room is darkly depressing, sunnily cheerful, thoughtfully dignified, or informally intimate. The sunny colors belong to the yellow family, of course. Any shade of blue tends to formality because blue is a cool color. A good mixture of the sunny and reserved colors is green, which contains both blue and yellow. Red is exciting and therefore has to be used in small quantities, if a quiet, restful feeling is to be achieved.

Light pastel shades ordinarily indicate more intimate rooms, such as breakfast nook, bedroom or bathroom. However, some quiet modern rooms use pastel shades for a background and make them more formal by toning down with darker colors in floors and furniture.

One big surface which may present a major problem is the floor. Here again paint, varnish, shellac and wax may transform a room, but it is the floor covering which gives us our best opportunity for introducing color. This covering may be as simple or as luxurious as the general surroundings demand or purse permits. A rag rug may be hooked, crocheted, braided or woven to match any color scheme. If a manufactured rug is to be chosen, the range of colors now is

—Photo courtesy of Armstrong Cork Co.

more varied perhaps than at any previous time; weaves more practical in that they do not show foot marks, yet stand hard wear.

The new linoleums are a delight with their attractive designs and beautiful colors. Many times the best solution of the problem of an old floor is to lay linoleum over the whole, provided the floor is smooth. We all recognize the advantages of good linoleum on new floors. The whole floor takes on more interest when one of the many attractive linoleum insets graces the center or corners. These are for inlaid linoleum and they vary from plain lines and initials to ships, stars, birds, anchors, bows or whatnots. The less expensive printed linoleums come in a great variety of prices, sizes, patterns and colors. They too, may furnish the keynote for the color scheme of the room.

Consider the color of furniture; the red of an old cherry table, the gold of crotch maple, the distinctive color of lacquer or painted furniture may enhance or destroy the general plan. If there

are old nondescript pieces (which seem to collect somehow), they can be made less conspicuous by painting to match some other piece. Decalcomanias, contrasting trim, or colorful patterns for back and seat can do wonders to snap up a room or porch full of such furniture.

In fact, it is amazing how much life and interest the small objects can introduce into otherwise neutral surroundings. Pictures, vases, statuettes, bookends, table runners and scarfs, lampshades, flowers, both cut and growing, are materials for the homemaker to use in making this picture which is the interior of her home. In bedrooms, her main materials for forming a color picture are the bedspreads, curtains, runners and scatter rugs. In the bathroom besides the fixtures, color can be introduced in shower and window curtains, towels, drinking glasses, washable mats and covers for stools, hampers or whatever furniture is present. If this list does not conjure up a blaze of colors in your mind, just visit a bath shop in one of the department stores.

When it comes to the kitchen, everybody is doing things to make it colorful as well as convenient. The cabinet, stool, table, refrigerator and even the stove may form a part of this colorful ensemble. Instead of the truckhorse type of cooking utensils, we now have streamlined beauties of glass, enamel, aluminum or stainless steel and copper, the last one being suitable material for a family heirloom.

Pottery mixing-bowls have long since given up that everyday look. Now they are gorgeous in their reds, blues, oranges and greens, and delightful patterns grace others of less colorful background. A few open shelves conspicuously placed may easily be the kitchen's high spot of color if they exhibit an array of such bowls, pitchers, plates or other decorative and useful pieces. Such small objects may be chosen to repeat and emphasize certain colors in linoleum, curtains, stool covers or trim on the cabinet for instance.

HOMESICK

By Edith Horton.

Never was I one to go
Gipsy fashion, to and fro;
Never did a road to me
Beckon unendurably;
Or the whistle of a boat
Sound a too compelling note.
House-proud woman have I been,
Happy where my roots were in;
Once, when someone led me there,
In Venezia's proud square,
Once, when moonlight like a shawl
Wrapped the dreaming Taj Mahal,
Longing swept me to the core
For my sunlit kitchen floor.

Today in Aunt Janet's Garden

Pruning and Pests

WHEN things are coming on fast this season it is rather difficult to remember to do things to plants to make them bloom better next year. Nevertheless, the best time to prune early-flowering shrubs is immediately after they have finished blooming. Forsythia may even have a few of the older stems cut off clear down to the bottom. The new growth bears the best flowers, you know.

As for lilacs, the ordinary cutting off of flowers with long stems is often the only pruning they need—with due regard to the shape of the bush afterwards, of course. Any leftover dead flower heads should be cut off, as should any suckers coming up around the base.

Flowering cherries, magnolias and flowering almonds do not take kindly to pruning, and any cutting back after the blossoms fall should be done sparingly. Incidentally, magnolias may be transplanted now. Any newly planted shrub or tree is benefited by a light mulch of peatmoss, cut grass or leaves to keep down weeds and to prevent undue drying out of the soil.

Any flowering hedges have to be cut

back rather severely if they are to be kept in good condition. Spirea, deutzia and lilac are often the subjects used for such hedges. Evergreens may be pruned now if such work is needed. Only those used in hedges require more than occasional pruning.

There are always pests of one sort or other in a garden—ants usually being among those present. Special poisons are available for getting rid of them. A common chemical which may be had from any drug store is carbon bisulphide. Simply make a hole with a sharp stick, drop in a little of the poison and plug the hole with earth or cover with newspapers weighted down to hold in the fumes until the ants are destroyed. Use every precaution, as carbon bisulphide is explosive.

If cutworms are the pests which you have to cope with, a poison bait from the seed stores will get rid of them. However if you prefer, you can make your own poison bait by mixing together 1 teaspoon Paris green, and 1 quart of bran, to which should be added a mixture of 1 cup water and 1 tablespoon molasses. Scatter this crumbly material along the rows of plants in the late evening—cutworms feed at night. It loses its strength quickly and should be renewed in a few days. If there is only a plant or two that has been affected by cutworms, scrape the soil lightly within a radius of 6 inches to 8 inches and you will find Mr. Cutworm sleeping there during the daytime. Then plant a heavy foot on him.

If aphids are bothering the roots of asters, tobacco stems or tobacco dust scratched into the soil will stop them.

Let Us Not Forget

(Continued from Page 1)

unknown graves who waited for years after the war, eating their hearts out with hope, forever listening for the returning footsteps of lost sons! The only word many of those mothers ever received was a report from the War Department that the son was "missing" after the battle.

If those who would rush into war could know the anguish and the cost of it as a war mother knows it, we humans would find some other way to adjust our quarrels.

But the national cemetery at Fredericksburg is a beautiful spot. It is all an old tragedy now, almost forgotten by all but a few of us who remember because we had close relatives in the conflict.

No one can stand in **one of** those great cemeteries of war dead without crying out, "Why, oh why all this sacrifice?" But there is an answer. Our fathers believed they had found something in this American democracy that was infinitely precious, far beyond the value of life itself, and they fought for it. What is this thing we call democracy? What is it our fathers thought they had? Is it just a meaningless high-sounding word? To answer it, take a look at the Old World before the landing of the Pilgrims. Slavery was world-wide, women in most countries were not much better than slaves, the home as we know it today did not exist, education was confined to monasteries and to a few in the upper classes, freedom of worship did not exist, those who tried to worship according to their conscience were persecuted, there was little or no political freedom, government was based on "the divine right of kings", which meant that the individual existed solely for the state, not the state for the individual. Might always made right, oppression and taxation stalked the land, privation and suffering were the common lot.

Those were the conditions that the Pilgrims, the Puritans and the other New World emigrants left behind them. Do you wonder that they gloried in

their new-found freedom, in the opportunity in the new air of a new world for the individual soul to flower? These first American settlers knew from actual bitter experience what they had escaped from in the Old World. They never forgot it, nor permitted their children to forget the blessing of liberty. That bitter experience and the glory of new-found freedom were common talk in every American household for generations, even down to the Civil War. To our fathers, democracy was a synonym for true religion founded on the fatherhood of God and the brotherhood of man. It was a synonym for political freedom, the right to appoint or elect their own leaders and put them out when they failed. To them, democracy meant that the individual and not the state is paramount. To them, democracy meant not the divine right of kings or dictators but instead the divine right of the individual and the human soul.

But today we have been so long used to the blessings of democracy that we take them for granted, count them for little, and are ready to trade them for a mess of pottage. We seem to forget that nothing that we can ever receive can repay us for the loss of liberty as we have known it here on this soil for more than ten generations. We seem to forget the price our fathers paid for our privilege of living in a democracy. Tennyson once said that we are

*"Heirs of all the ages
Standing in the files of time."*

How true that is of the splendid heritage that our forefathers have given to us Americans!

The question now is, what are we going to do with that heritage? We must do something if democracy is to endure. For now the world is faced with two opposing schools of thought. One school is a strong-arm school, whose chief proponents are the dictators, who believe that democracy has failed, who would put the state first, who would restrict initiative, individu-

LOVELY THINGS

By Roberta Symmes

Twilight that like a soft gray feather falls
Into the pool of dusk. Old ivied walls,
The silver rhythm of a summer rain,
The scent of mignonette, peace after pain;
The kiss of early sunlight on a tree,
The mother-smile that little children see,
Worn, tired hands that old in service grow—
These are the loveliest things I'll ever know.

alism and personal responsibility, who believe that might makes right. Even in America we see the creeping in of this idea through the iron hand of central control. Let this school prevail and we will go straight back to conditions in the Old World which forced the early colonists to come to America.

The other school of thought believes in the slower but sure processes of democracy worked out through education and cooperation, with emphasis upon the innate value of the human soul, upon personal, religious and political liberty.

It would seem that there should be brains and goodness enough in the world to save the world for democracy, to make right triumph over might, without a war. I am against war, I know what it costs, I know that most wars are futile, but there are times in the lives of nations, just as there are in those of individuals, when one must fight for principle and for right. Let us save democracy for our children and our children's children without war if we can. *But save it we must!*

Standing among the graves of 15,000 boys who died in the flower of their youth for a principle and for democracy, I recalled John McCrae's poem, "In Flanders Fields":

*In Flanders fields the poppies blow
Between the crosses, row on row,
That mark our place, and in the sky
The larks, still bravely singing, fly,
Scarce heard amid the guns below.
We are the dead. Short days ago
We lived, felt dawn, saw sunset glow,
Loved and were loved; and now we lie
In Flanders fields.*

*Take up our quarrel with the foe!
To you, from failing hands, we throw
The torch. Be yours to hold it high!
If ye break faith with us who die,
We shall not sleep, though poppies grow
In Flanders fields.*

SUMMER, with ice clinking in tall glasses and warm breezes wafting over the countryside, calls for lovely ladies in cool frocks. Styles for all occasions for everybody, old and young, slim and stout, vacationer and stay-at-home are all included in our Summer Fashion Magazine. Besides, it includes ideas for wardrobe planning, warm weather hints and a summer fashion forecast. Send 12c for this new full color book right away. "There you are, Honeylamb — no one would ever know this is last year's bonnet made over."

MUFF — A Serial Story

By C. A. STEPHENS

THE STORY THUS FAR

Christened Henry Nemo, the name "Muff" stuck to our hero because his mother tucked him into a muff and abandoned him on the doorstep of two New England spinsters. A crimson birthmark around his neck was referred to by village gossips as "the gallows mark." At an early age he began to train animals. He exhibited two trained steers at the Fair which, against his desire, were sold for \$80.

When 14 he was hired out to farmer Glinds for \$7 a month. He refused to stay and Glinds refused to pay him. Thereupon Muff stole oats from Mr. Glinds' bin equal to the value of the work he had done. He was discovered, arrested, and sentenced to Reform School. On the way there he escaped.

Muff lived and worked in an old clapboard mill which he rented for a trifling sum and which was located about 25 miles from his old home. Someone recognized him and notified the sheriff, with the result that he was captured and returned to the Reform School. His experience made him bitter and full of plans for revenge, and he soon escaped.

* * *

CHAPTER V.

AT THIS TIME, a line of railway, known as the Portland & Ogdensburg, was in process of construction from Portland northwest-ward, through the famous "Notch" of the White Mountains, and westward through Vermont to the town of Ogdensburg, New York. The topographical difficulties in the "Notch" necessitated some extraordinary engineering devices which were much talked of at the time.

Muff had heard of these difficulties, and greatly desired to see how these things were done; and it will give the reader a curious insight into Muff's real character, that though now a fugitive, and full of the most desperate thoughts, he yet directed his flight in such a manner as to enable him to see the new railroad. He came back to this new line, which he had crossed on his way to the school, and followed it away from Portland all that night.

At daybreak he came to a large lake (Sebago) on the shore of which a party of five young men who had just landed from a large sailboat had kindled a fire, and were getting up an early breakfast, out-of-doors. They hailed him boisterously as he came along, entered into conversation with him, and gave him a share of their coffee and fried fish. Thus refreshed, he journeyed on till ten or eleven o'clock in the forenoon, and by this time felt hungry again. From a little white farmhouse beside the way, an odor of freshly fried doughnuts came to his nostrils; and in the open door of the kitchen, he saw a chair with a large tin pan, filled up full of doughnuts, set up in it. The woman of the house was busy frying more in a spider full of hot fat, on the stove inside.

Muff drew near, and when the woman came out to the pan again with more doughnuts, hot from the spider, he accosted her.

"Please give me one of them, ma'am," he said. "They smell very good."

"Oh, they do, do they?" replied the woman, sarcastically. "I shouldn't wonder if they did. But I don't stand over this hot fat to fry cakes for beggars."

"Well, ma'am," said Muff, "if you will not sell me one, nor give me one, I may steal one."

"Just let me catch you at it, and I'll scald you with this hot fat," cried the woman.

At this threat Muff prudently re-

treated, and went round the corner of the house, but stopped there, and presently peeped again. The woman had gone in to look to her spiderful of cakes. Making a rush, the boy seized as many cakes as he could hold in both hands, and ran.

This was his second theft — none the less a theft that it was a matter of small consequence. He had a scheme of far more criminal intent in his mind however. All that was evil in his nature had now come uppermost. He felt desperate and reckless, and in this mood, determined to make his way secretly back to the vicinity of Mr. Glinds' house, watch his chance of a Sunday when the family had gone to church, and then steal into the farmhouse.

He knew where Mr. Glinds kept a little leather trunk, containing his deeds, papers, and generally a sum of money. This he determined to steal, partly out of revenge and partly because he wanted the money.

Meantime, too, for he was a good many miles from Mr. Glinds' place, he concluded to look for some other prosperous-appearing farm-house which he might rob in the same way, by watching his chance, and entering it slyly.

"If I'm born to be hung," he said to himself, "I'll just go and make the old skin-flints whine. I'll give 'em something to hang me for, anyhow."

It is easy to see that with Muff's peculiar foresight and prudence in executing his plans, he might have given the public a great deal of annoyance and trouble before he was finally captured and punished. He escaped from the Reform School on Thursday night; on the following Sabbath he entered a house in the town of B—, and stole what food he desired, a coat, a cap, and between three and four dollars in money, which he found in a wallet inside a little cupboard. He also took an old treatise on natural philosophy.

The grades, cuts and bridges of the new railroad were then being made through this same town of B—; several gangs of laborers were at work, and a number of engineers were busy

striking the necessary levels for grading, or in laying the foundations for stone-work, etc. So great an attraction did these operations have for Muff that he spent a day or two watching them from the bushes along the line.

Particularly was he interested in the movements of one young man, a "leveller" in technical phrase, who with theodolite was "trueing up" the grade.

This engineer's name was Lothrop; he was known to the writer of this story; we had been class-mates three years previously. Two years later he lost his life, from an accident occurring while he was engaged upon a survey on the lower Mississippi. He was very gifted, and something more; he was one of those young men who give the impression, instinctively, that they are to be trusted. I always felt that the moral atmosphere about Lothrop was pure and wholesome; his influence on every one around him was excellent; anything like meanness would always call forth from him a quick, cutting rebuke.

As he watched, he burned to emulate the easy skill shown by that alert young man, who did his work as if born to it. Even from his hiding-place in the brush, he could see that the theodolite was a complicated instrument; nor could he find any picture like it in the old book of natural philosophy, which he looked carefully through. Still, he felt confident that he could study it out for himself, if he had it to look at awhile. All that forenoon (Monday) he watched, longing, yet not daring to approach and examine it, as it was often let set, alone, on its tripod.

In the afternoon the young engineer went on for a mile or two along the line, taking three men with him; also a tent and other gear. Muff followed, lurching off his bag of stolen victuals. Finally, the engineer set the instrument on the top of a knoll, and after looking through it carefully for some moments, sent the men off with painted rods and flags, to place signals on still other knolls and hill-tops at a distance. These workmen seemed rather stupid; the engineer shouted and made motions to them for some time. Then, berating their lack of intelligence, he suddenly started forward to go to them.

Muff waited till he had got to a distance of three or four hundred yards, then slipped out of the bushes, and

The Amateur Poet's Corner

Because of the number of contributions we do not return poems not published. Keep a copy of your poem.

The limit in length is sixteen (16) lines and poem must be original and written by an amateur. \$2.00 will be paid to the author of each one printed. Check will be mailed on or about first day of month following publication.

Send poems to Poetry Editor, American Agriculturist, P. O. Box 367, Ithaca, N. Y.

To Race With Beauty

I haven't any time for wasting now.
I'm young, and mine is cool and hilly land;
The trees grow tall and full of leaves,
The stars in glory and unnumbered shine.

Some day I shall be far too old to climb,
And much too tired for aught but thinking then;
So that my memory's coffer, colorful
As Fall, must open wide and spill a dream.

I hope I'll find a leaf, so young and green,
A welcome sight for eyes too old . . .
Or see
A breadth of sea, and smile to smell the salt
Still there near hill's height and lake's loveliness.
All mine . . . But hark, I'm young and I must go
To race with beauty while my strength's to bid,
And laughter easy come and slow to go,
With green leaf yonder calling me o'er hill!

—Hazel Lewis,
Acworth, N. H.

with the old book in his hand, went up where the theodolite was set. His curiosity said, "You will never get a better chance." Approaching cautiously, his eyes fairly devoured it, taking in every part in detail. He had no intention of stealing it, though perhaps it would not have been well to trust him too long beside it, with his recently adopted principles.

Then he peered through the telescope, and marked attentively the quadrant and vernier plates. Much absorbed, he nearly forgot the engineer, till, glancing round, he saw him coming hastily back, and only a few rods distant.

Thereupon, Muff drew back, and started to walk off.

"Hallo boy! What are you doing there?" the engineer said, impatiently.

"Nothing," said Muff. "Just looking at your instrument, that's all."

"Ever seen one before?"

"No."

"Know the name of it?"

"No."

"That's a theodolite, for levelling, surveying, triangulation, etc."

The surveyor was then busy for several minutes, looking, turning and gesticulating to his assistants in the distance.

Muff stood by and watched him attentively, taking in the object of his observations pretty well; and soon he too grew vexed at the stupidity of the two Irishmen who were in charge of the rods and flags farther down the line.

"What fools they are!" he involuntarily exclaimed aloud.

The engineer turned.

"You see what I want done?" he asked.

"Why, yes, of course," said Muff.

"Well, then, run down there and set those signals for me, please. I'd give more for one good, live Yankee boy to help me here five minutes, than all the 'navies' on the line."

In a moment Muff was off like a shot. It was a thing he relished doing. Taking the rods from the two work-

The Song of the Lazy Farmer

WHEN CORN is planted I can't wait to dig me up some juicy bait and hie me off down to the crick, where bass are hidin', fat and thick, a-waitin' to be tempted by an angleworm a-floatin' by. I like to match wits with them fish, a-thinkin' of the tasty dish they'll make, when smokin' on a plate they meet their rendezvous with fate. There ain't a thing a feller lacks in life if he can just relax, and with his back ag'in a tree just watch the cork a-floatin' free, a-waitin' till some hungry fish will make a dive at it, and swish! you land him on the bank beside, with water sparklin' on his hide.

My neighbor works from sun to sun and never has no time for fun; he thinks that fishin's just a waste of time, he doesn't have no taste for sittin' with his soul at peace, he's thinkin' of more land he'll lease next year to grow a bigger crop, he ain't got sense enough to stop, that feller

makes a lot of noise, but misses most of lifetime's joys. I don't mind workin' if I can unload it on the hired man, but what's the use of livin' if you just grow old and sour and stiff without no days to look back to when you did what you like to do. The neighbor thinks that I'm a fool for wastin' time beside the pool, a day of fishin' brings my youth right back to me, and that's the truth!

men, he set them in line, carried a fourth to another point, and then stood by, to lower or raise the slides, to obtain the desired level.

It was a service which the much-bothered engineer knew how to appreciate.

"That was well done!" he exclaimed, when Muff returned. "Can't I get you to help me a few days here? I'll see that you are paid, and paid well."

Muff hesitated.

"Where do you live?" the engineer asked.

"Most anywhere," replied Muff stolidly.

"Well, but where did you come from?"

"Nowhere."

The young surveyor gave him a searching glance.

"Look a'here, my boy! You've been cutting up some of your didoes, I expect."

Muff flushed.

"I thought so," said the engineer, regarding him still more closely. He took up the old natural philosophy, glanced through it, and at Muff again.

"Well! well!" he exclaimed. "It's none of my particular business. I don't ask you to answer any questions that you don't want to. But you seem to be just the boy I want. Better stay with me this week."

Muff scarcely dared to do so, but the desire to see more engineering work led him to consent; and observing his interest in the theodolite, Mr. Lothrop explained it to him in detail.

The weather was now quite warm, and Mr. Lothrop, having to reduce the primary survey to practical working details, had brought a tent along, preferring to live in that rather than board, for a day or two in a place, at taverns or farmhouses along the route.

Muff camped with him, and that evening, by the light of a lantern hung up to the tent-pole, Mr. Lothrop explained to him the simpler rules and diagrams of trigonometry, and also the mathematical tables of logarithms used for facilitating the calculation of distances in plane triangulation.

The keen interest displayed by Muff in these things both amused and astonished his good-natured instructor. Muff grew so absorbed that Mr. Lothrop at length took the charts, books and instruments away, and bade him to go to sleep.

Next day, in the intervals of work, the engineer allowed Muff to make several observations on his own account. These, with but casual hints from Mr. Lothrop, he was able to reduce and compute for himself.

"My boy," exclaimed the engineer, "you do this thing remarkably well! In three months you could do all ordinary surveyor's work as well as anybody. But you haven't even told me your name. Don't you want to?"

Muff did not answer for a few moments; then said, —

"They call me Henry Nemo."

"Nemo? That's an odd name," said Mr. Lothrop. "Nemo? Why, that is a

A PROFITABLE SIDELINE — L. M. Pitkin of Adams, N. Y., has been cutting posts to sell for 36 years. Recently he has been letting out the job on shares, and last spring had 1200 cedar fence posts which he sold for from 12 to 15 cents apiece. The telephone poles bring \$4 each.

Latin word; means *no one, nobody.*"

"Well, that's about the way of it," replied Muff, averting his face.

"If it's nobody now, you've got the stuff in you to make it *somebody* in the world," said Mr. Lothrop, confidently.

"I don't know about that," replied Muff, gloomily.

He sat very still for some time, but Mr. Lothrop saw that he was with difficulty repressing strong emotions. Suddenly he rose and tore open the collar of his shirt, and pointing to the "mark" round his neck, cried out, excitedly, "Look at that! What do you think of that! What would you do if you had *that* round your neck?"

"That!" said Mr. Lothrop, "why I don't see anything but a little red line. What of that, anything?"

"Don't you know that that's the gallows' mark?" cried Muff, bursting into a passion of tears.

"The gallows' fiddlestick! Who put those old woman's whims into your head?"

"I've been twitted of that ever since I was a baby, and told I was born to be hung, by everybody!" exclaimed Muff.

"What nonsense! You must have lived among a pack of fools! Why, nothing is more common than a red coloration of the skin on some part of the body. I've got one on my arm as big as a dollar. But it's only skin-deep, and has no more to do with my character or destiny than a wart or a freckle. You ought to be too sensible a boy to take stock in such old rubbish."

The young engineer was interested; he perceived that Muff's was a peculiar case, and he had little doubt that the boy had been engaged in some questionable transaction. But he would not ask him any further questions.

The week passed. Mr. Lothrop paid the boy a dollar a day for his services, and then made an arrangement to have the railway company hire him, as his assistant, at twenty-five dollars per month and board.

They worked together from May till into October; and by this time the engineer had come not only to value the boy as a clever helper, but to like him as a friend.

Yet in all this time Muff had never said a word further to Mr. Lothrop about himself.

He knew that he was liable to arrest any day. When not at work he felt gloomy. What he had done hung like a mill-stone round his neck. And he had taken a desperate resolution; when through work with Mr. Lothrop he had made up his mind to drown himself in Saco River; he had the place all picked out where he intended to jump in, with his pockets full of stones,—after saying good-by to Mr. Lothrop.

The engineer, on his part, had it in mind to have Muff go home with him, if he would; he had taken a liking to

the boy, and thought with a little instruction in mathematics, he would make an able engineer. So the evening after their final day's work, while packing up, he said to Muff, —

"Henry, I want you to come home with me tomorrow."

Muff was feeling badly,—he was, in fact, shedding tears; he did not answer for a moment or two, then said, "You cannot take me home with you, Mr. Lothrop."

"What do you mean by that? Why not?"

"Because I ought not to—I ought not to go home with you—*because I'm a criminal,*" said Muff at length.

"The boys scare Paw every April 1st. They act like they're gonna give him a bath only they don't put no water in the tub."

Kernels, Screenings and Chaff

By H. E. BABCOCK

Caught off guard, the two saddle fillies above register interest in the passing scene. They are (left) Rags, daughter of Tatters, now at the devil-may-care age of ten months, and (right) Moonbeam of Sunnygables, two years old, and commonly called "Moony."

LAST ISSUE I rather recklessly made the statement that we were planning to go back into the Soil Conservation program. Because I try above everything else to keep this page an absolutely authentic record of our farming procedure, I just want to say that I may have spoken too hastily.

I can go along on a national program of soil conservation which has for its fundamental purpose the preservation of the natural soil fertility of this country; but I can't, and never could, stomach attempts at crop control through limiting acreage.

Values Shifting

I have been feeling it in my bones for the last two or three months that we are experiencing the beginnings of a broad shift in values, a shift which will eventually result in higher feed prices throughout the whole country and relatively lower livestock prices. If this shift actually has begun, I don't want to be tied up by too many government regulations. I prefer to be free so that I can move along at the head of the procession rather than to be a number in a great regimented army, maneuvered by an economist with a sharp pencil but

with no idea of the weather which is ahead or whether or not the dictators will make a move which will start a general World War.

A Good Proposition

At the same time, I must admit that the way the Soil Conservation Program is being applied here in the northeast gives farmers a grand opportunity to stock their land with lime and phosphorus at practically no cost except the labor involved. This has its attractive features and makes a problem worthy of every farmer's critical examination.

* * *

First Eggs

Ross, who has the job of raising our pullets over at Larchmont, tells me that he got the first egg from our cross-breds on May 12. Since these pullets were not hatched until the middle of January, they are starting in to lay pretty early.

We shall follow our usual practice with birds on range of letting them get up to about thirty per cent production before we put them into the laying pens. It may have been just luck, but with every lot of pullets with which we have followed this practice in recent years, we have entirely avoided pick-outs. Despite the fact that while they are on range the pullets lay

everywhere on it, they seem to find the nests quickly when they are put into the laying house.

Crossbred Vigor

It is again our impression that our crossbred pullets are showing more constitution and vigor than the purebred pullets we are raising right along with them. As I have so often said on this page, *there certainly is something to crossbred vigor*. We see it in our crossbred Dorset-Merino ewes, in our crossbred hogs, in our crossbred chickens, and in the occasional cross we have made of an Angus and a Guernsey.

When we house our January-hatched pullets (they are Rocks, Reds, and Red-Rock crosses), which will be early in June, we shall do so with the idea of trying to get one hundred eggs from each bird and having her ready to sell on the holiday market.

To refill the laying houses then, we hope to have replacements which we will start the latter part of August. This plan of running two sets of pullets of the heavy breeds through a laying pen each year may not work out on a large scale, but on the basis of the little experimenting we have done to date and the records we have kept, it looks as though the scheme had possibilities and that it might be one of the best ways of keeping mortality down to the absolute minimum, getting two hundred eggs for the rated hen capacity of our laying houses each year, occasionally making a good thing selling birds for meat purposes and always keeping our bird inventory young.

* * *

Finicky Feeders

The more I observe the feeding of poultry and livestock, the more convinced I am that we tend to overfeed our young birds and animals and, as a result, throw them into a condition in which they finally do not consume the food or make the growth they would

if their hunger was better managed.

A few years ago, a friend in town gave us her pet cat. She was leaving town and could not possibly take the cat with her. When she delivered the cat, she also brought along two cans of salmon and told us that salmon was the only food her pet would eat.

Shortly after the cat got here, she went outdoors and encountered the farm dog, who, not having been formally introduced to her, jumped to the conclusion that she was an intruder and forced her to take refuge under the house, where she stayed for a couple of days. Emerging from her confinement, this pampered kitty walked up to a pan of table scraps and filled up until her sides bulged. Since then she has eaten anything she could get, and as a result is about fifty per cent more cat, though possibly not quite so comfortable a pet as she was when she was delivered to us a pampered, over-fed darling.

Then we have the case of the dog which was also given us along with a list of warnings about what he would not eat. After fussing with him for a day or two, we simply forgot to feed him one day and in the next twenty-four hours, like the kitty, he overcame all his food prejudices and began to take what he got and like it. Since he gets enough of what is good for him, he, too, is definitely on the way of becoming a huskier, hardier piece of dog flesh.

Now it may be a far cry from a pet cat and a dog to pullets on range, pigs in the feedlot, and of course dairy cows, but somehow or other I think the same principles prevail. *Hunger is the only constructive force which a skilled feeder can manipulate*. If poultry and livestock are so fed that they never get hungry, the feeder, in my judgment, loses control of the most important means at his disposal for building up food consumption and the growth and production which follow. (Folks are a lot the same way too, Ed.—THE EDITORS.)

Selling Poultry

I NOTICED in a recent issue where someone was complaining of the net weights on a sale of chickens. Perhaps my experience several years ago may help to unravel the mystery.

A trucker called, and I sold several hundred cockerels. Two weeks before several had averaged 1 1/4 lbs. They were a very uniform lot, and after the truck had gone, I was dumbfounded to discover the lot only averaged 1 1/4 lbs. My cousin diagnosed the trouble, having been through the mill several times, and a competing dealer finally put him wise to the trick. Here is the set-up:

The trucker, usually with a helper, calls. They offer a cent or two per pound above market for poultry, and prefer to buy in lots of at least four or five coops. They insist your scales are O.K., and that you do the weighing. They pile four or five empty coops on the scales, and the tare weight is set down. Then they fill the coops. Four or five full coops are piled on the scales, and they tell you to weigh the birds.

Some time while they are piling the full coops on the scales, or just before you begin to weigh, the coops are shoved toward the beam of the scales. This seems like a perfectly logical movement and looks as if they were anxious to have the coops firmly on the platform.

What happens is that about every third one of their coops has an inch piece nailed to the outside edge along the bottom. When they pile the coops loaded with birds on the scales, they see that one of these coops with runner is on the bottom. When they step up to push the coops toward the beam, they are actually putting more weight on this runner and taking it off the gross.

These weight artists become very skilled, and will push the coops toward the beam only as much as they think the particular customer will stand. One man thinks he lost about 50 lbs. of poultry every time they bought 200 lbs. over a period of several years. Finally he talked so much that the average weight per bird was light that they reduced the price per pound offered him and did not take off by "riding" the runner.

While we are on the subject of weights, it would be interesting to know how much produce slick truckers get away with each year in farm to city trucking. With dual wheels, I have personally seen one "Gyp" take off over a ton on a six-ton load by letting the outside dual, away from the scale house, extend over the platform onto the scale housing.—R.D.K., Preble, N. Y.

EDITOR'S NOTE: Of course all poultry buyers do not follow this or other unfair practices. This letter is printed to enable you to watch out for the occasional one who does.

More About Tractor Licenses

On the editorial page of the April 29 issue, we commented on the New York State farmer who was arrested for using a tractor and trailer to haul wood from his home woodlot to his farm without a license.

To check further, we wrote the Department of Taxation and Finance at Albany and received the following reply:

"Receipt is acknowledged of your letter of April 19 in which you inquire with respect to operating a rubber-tired tractor on a public highway by a farmer to haul wood or farm produce from one part of the farm to another or between two pieces of land owned by the same man.

"Section 2 of the Vehicle and Traffic Law provides, in effect, that 'tractors

used exclusively for agricultural purposes' do not require registration as motor vehicles in order to be operated on the highways. As far as I can discover no New York court has thus far made any decision helpful to an understanding of the said exemption. It has been the opinion in the Bureau of Motor Vehicles for many years that a farm tractor with a trailer or so-called trailer ought not to go out on the highways and do general hauling work by way of going to market, to railroad station, to warehouse, and the like, without having registration. It has seemed that the legislature never intended that trucks should be thus supplanted. However, on the other hand, the Bureau has been of the view that a tractor which is used generally on a farm may be used to haul farm produce, including wood, from field to house or barn, between two fields of the same farm, or between two farms or pieces of land owned or operated by the same person. I am of the opinion that, so long as the law remains as it now is, the views of the Bureau as outlined above should be followed." (Signed) Mortimer M. Kassell

Arrested!

Jennings Momsen of Milwaukee, has been arrested on a federal warrant charging him with use of the mails to defraud in connection with his operations under the name of Associated Adjusters, Inc.

Judging from many letters from subscribers who received letters from Associated Adjusters, they were led to believe that profitable employment could be secured in adjusting insurance losses. First, of course, an advance fee was required. Correspondence with insurance companies convinced us that there was little or no chance for such employment, which information we passed along to those who made inquiry.

A former partner of Mr. Momsen, William Cressy, is now serving time for fraud as a result of his connection with several employment schemes.

Extreme caution is suggested in any case where a job is promised but where a fee must first be paid. Most such concerns seem far more interested in getting the fee than they do in supplying work.

* * *

Fraud Orders

The Post Office Department has issued fraud orders on two concerns about which many subscribers have inquired in recent months.

The first one is the Quality Dress Co. of New York City. This concern advertised for women to "earn \$18 a dozen sewing dresses at home." Those who answered received a form letter requesting \$2 for a working outfit and instructions, and received in return 2 1/2 yards of cloth, some trimming and instructions for making dresses. Buyers in several large department stores stated that completed dresses made of material similar to that sent would sell at retail for about \$2. The promoter was unable to name any person who had earned any money by this scheme.

The second concern is the Royal Products of Brooklyn. They advertised for women to address and mail premium catalogs. On receipt of \$1, would-be workers received five catalogs, five envelopes, five 1 1/2c stamps, 10c in cash, and mailing instructions. They were advised to send the envelopes to friends. Unless orders were received from those to whom catalogs were sent, no further "home work" was received by the home worker.

If any of our readers know the present address of Mr. Louis Boisvert who was living in Keene, New Hampshire, we would appreciate the information. We would like to get in touch with him.

TWO SISTERS —Only One Protected

Mrs. Fernald

Their fine, new car left the slippery highway, crashed into a tree, and two more happy young women entered the unknown.

Mrs. Saris

Only a few months ago Mrs. Fernald renewed her policy and asked our agent, Mr. Rumphrey, to call on her sister. He was on his way to see Mrs. Saris when he learned of the accident.

PART OF MR. FERNALD'S LETTER

Gentlemen:

I have received your check for \$1000, payable on the \$1 policy which my late wife had taken out. You had already paid her a claim of \$30 in connection with an accident which occurred in August, 1938.

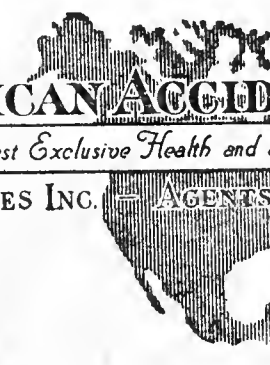

I received the check within three weeks. I am very grateful for your quick service. While the loss of my wife was a terrible thing, this financial aid was a great help.

I feel that no one should be without this low cost protection.

Nottingham, N. H. (Signed) WILLIS FERNALD.

The thick growth of young grass and clover on this range will provide valuable vitamins and proteins.

Pullets on Range

Anyone who is handy with tools can build this portable shelter for 100 to 150 birds. Cornell Extension Bulletin No. 280 gives complete building directions. Wire sides and floor are sanitary, and protect the pullets from enemies.

THERE'S MORE than a little truth in the old belief that growing chickens should be allowed to "get their feet on the ground" as early as possible. Good pullets can be raised in total confinement, but nothing can beat the combination of fresh air, green feed, sunshine, and exercise for growing big, firm-fleshed well-developed healthy birds.

Little chicks can be allowed to run out of the brooder house within a few days after hatching if it is warm enough. Pullets can be put on the range in shelter houses without heat at six to eight weeks depending on the weather.

Choosing the Range

Give the pullets all the room you can—an acre for every 500 to 700 birds if possible. It is best to select a site where chickens have not been reared last year, and as far as possible from the old birds, to prevent the spread of infection. Range should be high and well drained, with a good stand of grass, clover, or alfalfa. Many poultrymen prefer a range with some trees or a hedgerow to provide shade; others feel that shady spots may harbor parasites, or weasels and skunks.

Separate Pullets from Old Birds

Never permit the old and young stock to mix on range, for old birds may infect the growing pullets with disease. If the same man tends both old and young stock, it is a good plan for him to change his rubbers or shoes before going from the old stock to the pullets, in order to avoid tracking infection to the pullet range. Feeders or equipment that have been used by old birds should be thorough-

ly disinfected before they are used for the pullets.

Good Pasture Saves on Feed

Good green pasture provides most of the vitamins and some of the protein that pullets need for growth. A good pasture will grow 2 or 3 tons of dry matter per acre per year, containing 20% to 30% protein. To provide the greatest feeding value, the grass should be extremely dense and leafy and should not be permitted to exceed 4 inches in height at any time. Lime and superphosphate may be needed to get good growth. Cut the grass frequently to give the birds fresh leafy green feed. The older dry grasses have little feed value, and usually the pullets won't eat them.

Shelter

Pullets on range need protection from the heat, from storms, and from their natural enemies. Simple range shelters with roof, wire sides, and wire floor can easily be constructed to house about 125 pullets in a 10 x 12 foot space. Shelters should be placed at least 150 feet apart on the range so the pullets will have plenty of room to exercise. If there is natural shade on the range, place the shelter houses within 25 or 30 feet of the shade.

This simple outdoor feeder keeps the feed dry. It is easy to build, easy to fill and clean. Cornell Extension Bulletin No. 373 tells how to build it.

Small steel traps placed on tall poles near the shelters will help protect the pullets from hawks and owls.

Keep Things Clean

Thoroughly clean range houses before pullets are placed in them. All roosts should be removed and painted with G.L.F. Red Mite Killer or Carbolineum, brushing it into every crack and crevice. All wood adjoining the roosts should be thoroughly painted. This prevents red mites getting a start in your range shelters or brooder houses. Moving shelter houses several times a season will help avoid serious soil contamination.

Eating and Drinking Space

Pullets need plenty of room to eat and drink and plenty of good feed and water to make steady growth. After they are 8 weeks old, pullets should have at least 2 inches of hopper space per bird. Large feeders put right out on the open range and covered so that the rain won't get into the feed are a convenient way of feeding. However open hoppers are usually satisfactory except in case of a prolonged downpour. Some poultrymen prefer to scatter the grain on the ground, so the birds will have to move around to eat it. Fresh water should be provided at all times in large sanitary fountains. Fountains should be rinsed or brushed out daily. Piping water to the range is an expense but it saves a lot of work and is well worth while when help is limited.

Feed Liberally

Keep the pullets supplied with plenty of fresh feed. If both scratch grains and mash are kept before them, they will eat the proportion that best suits their needs. At

twelve weeks they should be eating about equal parts of grain and mash. It is a mistake to rely too heavily on grain to bring pullets through the growing period. Most of the vitamins and proteins they need must come from the mash. G.L.F. Starting & Growing Mash is carefully balanced to give growing birds a variety of animal and vegetable proteins, and to provide an abundance of all needed vitamins and minerals. Green feed and sunshine are valuable as a supplement to the mash, but rapid sound growth calls for liberal mash feeding. G.L.F.

This float valve feeds water into the drinking pan as needed. Pan should be placed on a wire-covered stand to prevent wet spots around fountain.

Starting & Growing Mash, plus grain and grit, will keep the pullets growing.

When They Begin to Lay

Pullets should be moved to laying houses when production has reached about 5%. Some poultrymen place pullets in laying quarters as they begin to grow combs, leaving the slower maturing birds on range for further development by themselves. As soon as they are accustomed to the laying house and before they reach heavy egg production, switch them gradually to one of the G.L.F. Laying Mash.

AMERICAN AGRICULTURIST

FIVE YEARS FOR \$3.00 — THREE YEARS FOR \$2.00 — PUBLISHED EVERY OTHER WEEK

THROUGH THE Dean's Window

By CARL E. LADD

Dean, New York State College of Agriculture at Cornell.

I JUST LOOKED out the window and saw Douglas hurrying by looking happy and busy, a good student from a good farm. He thinks that new bright colored coat is the latest thing in college clothes, and it is, but he doesn't know that his father and I each had one almost exactly like it twenty-five years ago and we were just as proud of them. It is true that such coats have been out of style all through Douglas' lifetime until their resurrection during the past four years, and I am reminded that there are cycles in students' clothing as well as in other things.

Douglas is six inches taller than his father, but the father, Bob to me, had a little harder time. He was raised back in the poor land of an eastern county, and worked as a hired man for six or eight years before he could start in college. High school had been pretty sketchy for Bob and he had to enter college as a special. Some of the work was pretty hard for one lacking good high-school background and I suspect that Bob's class grades were disappointing to him. But his teachers saw something beyond grades and Bob's sincerity, energy, and practical common sense made it possible for him to get more out of college than some of his better-prepared companions. Well, Bob started with less than nothing and today he owns two farms, but prosperity has not made him selfish. He is a leader in the community, a fine husband and father.

I wonder if Douglas' extra six inches come partly as a result of better feeding?

I think Douglas is headed towards those farms back home. Some way I hope he won't take a salaried job in government work or elsewhere. The home county needs him and others like him. There he will not be just a cog in a big organization but an independent, free individual, a competent husbandman on an excellent farm with every opportunity for giving ser-

vice to his county and his State through farm organizations. Do you suppose this big strapping Douglas has the tough fiber that his six-inches-shorter dad has? Can he stand the punishment and win through in a hard grueling fight? If you knew how Bob and Mrs. Bob have raised their family, how they have all lived together and shared each other's thoughts and hopes and disappointments, and ideals, you wouldn't have much doubt about Douglas.

There coming through the doorway is a little chap, Louis, with the mark of the city on

him. How happy he looks. Yesterday he fairly glowed when he told me how well he likes this place. I didn't know his father and neither did he for he is an orphan. He has held a city job and supported himself for several years since graduating from high school. Last winter when he first came to my office and expressed his desire to study agriculture, I feared he was making a bad mistake. With no knowledge of farming, no experience in the country, no country background anywhere in his family history, there was every chance that after four years in an agricultural college he might find it all a tragic mistake.

When we said, "Go work on a farm as a hired man," Louis said, "no," he saw no reason for doing that, he wanted to enter college at once. We stood firm on farm practice and finally Louis agreed. Out in the State some distance from the college is a fine farmer and his wife, without children of their own but almost foster parents to a long line of boys who have gone to them for farm experience. Louis arrived at their home direct from Broadway some time in the spring. Two months later, I had a letter—Louis liked the farm fine. A month or two later I saw the farmer—he liked Louis fine.

Now, after six months of excellent farm experience Louis is in college. He is still under a handicap compared with farm-reared boys, but some way, I'm betting on Louis! His sincerity, his genuine happiness on the farm, his delight with college, and his excellent scholastic record sound like a good contribution. Only time will tell, but anyway Louis is on his way and enjoying the journey.

Just before noon Ben dropped in to talk a minute. I didn't know his family, but through a discussion over entrance, had met Ben and his father. A friendly, "Drop in some time and tell me how you are getting along," had resulted in two delightful, frank visits during the first semester. "High school was easy enough, but I just can't get chemistry. Maybe I let (Turn to Page 18)

**U. S. SUPREME COURT
Decides FOR DAIRYMEN
in Milk Marketing Case**

— SEE PAGE 4 —

FOR LATEST INFORMATION ON JAMS AND JELLIES—SEE PAGE 20.

NOW—It's up to the Farmers Themselves to get A LIVING PRICE FOR MILK

For five months last winter the farmers in this milkshed had the right to set the price on their milk. And in every dairy farm home there was rejoicing.

During those five months a great many farmers learned that the real answer to the milk problem is **CONTROL OF THE SURPLUS**. When the farmers controlled the surplus they received good prices. When control of the surplus was given back to the dealers, milk checks hit bottom.

We all know that the quickest way for us to get **A LIVING PRICE FOR OUR MILK** is with Federal and State orders. But these orders merely give us a chance to control our surplus. And we must all learn there is **NO OTHER ANSWER TO THE MILK**

PROBLEM except keeping control of the surplus in the hands of the farmers. We must realize—all of us—that when we keep surplus milk from the chiseling dealers we can get a good price for our milk.

For twenty years, Dairymen's League members have fought this fight for **ALL** farmers. For twenty years, we have been opposed by the **SAME** Anti-farm Gang. We have been abused, misrepresented and lied about. But the fight has always been the same—**SHALL FARMERS OR DEALERS CONTROL THE SURPLUS?**

Farmers know **NOW** what they can do when they stick together. Farmers know **NOW** that with or without government help the job is **STILL A JOB FOR FARMERS TO DO THEMSELVES**.

Grange GLEANINGS

By CHARLES M. GARDNER

Editor of the National Grange Monthly and High Priest of Demeter of the National Grange.

TORRINGTON Grange in Connecticut, located just outside the city of Torrington, is very proud of one of its members, Mrs. Jennie Sawyer, who has the distinction of being the only woman in the United States who is a licensed sea captain. A former husband was captain of his ship for many years and at his death she succeeded to the responsibility and carried it for a considerable period. Mrs. Sawyer is now the wife of the village pastor at Torrington and both she and her husband are very zealous Grange workers.

THE ANNUAL meeting of the National Grange Mutual Liability Company at Keene, N. H., held May 15, showed 12 months of unexcelled prosperity for what is one of the established Grange institutions of the United States, insuring Grange members only and officered entirely by Patrons. The company's assets at the close of the year were \$1,858,648.17, as against \$1,518,231.48 at the beginning of the year. The net premiums written for 1938 showed an increase of almost \$200,000 over the previous year, while the policyholders' surplus for the year increased almost \$100,000. The company was organized more than a score of years ago. Out of an office force of about 125 employees nearly every one is a member of the Grange and takes an active part in the work of Cheshire subordinate at Keene.

* * *

THE CHAPLAIN of the Maine State Grange, Rev. Royal Brown of Old Town, has recently been obliged to submit to a serious surgical operation, from which he is convalescing. Mr. Brown is a very popular State Grange officer and much in demand as a speaker at meetings throughout the state.

Victory and Justification

BY VOTE of almost two to one the New York State Legislature passed the Nunan milk marketing bill, which corrects the defects in the Rogers-Allen law, and permits the dairy organizations and the state to restore the milk marketing agreement strictly within the state.

Now, just as we go to press, comes the decision by the United States Supreme Court, the court of last resort, completely reversing Judge Coopers' decision against the Federal marketing act and the milk marketing agreement and approving the Federal marketing act and the milk marketing agreement set up under this act.

This decision is tremendous in its importance because it affects not only the dairymen of New York state, but every dairyman in the United States. New York was the only place where a lower court had decided against the milk marketing agreement, but had the Supreme Court agreed with Judge Cooper, milk marketing agreements in New England, and in other milk sheds of America, would have been thrown out.

Thus, dairymen and their organizations again have won a great victory and a complete justification in their fight for a living price for milk.

American Agriculturist is proud of the fact that we have worked side by side with the large majority of dairymen to help bring about this victory.

In 1933 New York State passed a State milk control law to fix prices. *American Agriculturist* supported this plan for a while because it resulted temporarily in higher milk prices to farmers. But State milk control failed and was discontinued on March 1, 1938, because it could not control outside or intrastate milk. In its place the Legislature passed the Rogers-Allen law, which did two things: first, it gave milk cooperatives the legal right to work together, and second, it made it possible to put in Federal and state marketing agreements on the request of a big majority of producers.

Under the first provision of the Rogers-Allen law, two bargaining agencies were set up. The larger was the Metropolitan Cooperative Milk Producers Bargaining Agency, composed of over 75 milk marketing cooperatives, both large and small, serving metropolitan New York. The second was the Niagara Frontier Bargaining Agency, composed of most of the cooperatives selling milk in Buffalo. These two bargaining agencies were successful during the first few months of their operation in putting prices to farmers up and keeping them there, well above the general price level of all other farm products. Eventually these prices declined for the same reason that milk control failed, namely, the Bargaining agencies could not control intra-state and unorganized milk.

Then the dairy farmers and the two bargaining agencies invoked the second provision of the Rogers-Allen Law, and asked the Federal and State governments to ask dairymen to vote on federal-state marketing agreements. Dairymen shipping to New York City responded with a vote of 86% in favor, and dairymen shipping to Buffalo with a vote of 92%, whereupon milk marketing agreements were put into effect. In the face of less demand, more production, and a falling general price level, milk prices rose sharply above the general price level, and stayed above until Judge Bergan in State court and Judge Cooper of the Federal District Court invalidated the Rogers-Allen law and the milk marketing

agreements. You know what happened. You know where milk prices are now.

In New England the same kind of marketing agreements were in effect, and approved by the lower courts. As a result, New England milk prices are much above New York milk prices, (base price for April in Boston market was \$1.65) and above the general price level of farm products.

Dairymen now have the unquestioned authority to restore the marketing agreements in the New York milk shed, and this will be done as soon as it is practically possible. It is now up to all of us to let bygones of controversy be a thing of the past and to unite 100 per cent to work out injustices and inefficiencies in these marketing agreements, and use them as an effective means of bringing about a living price for milk.

Congratulations to Secretary Wallace

SECRETARY Henry A. Wallace of the United States Department of Agriculture is to be highly commended for the policy he has announced for maintenance of the independent position of the Farm Credit Administration (See Kernels, Screenings & Chaff, Page 26).

Acting under the grant of power recently given him by Congress, President Roosevelt issued a consolidation order which among other things placed the Farm Credit Administration in the Department of Agriculture, and gave the Secretary blanket powers for carrying on the work of Farm Credit. Largely because of the independent position of Farm Credit Administration, and owing to the fact that it is at least partially cooperative, farmers owning a part of it, the Farm Credit Administration has been highly successful in aiding hundreds of thousands of farmers when they most needed help. Because of this, farmer borrowers and leaders of farm organizations of America were much worried over putting Farm Credit into Agriculture, and emphatically objected.

Secretary Wallace then issued a very statesmanlike announcement saying in effect that it would be his policy not to change the Farm Credit Administration in any way, and that the only difference there would be in the new set-up would be that the Governor of the Farm Credit Administration would report to the Secretary of Agriculture instead of directly to the President as he had heretofore.

There Are Not too Many Eastern Apples

BACK from a two day trip through the fruit sections of western New York, I am again impressed with the future farm possibilities of this fine section, and with the fact that there is a future for good apple growers in the Northeast.

Years ago, when the editorial offices of *American Agriculturist* were located in New York City, I used to wonder why I never could buy anything but western apples at the fruit stands or in the stores. I concluded that there were two reasons: one, northeastern growers hid the qualities of the finest apples in the world in a too large package—a barrel. These barrels went to bakeries and seldom got to the fruit stands or even into the retail stores.

Another reason was that we never advertised the quality of our eastern apples, while the western growers always did. The result is, we lost the best part of our markets right under our noses.

When I began to talk about a smaller package for apples, many of my grower friends laughed at me, said it was too costly and not practical. But now I am glad to say the smaller package has come to the East and come to stay, and also, through the efforts of the New York-New England Apple Institute, we have made a small start in telling the world about the quality of our eastern fruit.

One of my friends on the recent trip said to me:

"We haven't too many apples; in fact, we need more apples of better quality to crowd the others off the market."

My friend also said:

"The market, the market, the market! That's the thing we eastern growers must emphasize more in the future."

That is right! When we put these better apples in smaller packages, and organize to advertise and market them, the northeastern apple industry will be going places again.

No European Tour

WE ANNOUNCE with great regret the cancellation of our proposed European tour. Owing entirely to the fact that people who otherwise would plan to go have been scared off by newspaper headlines on the European war situation, only a few have made reservations for this fine trip. So there is not a large enough party to make it worth while this year.

That the war situation is the main reason is proved by our correspondence and by the fact that 100 people went on the *American Agriculturist* tour this spring to the Pacific Coast and the Golden Gate Exposition. In fact, we had to return some of the late reservations because the party was getting too large. We hope that those who have expressed interest in our European tour will keep the matter in mind and go with us at a later time, if and when the disturbing situation in Europe calms down.

Eastman's Chestnut

THE COUNTRY is filled with old stories about the slowness of hired men. Some time I hope the hired men will come back with some good ones on the boss. If they do, they will have my sympathetic attention.

Here's a hired man story for which I am indebted to J. D. Secord of Franklin in good old Delaware County, New York:

"An elderly farmer and his wife had a hired man named Hiram, who was a dependable fellow, but he had the reputation of being the slowest man in the county, the kind of man people used to call 'mortal slow'. One morning after breakfast, the old farmer sent Hiram to look over the pasture fence on the far side of the farm, and see if there were any places that needed mending. The old farmer sat down to read the paper, and his elderly wife sat in her favorite rocker near the window. Finally she said:

"There goes Hiram across the meadow."

"Yes", said the old farmer, and went on reading.

"About five minutes later she said, 'There, Hiram is going to climb over the fence.'

"Yes", said the farmer, and went on reading.

"A minute later she said, 'Hiram is climbing over the fence.'

"Yes", said the farmer.

"Suddenly she cried out in alarm, 'Hiram has fallen off the fence.'

"Well", said the old farmer, 'has he hit the ground yet?'"

How Big Is a DOLLAR?

What it will Buy is the Best Measure . . . A Definite Amount of Gold is the Poorest

By Frank E. Gannett

A FEW GENERATIONS ago three-fourths of our population were farmers. Even today, almost one-half of our people live on farms or in small communities. Their income depends upon prices received for farm produce.

When the farmer, the miner and the lumberman receive good prices, they are able to buy. Industry then booms, workers get wages. As farm prices fall, industry lags.

Since 1929 farmers have been in the worst depression in history. More than one and one-half million farmers have lost their homes, their life savings. Prices were so low they could not buy what they needed for home and farm.

Frank E. Gannett

To prevent such a drop in prices, we need more stable prices for raw materials, a dollar that will buy the same average quantity of wheat, wool, cotton, meat, today, tomorrow, next year, one hundred years hence. Though no gold dollars are now coined, our dollar is tied to gold, Congress and the President declaring it to contain or be equivalent to a certain number of grains of gold. But gold, like any other single commodity, fluctuates in value, according to the law of supply and demand. Hence our dollar is unstable and prices go up and down as the value of gold rises or falls.

Why did the discovery of gold in California cause a great rise in prices? A bushel of wheat brought more gold. The wheat wasn't worth any more. It didn't feed any more people, but the gold which measured its value was increased in volume and so cheapened, that the wheat brought in exchange its proportionate share of more gold.

Why did the panicky hoarding of gold following 1929 cause a fall in prices? A bushel of wheat had really the same value. It would feed just as many people, but the available gold by which its market value, its price, was measured, was less in volume and the bushel of wheat brought in exchange its proportionate share of that smaller volume—hence a lower price. Yet through all these changes, a bushel of wheat brought in exchange about the same quantity of wool, cotton, corn, meat.

In the three years between 1929 and 1932, the great demand for gold made it so much more precious that its value rose two and one-half times. Thus the farmer who had exchanged 20 bushels of wheat during the '20s for an ounce of gold, now had to grow 50 bushels to get the same amount of gold. That is, instead of one dollar a bushel, wheat was 40c a bushel. Instead of 200 pounds of lard, the farmer had to give 500 pounds for an ounce of gold. Or, stated otherwise, lard dropped from 10c a pound to 4c. Cot-

ton from 23c to 8c a pound; butter from 35c a pound to 14c.

It wasn't overproduction that did this, for we were producing even less than we had produced and consumed the previous ten years. The change was in the commodity value of gold. Because Congress did nothing to offset this, farm income dropped from 12 billion dollars to 5 billion dollars in 1932.

I spent my early years on a farm and so know what has happened to the farmer. As I drive through the country, I am appalled by the change.

Last year I wrote 59,000 leaders of cooperatives, farm bureaus, and officers of granges. The replies tell the story.

Mr. Simon, secretary of a western Farm Bureau says: "In my township 8 out of 46 farm homes have been abandoned since 1929 and more will be abandoned within the next 3 or 4 years."

The secretary of a Grange in North Carolina writes: "A fair chance for everybody is all farmers ask. If we could have living conditions even of the poorest town people, our boys would stay here even if hours are long and work hard. We carry water 200 yards because we have no money to drill a well through rock. Yet we love farm life. It gives us freedom, peace, contentment found nowhere else."

The wife of a farmer near Gainesville, N. Y. writes: "I pray America will awaken to the farmers' plight soon enough to save our homes, our farms and our families."

General Wood, president of Sears-Roebuck, speaking to the American Farm Bureau Federation, showed that while farmers' gross income fell from 12 billions to 5 billions, his company's sales to farmers dropped from 240 millions to 100 millions. This meant loss of profits, shorter hours, reduced wages, lay-offs and finally unemployment for tens of thousands.

When this young fellow gets to farming, a can of milk or a crate of eggs will feed as many people as they did when grandfather started farming. How much will they sell for? Nobody knows, nor will they know unless we get a managed currency. We hope the young fellow doesn't buy a farm when prices are high and then try to pay for it with milk at \$1 a hundred.

Because of my interest in the studies of this price problem started by Dr. George F. Warren at Cornell University, I had a chart prepared which I shall be glad to send to any one. It is based on the figures of the Department of Agriculture and the National Industrial Conference Board. It shows that, step by step, as gold demand rises and the buying power of the dollar goes up, farmers' prices and income go down. It shows that farmers and basic producers during the ten depression years since 1929 have lost 50 billions of dollars of normal income. This loss of purchasing power to one class in ten years exceeded our gigantic national debt by ten billions of dollars.

This purchasing power destroyed by a derangement in our money, is holding this nation down. Before city business can give full employment, with jobs for all and opportunity for youth, farmers buying power must be restored. Without this, free enterprise will cease.

Farmers know the facts. But city people also should heed. Ten million men, more than 26% of all gainfully employed, work on farms. Yet, after deducting cost of fertilizer, implements, taxes, these owners and hired workers have remaining an average of only \$500 a year. Deducting the food consumed on the farm, counted as money, only \$1.30 a day in cash wages remains for the average farm owner and his hired man, and nothing for interest on 50 billion dollars invested in farms. Nothing for the unpaid labor of 22 million farm women and children.

No subsidies from the Treasury can make good a yearly shortage of 5 billion dollars resulting from low farm prices. Restore prices to a fair level and farmers will get four to six times more than the total benefit payments of the New Deal.

Britain, wisest in the world in money matters, and the 20 other nations (Turn to Page 9)

Shell Live Stock Spray acts like Tear Gas on Insects

DAIRYMEN and other livestock breeders asked Shell for five major points in a spray. First, it must kill insects in the barns; second, it must repel them in the pasture; third, it must not irritate the stock; fourth, it must be stable; fifth, it must be economical.

That spray is ready for you now — Laboratory-tested thoroughly and during the past three years proved on thousands of farms, Shell Livestock Spray gives you every advantage you could ask:

It kills insects — doesn't merely stun them.

It repels them — they won't come near it.

Properly applied it will *never* irritate the hide, nor cause loss or matting of hair.

Keeps its strength, stays active for hours after spraying.

And you will find it costs you no more than ordinary sprays. Watch it increase your milk output and keep stock in better condition by its power to relieve them of the worry and discomfort of insects. Available in all sizes from one quart up. Order today from your Shell dealer or the nearest Shell depot.

PLUS VALUE OF ORCHARD BRAND ARSENATE OF LEAD GIVES YOU PLUS ACTION!

APPLE BILL says: "You get double-barrelled action when you use O. B. Lead"

Recent improvements made in Orchard Brand Arsenate of Lead give it *plus* value . . . *plus* action.

What do these *plus* advantages in Orchard Brand Arsenate of Lead mean to you as a grower? Here are a few of the advantages:

- 1. QUICKER KILL**—Worms are quickly killed before they can sting or enter the fruit surface.
- 2. BETTER COVERAGE**—Bare spots are reduced in number by the more closely knit, more uniform coverage on the fruit.
- 3. CONSISTENTLY HIGH "GRADE A" PACKS**—The marked reduction in the cull loss means lower handling or production expense, higher quality fruit, and consequently, greater net return.

Orchard Brand Arsenate of Lead leads all others in sales and performance. Its leadership has been built up by many years of consistently high orchard results . . . proving its quicker and more thorough-acting qualities. This high control efficiency is now evidenced to an even greater extent through improvements in the physical properties. Its flake-like particles, which tend to overlap, reduce the number of bare spots in the spray cover and provide more thorough protection. Write for additional information.

Going Once, Going Twice, **SOLD!**

By ED. W. MITCHELL

THAT is the old, familiar cry of the auctioneer. If we do not want to hear it ring out as a lot of our apple farms are sold at foreclosure sale, we had better take some steps to make it ring out as we move this next apple crop.

Ed. W. Mitchell

With a big apple crop in 1937-8 and a small one in 1938-9, we failed both times to measure demand and price in such a way as to market the crop to best advantage. The apples we sold cheap or gave away at a loss at the end of the season might better have been disposed of that way publicly and at the beginning of the marketing season to create consumer demand. Prospects indicate a bumper apple crop in 1939. To protect our investment in its production, we had better start right now to plan and work on a practical marketing program.

What Apples Cost

From the Cornell economists and our own records we can get costs of production and average sale prices. That is some guide as to what our commodity costs us and brings in return. The New York and New England Apple Institute is our advertising agency to create consumer demand. Rasmusen's market report gives us a good idea what to offer on the market and where to find the best outlet for each class of fruit.

But, unfortunately, no one up to this time has been able to devise any practical way to make the grower throw out the poor apples that should not go in the package with the good ones, or that should not go to market at all; and no one can force us to spread our deliveries over the marketing season to best advantage. We all want to hold for the high price, and it naturally follows that most of us miss it.

We can get a fairly close estimate on the total commercial crop by the first of July. We can look over the records and find about what part or percentage of the total should move each month to come out even at the end. Any one of a number of agencies will get that "dope" for us. But how are we going to measure or know what is a *fair price* for this year's crop?

That fair price will be determined by the world supply and demand for gold and the supply of and demand for apples. We have a report on the commodity price index each month, and will have an estimate on the supply of apples by July or August, but how are we going to measure that last, unknown factor — DEMAND.

I can think of only one way, and experience has shown it to be a pretty good one — AUCTION SALES.

Auction Advantages

The auction method of selling brings certain advantages to both seller and buyer that cannot be had through private sales. The eagerness of the bidding and the price give an immediate measure of demand and value. The publicity given the prices acts at once to correct errors of judgment for both buyer and seller, and helps to prevent distributors from taking an unfair margin of profit because the consumer can easily find out the wholesale

price. A bargain price at an auction brings an immediate rush of buyers to the next sale, which will automatically readjust prices upward. A high price calls out a more generous supply of goods for the next sale, which acts as a guard against holding back supplies too long. At an auction all the buyers are bidding in competition for the one item being offered; at private sale all the sellers are bidding at one time with their produce for the dollar of the single buyer at the counter.

Compared to the auction method of selling, the system of private sale is a slow, tedious, inefficient way to establish values and effect sales. Everybody is working in the dark and lacks that confidence so necessary for business activity. Produce may or may not find the buyer for whose trade it is best suited, and the buyer and seller both suffer as a consequence.

Gradual Sales

We all know and are willing to admit that a large volume of uniform goods sells better at auction than small lots of varying grades. The same is just as true with private selling. We know that our method of distribution and sale cannot be changed over night, or in one season. But here is a very practical thing we can do, and I hope some leadership will take it up and put it across this season.

Every apple grower can determine or agree that a certain minimum amount or percentage of his crop will be moved every month throughout the marketing season, and that a certain minimum amount will be offered at auction every week. Whether we use any figures of crop estimates and past marketings as a guide or not, the average opinion of many growers as to the amount to move at any one time will be better than the blind hunches we have used in the past; and this method will do two things.

It will maintain at least a minimum flow of our commodity throughout the season, and it will give us and give our buyers some idea of demand and value that only auction sales can give.

If we are to obtain those two great benefits, there is a certain price we must pay, and a certain condition to which we must agree. *We must sell regardless of price.* That may be a bitter pill to swallow, but it is the only way to get results. This is where the AUCTION method of selling can be of the greatest benefit to the growers.

If apples sell far below their value

"MILLIONS OF DOLLARS SPENT TO BRING THESE EXHIBITS HERE - AND YOU WANT TO RIDE A MERRY-GO-ROUND!"

SPECIAL \$1.50 "Feed Saver" Hopper for 59¢

**With Your Order
of 5 Bags of
Growena or Growing
Chow, Taken Out
as Needed!**

JUNE is National Pullet Improvement Month. State Colleges, Vocational Agriculture groups, farm and poultry organizations everywhere have set aside the month of June as a month devoted to the growing of big sturdy pullets, ready to lay lots of eggs next fall.

In order to tie-in with this great nation-wide movement, Purina Mills has arranged to help poultry raisers in solving one of their biggest problems during the growing season — that of providing increased feed hopper space. From May 15 to June 30, Purina dealers throughout the country are offering the famous Purina "Feed Saver" Mash Hopper for only 59c, with the purchase of 5 bags of Purina Growena or Growing Chow, taken out as needed.

This hopper sells regularly for \$1.50. Its sturdy, all-metal construction makes it far superior to poorly designed and cheaply constructed hoppers.

See your Purina dealer today for your supply of Purina Growena, the complete growing feed, or Growing Chow, the mash that goes with your home-grown grain. And don't forget to get your "Feed Saver" hoppers while you're at the Purina dealer's store.

WHAT DO I REALLY WANT?

I WANT CHARACTER AND AN
ABUNDANT LIFE!

OFTEN by our actions we choose to shun life's fundamentals — set them aside for a later day when we are so badly in need of them today. We vote for weakness when God could give us strength. We admit froth and folly into our living when He offers us hope and happiness. We tolerate minor things when He could bring us First Things.

■ ■ ■

Do You Want God?

HE is very near . . . in that neighbor down the road, in your home, in your sewing circle, in a schoolmate. He will come into your life, too, just as soon as you open the door. He will fill your life with unbelievable happiness — not only on Christmas or on Sunday, but every day. He will help you discover what life has in store for you when it overflows with truth and beauty.

Which Do You Want?

ABUNDANT LIFE
(These build up)

Absolute honesty
Truthfulness
Clean thoughts, speech and conduct
Living at my best—"My own self at my very best, all the time."
Faith in God

LIVE TALL
or
SINKING SOULS
(These tear down)

Cheating
Lies
Smutty stories, foul language
Selfishness
Mind closed to the unseen

■ ■ ■

All these thoughts are only suggestions. You and you alone can decide what it is you actually want in the days ahead.

The decisions you make within yourself will be the things that really count . . . decisions that stir you to Action . . . and all to make life more interesting and more adventuresome and more abundant.

Your wants are yours. May they be realized!

If my 12-page WANT pamphlet will be helpful to you, you may have a copy by sending a 3c stamp with your name and address.

"CRASH"

Go Milk Prices!

*With Marketing Order in Effect April
Price Would Have Been About \$1.50*

By HOLTON V. NOYES,

Commissioner of Agriculture and Markets, State of New York.

NEW YORK State dairymen received only 95 cents to \$1.05 per hundred pounds for their April milk. Such prices are ruinous to the entire farming industry of this State and unjustified regardless of the surplus which may be available.

These distressing prices should convincingly prove to the dairy industry of this State the necessity for:

- (1) The reestablishment of regulation of the industry.
- (2) The necessity for regulation of production.
- (3) The necessity for willing and complete cooperation.

The present crash in milk prices is due, in my opinion, to two causes: suspension of the federal and state marketing order and an abnormal surplus. Government regulation under the marketing order was in effect from September 1, 1938 to February 1, 1939. During that time prices received by farmers were in general satisfactory.

The downward trend in prices became apparent almost immediately following invalidation of the order by a court decision. At the present time the average price received by producers who deliver to milk shipping stations is probably lower than could be realized if the milk were manufactured into cheese, butter or condensed milk.

Lost Fifty Cents a Hundred

This situation is simply ridiculous. It illustrates most emphatically to my mind the absolute necessity for control of some kind. If the invalidated order had been in effect during the month of April, the price to farmers would have been approximately \$1.50 per hundred instead of one-third less than that amount.

I use this figure advisedly because our department statisticians have made a careful computation to determine what the price would have been with the order in effect. Allowing for all factors in the market and using the schedule set up by the order itself, they have agreed that the \$1.50 figure would have been the approximate price for this month.

While \$1.50 a hundred for milk even during the flush period is not satisfactory, it is certainly vastly better than 95 cents. The difference between the price the farmers would have received under the order and the price they are actually receiving under so-called free competition will run into millions of dollars. All business in the State will feel the adverse effects of this curtailed income. The prospect for May is certainly not any better unless stability can be restored in this industry.

It would seem to me that if there are any dairymen in the State who have heretofore questioned the necessity for regulation of this industry the experience of the past few months as against the period under regulation should once and for all convince them of the unsoundness of their objections.

Production Has Been High

But the situation, as bad as it was with the demoralization following suspension of regulation, has been aggravated by an abnormal production

running nearly ten per cent above the five year average.

I have several times pointed out the necessity for the industry to consider some regulation of production. If every improvement in price is to be followed by increased production to take advantage of the better price, then all our efforts to stabilize the market and assure a fair return are constantly endangered by unregulated production which may flood the market and destroy all the advantage gained by price regulation.

This is a subject which must receive increasing attention by the industry if we are to make any substantial and permanent progress toward placing the milk business in this State on a sound foundation. Whether this regulation will be voluntary or official is for the industry to determine. That it is daily becoming a serious phase of the problem is quite apparent in the present situation.

Cooperation Essential

Finally, as to the need of cooperation. It should be remembered that no regulation, whether official or voluntary, can be effective without a willingness on the part of all groups in the industry to cooperate. The present chaos resulting from the suspension of the marketing order and abnormal production have both resulted from an unwillingness to be genuinely cooperative.

At the time the marketing order was adopted there was apparently 90 per cent agreement to it. It seems to me that a very considerable responsibility rests on those who were instrumental in breaking up the order. If it was a good thing for the farmers, but was defective in a few respects, we should have been able to find a way to correct these defects while still keeping the order in effect and thereby avoiding the necessity of a long period of invalidation. Certainly both the federal and state governments have done their part. The failure to cooperate has been by some groups in the industry.

The ridiculous and ruinous prices now being received by New York State dairymen represents in reality the price they themselves must pay for the inability of their own industry to agree.

Dusting potatoes on the Harold Simonson farm, Glen Head, Long Island, for potato beetle control.

LONG ISLAND to Revive Potato Tour

AFTER a lapse of seven years, Long Island is reviving its famous potato tour on June 21 to 23. The season on the Island has been late, but it is expected that by that time the crop will be sufficiently advanced to make a good showing.

The tour will start from the Farm Bureau office at Mineola on Wednesday, June 21, at 9:30 A. M. On Thursday the tour will start at the State Institute of Applied Agriculture at Farmingdale.

During three days 12 farms will be visited, including combination potato and vegetable farms, specialized potato farms, and one duck ranch.

For the benefit of those who wish to attend the World's Fair, accommodations and lodgings are available at the State Institute of Applied Agriculture from June 18 to 21. Reservations can be made at the Nassau County Farm Bureau, Mineola, N. Y. For a program of the tour, write W. G. Been, Riverhead; or H. H. Campbell, Mineola.

How Big Is a Dollar?

(Continued from Page 5)

which base their money on the British pound, recognize the importance of maintaining commodity prices. Instead of restricting production, they help their farmers by controlling the amount of gold the pound sterling represents. The price of gold in London changes almost daily. Australia, New Zealand, Denmark, Finland and 15 other nations basing their money on the pound sterling, have lessened the amount of gold in their currencies. So it is that they get no more gold, but in their money they get 30% higher prices for their products than the American farmers do. As a result, while we plowed under cotton, losing world markets, Brazil increased cotton production four-fold. Argentina posted signs, "Farmers, your day of opportunity is here. Grow more wheat, grow more cotton."

The governments of these nations, working with Britain, prevent wide fluctuation in their measure of value caused by changes in the value of gold. These nations having a stabilized currency, enjoy high employment, high building activity, generally balanced budgets, with no such mounting debt as threatens us with bankruptcy.

There is nothing new or untried in this monetary system. 21 nations with a population of 600 millions, some with 10 years' experience, have shown the way. We need only to place the right men in charge to put it in effect here.

Of all groups in the United States, the farm organizations began in 1926 to demand the managed currency policy which Britain, wisest banking nation, has used as the foundation stone of recovery for herself and 20 other nations.

The renewed demand for an equally safe and honest dollar is spreading here. Recently Vermont's Legislature, supported by Governor Aiken and Arthur Packard, state Farm Bureau

Federation leader, asked Congress to study managed currency as a means of restoring farm prices. Should not

we in New York state do the same?

Raising farm prices 67% by money management in 1933 increased the cost of living only 3%, but brought greatest increase in employment and pay-rolls this country had ever experienced.

Farmers have the political power. They must organize to demand of their parties and representatives in Congress a managed currency. Nothing else is so important. It would restore to their families 5 billions a year of lost farm income and also lift us out of depression. Unless farmers thus use their political power, we may not be able to save our constitutional democracy and system of free enterprise.

My call to farmers is to action. Unite, organize, demand restoration of a just price level by managed currency. Save agriculture to save America!

Birdsfoot Trefoil

Leland Cooke of Preston Hollow, Albany County, N. Y., first observed Birdsfoot Trefoil on his farm six years ago. To some extent it spread naturally, but Mr. Cooke top-dressed fields with manure to improve the stand, and last spring he seeded ten acres, with oats as a nurse crop, after adding 300 lbs. of superphosphate and a ton of lime to the acre.

Mr. Cooke says that for hay, Birdsfoot Trefoil should be cut in the early blossom stage, and that cows relish it and will maintain high milk production on it. He also has a lot of Birdsfoot Trefoil in the pasture which appears to be able to stand dry weather and, once established, seems to maintain a permanent stand.

CHOOSE CHEVROLET

for your new passenger car or truck
and get the greatest value
for your money!

For work or play—for passenger car or truck—it will pay you to choose Chevrolet!

The brilliantly beautiful Chevrolet passenger cars for 1939 are the most spirited performers in the entire field of economy cars. They out-accelerate, out-climb and OUT-SELL all other low-priced cars. They give you more for your money in every way . . . in modern styling . . . in modern comfort and safety features . . . in all-round quality and value!

And the same applies to the new 1939 Chevrolet trucks, offered in 45 models and

nine wheelbase lengths, including new Heavy Duty Cab-Over-Engine models. Extra-strong, extra-sturdy, extra-dependable, Chevrolet trucks are designed to haul bigger loads at lower cost throughout a longer, more carefree life. They're "the thrift-carriers for the nation" . . . all powered by Chevrolet's famous economical Valve-in-Head Engine . . . and all selling in the lowest price range!

See your nearest Chevrolet dealer . . . choose your new Chevrolet passenger car or truck . . . and you'll agree that to own a Chevrolet is to own the modern leader in low-cost transportation!

MILK Producers and Dealers Seek to Stabilize Market

AN ATTEMPT is again being made to bring about some semblance of stability in New York City milk market so that better returns can be made to producers. The first step was taken when a joint committee representing the Producers' Bargaining Agency and the Federation of Independent Milk Producers' Cooperatives

Central Sales Committee Endorses Program

The Central Milk Producers' Sales Committee, at a special meeting held in Hotel Syracuse, Syracuse, N. Y., on June 1, 1939, unanimously endorsed the uniform marketing agreement drafted by the Metropolitan Cooperative Milk Producers' Bargaining Agency and the Federation of Independent Milk Producers' Cooperatives in a meeting in the Onondaga Hotel on May 31.

The Central Sales Committee further resolves that it will aid all other groups in carrying out this program, even to the point of withholding milk on the farms if necessary.

This program is adopted for the purpose of stabilizing the milk industry pending the return of government regulation.

met together at Albany on May 24 and 25. The meeting was arranged by Commissioner Noyes.

Following a general discussion of ways and means, the meeting was adjourned to meet again in Syracuse on May 31 with dealers' representatives. In the meantime, members of the committees consulted with producers to get their viewpoints.

At the Syracuse meeting definite progress was made in arriving at an agreement on principles. Most important is the fact that a considerable number of dealers, who some time ago refused to sign a voluntary agreement to carry out the provisions of the marketing order, have had a change of heart and are now willing to support such a voluntary program. However, there are still about 150 milk plants in the milk shed that were not represented at the meeting. The milk from these plants is going to various small dealers who may or may not decide to cooperate in promoting an orderly market instead of present chaos.

After discussing the situation all day and half the night, representatives of both producers and dealers agreed on the important fundamental principles contained in the marketing agreement. Representatives of Sheffields, Bordens and other members of the Distributors' Bargaining Agency agreed to sign the voluntary contract providing a guaran-

"I bet that's the kid who fed him marbles for peanuts five years ago."

Quickest way to get Low Bacteria Count is to get this LOW-COST quick-acting chlorine killer!

Thanks to B-K Powder you can today lower your bacteria count and swiftly boost your milk profits by sanitizing the B-K way. B-K aids in producing quality milk by quickly reducing bacteria present on pails, strainers, milk cans, etc., at a cost of less than 1¢ a day for an average herd—if used according to directions.

B-K Offers Dairymen These Advantages: Keeps count down to a minimum... puts equipment in best condition for handling quality milk... is convenient to use in water of any temperature... sanitizes faster, more cheaply, and more thoroughly than dry heat, boiling water, or steam as ordinarily used... contains 50% active, available, bacteria-killing chlorine... has for many years been accepted by Public Health Authorities... contains 3 to 15 times more chlorine than many dairy bactericides on the market!

"A little B-K goes a good long way"

tee is made by *all dealers* to make the payments into the producers' settlement fund.

Representatives of a number of producers' cooperatives raised a logical objection at this point, stating that their organizations had lost heavily by diverting milk in the last attempt to put the voluntary plan into operation and didn't propose to be left holding the bag again. Their suggestion was that dealers signing such a voluntary agreement should pay weekly in *advance* sums due the producers' settlement fund. The proposal was readily agreed to by the larger dealers and some of the smaller ones. The task remaining is to convince all dealers that this paying in advance would result advantageously both to producers and dealers.

The encouraging part is that much of the milk produced by members of the Federation of Independent Milk Producers' Cooperatives was not diverted from non-cooperating dealers last March, but now producers' representatives claim that, if necessary, this milk will be withheld from dealers who refuse to sign and pay into the producers' settlement fund.

The next job is to get a large percentage of all dealers to sign this voluntary agreement. This task is being undertaken by a number of dealers, and only time will tell how successful they will be.

Regardless of the outcome of the conference, it made distinct progress. First it demonstrates that producers are still united. Second, it shows that a considerable group of dealers who fought the order are now convinced that they made a mistake. The situation that best pleases many of these dealers is to have the larger companies attempt to maintain a reasonable retail price which allows smaller dealers to cut under that price to their own profit and the dairyman's loss. Due in part to heavy supplies of milk, prices have been sliced to the point where everyone is a loser.

Court Decision on Filled Milk

On May 22 the Supreme Court upheld a decision of the lower court on dairy products. The Carolene Dairy Products Co. asked for an injunction against Secretary of Agriculture Wallace forbidding enforcement of the Federal Fluid Milk Act on one of their products.

The company sells compounds of skim milk and coconut oil under the name of Carolene and Milknut.

The request for an injunction was refused by the U. S. District Court in the District of Columbia, and the action was upheld by the Supreme Court on May 22.

Dairy Views on Federal Legislation

Recently nearly 100 dairy leaders from all parts of the country gathered in Washington to make known their views on pending farm legislation.

Representatives of Congress were informed that farmers are unalterably opposed to any plan to include agriculture in the Wages and Hour Law. Approval was given to an appropriation carried in the agricultural bill to be used in stabilizing market by removing dairy surplus commodities. Farm representatives also urged passage of the proposed amendments to the marketing agreement section of the Agricultural Adjustment Act intended to strengthen the law referring to milk marketing agreements.

EXTRA VALUE

WHERE IT COUNTS MOST!

See and drive the 1939 Ford cars, and you soon see where the high enthusiasm of this year's Ford owners comes from! Here are more important improvements — more worthwhile features — than in any other low-priced car. See them for yourself — and you'll agree — Ford V-8 has what it takes to be a great farm car!

1939 Ford owners get the **BIGGEST HYDRAULIC BRAKES** ever used on any low-priced car.

1939 De Luxe Ford owners enjoy the **MOST ADVANCED STYLING** in this year's low-price field.

1939 Ford owners get the smooth power of the **ONLY V-8 ENGINES** in any low-priced car.

1939 Ford owners get the only **RIDE-STABILIZING CHASSIS** among all low-priced cars, with full Torque-tube Drive, 4 radius rods, transverse springs. No front end bobbing or dipping. Best roadability on rough roads, least sidesway on turns.

1939 Ford owners get comfort of the **LONGEST RIDEBASE** in any low-priced car (123 inches between front and rear spring centers).

1939 Ford owners get! **HIGH OVERALL ECONOMY** that includes not only low gas and oil consumption, but low maintenance costs that have made Ford cars famous for years!

1939 Ford owners get **EXTRA EQUIPMENT** at no extra cost, included in low Ford V-8 delivered prices.

THIS IS THE YEAR TO GO

NORTHEASTERN Slants ON THE National NEWS

■ Congressional Wind-Up

WITH July 15 set as tentative date for adjournment, Congress is busy polishing off its legislative program for this session. Following is brief account of "unfinished business":

Farm Bill: Now in conference, to iron out differences in House and Senate versions of bill. Main bone of contention is large amount by which Senate increased sum approved in House bill. (Senate added 225 millions for farm parity payments and 113 millions for distribution of surplus commodities, bringing total farm appropriation up to \$1,218,666,572, largest in history.)

Aid for Railroads: Last week Senate passed Wheeler revision bill, which it is said will simplify rate-making procedure, ease consolidation requirements, and bring water, motor and rail carriers under similar Interstate Commerce regulation rules.

Wagner Labor Relations Act Amendments: It is doubtful that anything will be done at this session, as it is reported that hearings and studies of the bill will probably last throughout the summer.

Wage-and-Hour Amendments: Hearings on law have ended and amended bill sent to House, where it met strong farm opposition because amendments suggested elimination of wage-hour exemptions which original bill gave to "first process" agricultural workers. Another bill has been offered, omitting this proposal.

Social Security Act Amendments: (See article on this page).

Tax Revision Bill: (See special article, this page.)

Federal Housing: Under bill agreed to in conference and about to go to President, Federal Housing Authority's power to insure mortgages is to be extended to July 1, 1941, and amount of insurance it can issue is increased from 3 billion to 4 billion dollars.

■ Revamping Social Security Act

AMENDMENTS to Social Security Act, submitted to House May 24, call for changes which will aid both business and those who are eligible to receive benefits under the Act. If Congress approves amendments, business will pay 2½ billion dollars less in payroll taxes to government during next three years than it would if Act continued in its present form. Payroll taxes for old-age insurance would be held to present rate of 1 per cent for next 3 years (instead of being increased gradually as law now calls for); also, States would be allowed to reduce their unemployment insurance contributions after a certain reserve was built up and minimum benefit standards met.

Here is how workers and others who come under the act will be benefited if Congress approves amendments:

1. Date of starting old-age benefits would be moved up to next Jan. 1, instead of Jan. 1, 1942, date set originally by law.

2. Initial benefits would be bigger; also, bigger benefits would be provided for aged wives, widows, orphans and dependent parents.

3. Special board would be set up to safeguard social security receipts by government, to insure that such monies are used for social security purposes

and not spent for general government expenses.

Amendments also broaden and clarify the term "agricultural labor" so as to exclude approximately 300,000 persons who now come under the insurance provisions of the Act.

As we go to press, Townsend old-age pension bill has just been defeated in the House by overwhelming vote of 302 to 97. Those against it argued that it was impractical and too costly for nation to undertake. (Plan called for \$200-a-month pensions to those over 60 years, to be financed by a 2% sales tax. Experts who studied plan claimed it would result, even if it became law, in much smaller pensions, averaging around \$50 a month.)

■ Givers and Takers

RECENTLY published in New York Times was table showing Federal taxes paid by States in the five and a half years up to end of 1938; also, amounts received from Federal government by States for farm subsidies and relief, same period. Table shows that some States got far more from Washington than they paid to it in Federal taxes of all kinds. New York State, on other hand, was far on the "give" side, contributing more than 5 billions to Treasury in the five and a half years, and getting back in WPA and AAA grants only about 1 and ½ billions. Among States which benefited most from the exchange were Alabama, Arkansas, Montana, and Nebraska. A few States almost struck a balance in taxes paid and benefits received, among them being Vermont.

Here are the figures for the 5½ years for Northeast States:

State	Taxes Paid	Farm Subsidies	Relief Payments
Connecticut	\$339,402,188	\$3,668,913	\$95,327,000
Delaware	275,619,126	1,580,880	8,739,000
Maine	56,938,093	2,661,312	34,600,000
Massachusetts	779,134,428	2,482,649	409,825,000
New Hampshire	35,688,176	461,749	27,730,000
New Jersey	905,211,588	2,194,731	339,371,000
New York	5,007,551,014	9,477,423	1,383,748,000
Pennsylvania	1,915,251,030	11,731,619	969,111,000
Rhode Island	128,233,759	74,860	43,164,000
Vermont	16,736,952	1,299,423	14,374,000

■ Tax Revision Plans Jelling

LAST WEEK, definite step toward revising taxes to help business was taken when House Ways and Means Committee opened hearings on the subject. Committee's action followed conference between President Roosevelt, Treasury officials and leading members of Congressional finance committees, at which President finally agreed to repeal of hated undistributed profits tax, on condition that total tax revenue would not be cut.

First witness to testify before House Committee in behalf of business was Secretary of Treasury Morgenthau. The tax program which he submitted to the Committee recommends permitting corporations to carry forward losses from bad years to apply against profits in good years (in fairness to corporations whose earnings vary from year to year). Also urged by Secretary Morgenthau was repeal of undistributed profits tax and repeal of capital stock and excess profits tax. Mr. Morgenthau said further that he thought it would be only fair and logical to raise the question of whether present surtax rates on very large incomes may not be so high that they discourage investment and business expansion.

It is expected that after Committee concludes its hearings, it will submit a compromise tax program to Congress which will win early approval.

SLANT: If there is any improvement made in present tax law at this session of Congress, most of credit should go to Secretary Morgenthau and Senator Pat Harrison, Mississippi Democrat. Both of these men have been hammering away for months at problem of helping business by ridding it of unfair tax burdens, particularly the undistributed profits tax.

■ American People Against Crop Control

"DO YOU think our government should or should not control the prices of farm products by controlling production?" This question, asked in a survey conducted by Fortune magazine, brought forth 61.8% "Should not's". The remaining 38.2% was divided into 22.9% in favor of government crop control and 15.3% replying "don't know or it depends."

In addition to question on farm price control, survey asked whether government should provide for the needy, find work for the jobless, regulate utility rates, decide capital and labor disputes, redistribute wealth, supervise movies, and supervise the press. Answers, according to Fortune magazine, "reveal that the people are not in the mood to change the government radically from what it has been in the past... The people utterly rejected the idea of government ownership and operation of factories making essential commodities such as clothes and food, or of insurance companies, telephone or telegraph systems, and there is a clear majority against government ownership and operation of the railroads."

Fortune publishes following table of answers to question "Do you think that our government should own and operate all, some, or none of the following:

	All	Some	None	Don't Know or dep.
Postal services	86.9%	5.3%	3.8%	4.0%
Hospitals and medical service	14.4	59.2	18.8	7.6
Natural resources	21.3	33.5	32.9	12.3
Electric power	19.7	24.3	41.9	14.1
Railroads	21.7	12.0	52.6	13.7
Telephone and telegraph systems	15.0	14.5	57.7	12.8
Insurance co's	13.1	14.4	61.1	11.4
Manufacture of essentials	7.3	14.3	70.0	8.4

SLANT: Answers to part of question relating to government control of hospitals and medicine is particularly interesting right now when such strong pressure is coming from Washington for socialized medicine. Above table shows only 14.4% in favor of government control, with a total of 78% either against government control or in favor of only "some" government medical service.

■ Stamps for Food

FEDERAL food stamp plan, for distribution of surplus foods through retail stores to persons on relief, is now in operation in Rochester, N. Y., and is reported to be meeting with more success than was expected. In that city, all recipients of public aid (including beneficiaries of social security program as well as WPA workers and those getting direct relief) are being given 50 cents worth of blue stamps free with every \$1 worth of orange stamps which they buy. The blue stamps can be used only to buy foods which have been declared surplus by government. At present these are flour, grapefruit, oranges, dried prunes, cornmeal, butter, eggs and dried beans. Orange stamps can be used for purchase of any food on grocer's shelf.

Rochester grocers, bankers, newspapers, and business men generally are actively supporting the plan. Also,

Straw

By EDITH HORTON.

Some are made of marble,
Without any flaw,
Others are of crumbling clay—
I am made of straw.

A little wind can send me
Any way it goes;
I shall collapse entirely
When a tempest blows.

unanimous endorsement of manner in which U.S.D.A. is handling project was voted at recent annual meeting of National Food and Grocery Conference in New York City. In a wire to Secretary Wallace, the organization pledged whole-hearted support of plan by all branches of food industry. Grocers are said to be enthusiastic about it because it routes food surpluses for relievers through normal distributing channels, instead of through relief agencies.

During first five days that plan was in operation, Federal Surplus Commodities Corporation reported that more than half of the city's 15,000 families receiving some form of public assistance bought \$49,989 worth of the orange and blue stamps. Apparently all those who are eligible to take advantage of plan are not doing so because of regulation which requires that in order to get blue stamps free, a family has to buy weekly minimum of \$1.00 worth of orange stamps for each person in the family.

Other variations of stamp idea are to be tried in four other cities in other sections of the country during next few months. Plans are also under way for extension of program to other products, if it proves feasible in case of surplus foodstuffs.

■ Plan to Cut Railroad Rates

IF NEW rail rates proposed last week by Eastern Railroad Presidents' Conference are approved by Interstate Commerce Commission, it will pay travelers to take long trips. Conference, representing 27 railroads serving Northeast, decided to reduce round-trip coach and sleeper fares on zoning plan. One-way tickets will continue at present rate.

Under proposed scale, round-trip coach fares would be cut ¼c a mile for first 100 miles, with another reduction in rate per mile for each 50 miles traveled up to 901 miles. At that distance, rate would be down to 1.7c per mile (reduction of 32% over present 2½ cent per mile rate), and that would be the minimum mileage rate, no matter how much further the traveler went.

Round-trip tickets good in Pullman lower berths, parlor cars and in other accommodations, except upper berths, would also be cut on a sliding scale, with reduction amounting to 10 per cent over present rate at 901 miles.

Special rate is proposed for round-trip upper berth tickets, which would amount at maximum distance to a cut of 19% below present one-way fare. Pullman charges for berths or chairs would be in addition to these basic fare rates, and would be same as at present.

■ From Soy-Bean to Necktie

HENRY FORD has a new necktie. It's not an ordinary one, being partly made from soy-beans. For a year and a half, Ford company laboratories have been working to perfect a process of making a textile from protein of soy-bean, with idea of using

it industrially in manufacture of automobile upholstery. Already, in various experiments, this new soy-bean textile has been spun, woven, and manufactured into a number of articles. Fabric is said to look like mixture of silk and wool, and to have about 80 per cent of durability of wool.

Ford chemists' discovery of soy-bean as a potential source of cloth is said to have resulted from extensive use of soy-beans by Ford company in production of paint and plastics. Oil is extracted from the bean as a base for paint, and the plastic product is used for such auto parts as gear shift lever balls, light switches, and accelerator pedals.

Doctors Condemn Health Bill

AMERICAN Medical Association, at 90th annual convention recently, went on record as "unmistakably and emphatically" opposed to Wagner national health bill now before Senate, on grounds that it is contrary to best interests of American people and a threat to the national health and well-being.

Twenty-two reasons were given by the Association for condemning the measure, which was introduced into Congress to carry out President Roosevelt's national health program. Chief among doctors' objections to bill are:

1. It does not safeguard in any way continued existence of the family doctor.
2. It proposes to make Federal aid for medical care the rule rather than the exception.
3. It does not recognize the need for suitable food, sanitary housing, and improvement of other environmental conditions necessary to continuous prevention of disease.
4. It "insidiously promotes the development of a complete system of tax-supported governmental medical care."
5. It provides for supreme Federal control; Federal agents are given authority to disapprove plans proposed by individual States.
6. It offers no method for determining nature and extent of need for preventive and other medical services for which it proposes to allot funds.
7. It is inconsistent with fundamental principles of medical care established by scientific medical experience, and is therefore contrary to best interests of American people.

Pointed out by American Medical Association was medical profession's record of accomplishment in improvement of public health, prevention of disease and care of the sick. The Association urged that instead of saddling country with "supreme Federal control" of health and medicine, a plan be worked out for local determination of health needs and for local administration control. Such a plan, it pointed out, was consistent with philosophy of American form of government and would not damage the quality of our medical service.

Russia Holds Off

ALL EFFORTS of Britain and France so far to get Russia into the anti-Hitler block have failed. Just when it looked as if they were all set, Russian Foreign Minister Molotov made speech which dashed British and French hopes. In order to win Russia's aid, he said, they would have to guarantee against aggression "all European countries bordering on Russia without exception." These countries are Finland, Estonia, Latvia, as well as Poland and Rumania.

In spite of this set-back, Britain and France are continuing their negotiations with Russia and believe that she can still be won to their side.

Television is Here

AT DEDICATION of the Radio Corporation of America building at World's Fair, event was covered by television, and speech and likeness of David Sarnoff, R.C.A.'s president, were reproduced in New York, eight miles away.

National Broadcasting Company has now embarked on a regular schedule of television broadcasts, at present limited to vicinity of New York. On market are four types of television receivers, ranging in price from \$199.50 to \$600.

Good Books to Read

NEXT TO VALOUR, John Jennings. Jamie Ferguson, fleeing with his mother and sisters from the disasters which the Stuart cause brought upon its followers, came to the Province of New Hampshire in 1746. The young Scot became a skillful woodsman and scout and joined Rogers Rangers to take part in the French

and Indian War. The story is full of romantic adventure.—Macmillan Company, New York. \$2.75.

THE ALTAR-PIECE, Naomi Royde Smith. Coming from a dockside parish in one of London's poorest districts to a rich living in a quiet cathedral town, the Vicar of Estingford found nothing more pressing to trouble him than a matter of church architecture. But the arrival of a newcomer to the town, a widow of ample means and a passion for embroidery, was the beginning of trouble, and of a mystery that is not unravelled until the last page of the book and the completion of the altar-piece.—The Macmillan Company, New York. \$2.50.

Good Movies to See

THE HARDYS RIDE HIGH. Another of the Hardy family hit parade, as they become "millionaires for a day." Featuring Lewis Stone, Mickey Rooney, Cecilia Parker and Fay Holden.

UNION PACIFIC. Barbara Stanwyck and Joel McCrea star in this romance of America's empire builders, the men and women who worked, fought, suffered to make the American dream come true.

PUT UP HAY THIS EASIER WAY!

Stop slaving in the hot, dusty hay mow. In good weather, blow your hay into the mow or stack with this Papec. Save time-labor-space. Good weather or bad, make green hay crops into grass silage. A simple Papec attachment adds molasses or phosphoric acid automatically to preserve the crop. In addition, this Papec with its special feed roll handles corn better than any standard ensilage cutter. Chops straw. Shreds fodder.

Write for free booklet. Facts about grass silage, chopped hay, trench silos, storing straw. No obligation. Papec Machine Co., 396 S. Main St., Shortsville, N. Y.

"I have seen nothing that I would exchange for my FARMALL" W. B. WILLIS
New Market, Md.

Here is W. B. Willis, New Market, Md., at the wheel of his "Old Reliable" Farmall—Serial No. T-13714.

"WHEN I bought my FARMALL in 1927," says Mr. Willis, "the dealer told me it was really built to take it. After the fall plowing and the land that I cleared on my 232-acre farm, I certainly agree with him. The toughest job I put it to was clearing 35 acres of timber and hauling it to the sawmill. I have hauled logs to the sawmill through 18 inches of mud, and truly at times I wondered how it stood the gaff that I put it to.

"I have demonstrated 'Old Reliable' against some of the present-day competitive tractors and as yet have seen nothing that I would exchange it for. If and when I get a new one there is only one tractor in my mind, the FARMALL."

Thousands of owners have written to tell us about their Farmalls. Ask the International Harvester dealer in your neighborhood to show you why owners are proud to boast, "I Own a Farmall." He will demonstrate any of the three Farmall sizes to you on your own farm—equipped for your soils and crops—any time you say the word. And remember, his store is headquarters for the full line of International Harvester tractors—three Farmalls; six standard wheel-type tractors (one powered by Diesel); and six TracTractors (three powered by Diesel).

For the peak in farm power value, choose an International Harvester Tractor!

Only FARMALL Brings You All of These Valuable Features:

- 1—Patented automatic steering-wheel cultivator gang shift. Clean cross cultivation at four miles an hour.
- 2—Most complete line of direct-attachable machines to choose from.
- 3—Unmatched ability for all row-crop work.
- 4—Outstanding economy on distillate or other tractor fuel.
- 5—Smooth 4-cylinder power—valve-in-head efficiency.
- 6—Replaceable cylinders.
- 7—Steering operates wheel brakes automatically when making pivot turns.
- 8—Unequaled record for long life.
- 9—High resale value.
- 10—Complete nation-wide service.

IMPORTANT BILLS

Now Before Governor Lehman

A NUMBER of bills passed by the last session of the New York State legislature are of interest to farmers. The majority of these bills have not yet been signed or vetoed by

Supreme Court Sustains New York and Boston Milk Order

BY A FIVE to four decision the United States Supreme Court upheld the constitutionality of the New York Milk Marketing Agreement and Order and reversed Judge Cooper's recent decision. The decision was read by Justice Reed.

The Court remanded the case to the Northern New York Federal District Court, with definite instructions to issue orders to the four dealers involved in the case, instructing them to comply with the terms of the Order.

By a six to three decision the Court upheld a Massachusetts Court decision affirming the constitutionality of the Boston Order. This, it is expected, will result in turning back to dairymen between two and three million dollars that has been held by the Court.

the Governor. Where bills have been signed, making them law, the fact will be so indicated.

FARM TRUCKS AND TRAILERS.—Bill provides for nominal registration fee of \$1 a year for trucks and trailers used strictly in the farm business. While the Motor Vehicle Bureau has ruled that tractors and trailers can be used in the roads between fields of a farm or between two farms owned by the same man, the situation has not applied to trucks. This will clear up an annoying situation, and it is hoped that the Governor will sign the bill.

UNEMPLOYMENT INSURANCE.—An amendment to the Unemployment Insurance Law clarifies the term "farm labor" and defines exemptions more definitely. This bill is an improvement needed by farmers and should be signed.

CHEESE.—A bill amending the cheese law would provide that cheese may be stenciled with the terms "New York State Whole Milk Cheese" or "New York State Whole Milk Washed Curd Cheese," providing it meets the highest grade requirements established by the Commissioner of Agriculture. Previously all cheese could be so marked. The bill proposes to make the label a mark of quality which can be recognized by consumers.

STATE LABEL.—A law is now on the books permitting the use of the state label for farm produce properly graded. This law is again an attempt to guide the consumers and guarantee that produce bearing the label is of high quality. The new bill provides an appropriation of \$50,000 to finance the state label plan. The appropriation is self-liquidating—that is, labels will be sold and funds therefrom turned into the state treasury. The bill has not yet been signed.

ITINERANT TRUCKERS.—A bill which will become law if signed requires merchant truckmen, including those who operate motor trucks and buy farm produce for resale, to register with the Department of Agriculture, and pay a fee of \$5. Where a truckman owns more than one truck, \$1 extra would be required for each additional truck. The intent of this bill is to make it easier to identify itinerant

truckmen and thus avoid some of the difficulties experienced by farmers in getting pay for produce sold.

MILK PUBLICITY.—This bill carries appropriation of \$310,000 for milk advertising. This also is a self-liquidating appropriation and would be repaid by a tax of $\frac{3}{4}$ ¢ on each 100 lbs. of milk—half to be paid by the dealer and half by the producer. This is merely a continuance of efforts of this state to increase consumption by publicizing milk.

SUPPLEMENTARY BUDGET.—The regular budget was cut \$31,000,000 by the legislature, but some of these cuts were partially restored in a supplementary budget. For example, the original budget cut the appropriation for the State College of Agriculture \$157,000. The supplementary budget restores approximately \$38,000. Appropriation for the Geneva Experiment Station was cut \$34,000 and the supplementary budget restores about \$4,000. Also restored is \$1,500,000 of state aid for town and county roads.

Other bills provide for a reduction in state aid for county roads from \$30 a mile to \$15 a mile and also a reduction in state aid for town roads. The present basis for aid to town roads is \$75 a mile less the amount raised by $2\frac{3}{4}$ mills tax on adjoining property. The new bill not yet signed reduces the base amount of \$62.50 a mile.

Another bill if signed will make it

mandatory for town and county highway superintendents to remove weeds and brush along town and county roads some time between July 15 and August 15.

SCHOOLS.—A bill was passed to suspend the establishment of central rural schools beginning June 1 for a period of one year. It has been predicted that the Governor will not sign this bill.

Another bill provides that out-of-state pupils in elementary schools and academic departments shall be considered as a part of the school registration for purpose of determining state aid.

TAXES.—The tax on liquor was increased from \$1.00 a gallon to \$1.50 a gallon. This bill has been signed and is now a law.

Bills also signed provide for continuation of the emergency taxes on gasoline, business franchises, personal incomes, stock transfers, utility income, and estates of non-residents.

RELIEF.—A bill believed to have general support in rural sections would make local authorities responsible for the administration of home relief, but with state aid continued as before.

STRIKES.—Another proposed bill would make it a misdemeanor to interfere with a person driving a motor truck while it is loading or delivering goods. This, of course, is designed to prevent interference with truck transportation during strikes. It has been predicted that the Governor will not sign this bill.

MARK OF ORIGIN.—The Governor has vetoed a bill which would have

American Agriculturist, June 10, 1939

required all merchandise imported into the state to be marked plainly with the place of origin. Reason given was possible effect on federal trade agreement policies, including retaliatory legislation against American products.

Dairymen's League Annual Meeting

THE Home Department of the Dairymen's League will hold its annual meeting at Utica on June 14. Speakers will include Mrs. Charles Sewell, representing the Associated Women of the American Farm Bureau Federation, and Paul Taber of the G. L. F.

The following day, June 15, is the date for the annual meeting of the Dairymen's League at Utica. The session will open at 10:00 A. M. at the Stanley Theatre on Genesee St. In the forenoon President Fred Sexauer will give his annual address. This will be followed by reports of the Treasurer and the Membership Auditing Committee.

Speakers in the afternoon will be H. V. Noyes, Commissioner of Agriculture and Markets, and John H. Light, Secretary of Agriculture in the State of Pennsylvania.

The Resolutions Committee will meet Monday, June 12, and will have their report in printed form ready for distribution to the delegates on Thursday.

WGY Farm PROGRAMS

Monday, June 12th

European Tour Cancelled

DUE to unsettled conditions in Europe, our European Tour has been definitely cancelled. All deposits made on reservations will be returned promptly.

We hesitated to take this action and regret the necessity of disappointing those who have made reservations, but careful consideration convinced us that it was the correct step to take.

Grange Bread Baking Contest News

A Grange Brother Takes Part

FIRST Grange to report a man among contestants in its bread baking contest was Cayuga Lake Grange of Cayuga County. Mrs. S. Hurrell, chairman of this Grange's service and hospitality committee, writes:

"A great deal of interest and fun was derived from our bread contest. Six ladies and one man entered!" (We hope the fact that first prize in the contest was won by a Grange sister, Mrs. Harry White, won't discourage Grange brothers in other Granges from trying their luck.)

We wish we had space to print all of the enthusiastic and interesting reports of contests that are coming in daily from chairmen of S. & H. committees. Here are excerpts from just a few of them:

"We had a very pleasant evening, as the men suggested that we auction off the bread and that made a lot of fun."—Mrs. Henry E. Willsie, Chairman, Echo Grange, Greene Co.

"I think we ought to have more bread baking contests, so that ladies would get into the habit of making homemade bread. Those who took part in our con-

test enjoyed it very much. After the bread was judged, we had it with jam and jelly for refreshments, and it made a delicious lunch."—Mrs. Albert Meyer, Chairman, Boston Grange, Erie Co.

"Our contest was very successful, with seven fine entries. The winner, Mrs. Pauline Witfield (see picture), is a very efficient homemaker. She and her husband and one small son live on a dairy farm in Little Britain. She was Ceres in our Grange last year and is such a good help to our Grange."—Mrs. R. S. Finley, Chairman, Little Britain Grange, Orange County.

"We had a grand evening the night we put on the bread contest. Our winner, Mrs. W. H. Chardavoyne, is 78 years old and we are very proud that she can still bake well enough to win first place. Also, she still bakes pies and cakes for all the affairs in our little town."

—Mrs. R. S. Wood, Chairman, Bloomingburg Grange, Sullivan Co.

Since our last issue, the following Subordinate Granges have reported names of first prize winners:

COUNTY	GRANGE	WINNER
Allegany	Whitesville	Mary Ainsworth } Belle Heseltin } tie
Cattaraugus	Gowanda	Mrs. Foster Lewis
	West Valley	Mrs. Leo Kruse

	Rushville	Mrs. Earl Laffer

Mrs. Pauline Witfield, winner of bread baking contest held by Little Britain Grange, Orange County.

Ways of Increasing Farmers' Returns for Milk

PART I.

By LELAND SPENCER

WHEN the submarine Squalus recently sank to the bottom of the sea off the New England coast, the Navy Department promptly rescued the survivors and then went to work on a definite plan and procedure for raising the craft to the surface. No one doubts that these efforts will succeed and that the Squalus will soon be floated and restored to service.

Leland Spencer

Apparently the task of raising the incomes of New York dairy farmers, after they have suffered a severe sinking spell, is a more complicated problem and one for which science has not yet produced a definite and certain remedy. The average price received for Grade B milk delivered in April by those dairymen who produce for the New York market was \$1.14 per hundredweight, or 20 per cent below the pre-war average for that month. On the other hand, the prices of things that farmers buy averaged about 20 per cent above the pre-war level. Experience shows it is practically impossible to bring down the costs of living and production without long delay. Consequently the efforts to relieve the financial distress of farmers are directed toward raising their incomes. In order to put New York dairymen in as good a position as they were in the five years preceding the World War, the gross returns for milk should be raised about 50 per cent, or more than that in case the farmers' expenses should rise.

Many different suggestions or demands have been made as to steps that should be taken by the Government or by the industry itself to raise the incomes of dairymen to a higher level. Opinions differ so widely on the value or justice of the different proposals that progress toward correcting the situation seems discouragingly slow. It will pay us to study these proposals and to determine, if we can, what measures or combination of measures would give the best results.

The numerous ideas for increasing the incomes of dairymen, that have come to my attention recently can be grouped under five headings, as follows:

1. Have the price of fluid milk fixed and enforced by public authorities—Put the Federal and State orders for the New York market into operation again.
2. Restrict the supply of dairy products and competing products, such as oleomargarine, in various ways.
3. Reduce the spread between the farmers' price and the consumers' price for milk.
4. Increase the consumption of milk and other dairy products.
5. Raise the general level of commodity prices.

In an early issue we shall consider the possibilities of price fixing by public authorities.

Cheese Consumption Increases

Striking development in dairy industry is continued uptrend in consumption of cheese, which has increased fully 25 per cent since the beginning of the depression. Biggest gainer and most important type, is American or Cheddar cheese, consumption of which is 33 per cent greater than in 1930.

Increase in use of cream cheese is even greater on a percentage basis, the

volume having trebled within the past eight years. Total output, however, is much smaller than American type.

American made Swiss cheese is also increasing, while imports are decreasing. Other varieties, including Limburger, Italian types, remain about stationary in consumption.

This upward trend in cheese consumption per capita is in marked contrast to the trends in consumption of many staple food products. Per capita consumption of butter in the past 5 years was about the same as in the pre-war period 1910-14, but considerably less than in the 5-year period 1900-04. In the last 40 years the trend in per capita consumption of meats (beef, veal, lamb, mutton, and pork) has been distinctly downward. There has also been a downward trend in per capita production of potatoes.

Sheffield April Prices

Prices received by Sheffield producers for April milk were not available when the last issue went to press.

The Sheffield price for 3.5 milk in the 201-210 mile zone, subject to the usual differentials, was \$1.135.

More Butter for Relief

The U. S. Department of Agriculture announces that the Federal Surplus Commodities Corp. has been authorized to buy an additional 25,000,000 lbs. of butter during the fiscal year ending June 30. This raises authorized purchases from 90,000,000 lbs. to 115,000,000 lbs.

The butter will be given to state welfare agencies for distribution to families on relief.

Total holdings of butter about May 20 were estimated at 72,768,000 lbs., which is 34,968,000 lbs. more than last year. Of the total amount, about 16,200,000 lbs. were estimated as being privately owned, the balance by government agencies.

Wheat

It is too early accurately to predict the yield of spring wheat, but present indications are for a yield no higher than the average for the past ten years. Based on this, and with winter wheat crop indicated on May 1 at 544,000,000 bushels, total wheat crop this year is estimated at about 700,000,000 bushels. This, together with prospective carry-over of about 275,000,000 bushels (including insurance wheat), would give a total domestic wheat supply for 1939-40 of slightly less than a billion bushels, compared with \$1,084,000,000 bushels the previous season.

The Commodity Credit Corporation have announced a wheat loan program for 1939 similar to that of a year ago. With a larger percentage of wheat farmers eligible for loans this year, it is expected that the program may give more support to wheat prices than it did last year.

Egg Market News

The estimate of eggs in storage on May 20 was 5,192,000 cases. Last year the figure was 4,556,000 cases, showing an excess this year of 636,000 cases. Eggs are going into storage at a more rapid rate than they did a year ago.

Estimates for frozen eggs in storage on the same date were 109,201,000 lbs., compared to 124,079,000 lbs. a year ago.

The U. S. Department of Agriculture, through the A.A.A., has been buying some eggs for relief on the Mercantile Exchange, bidding 16¼c for carlots of fresh gathered firsts. This is interpreted as an attempt to prevent egg prices from going lower, although

there appears to be no disposition to force prices higher.

Recent hot weather has caused some complaint about quality of eggs received in New York, and as a result, premiums have been paid for strictly fancy eggs.

For the week ending May 26, New York State Department of Agriculture reports egg-feed ratio as 9.5. A year ago it took 7.3 doz. eggs to buy 100 lbs. of feed and two years ago 11.9. The Department reports wholesale egg prices as approximately 5c a dozen lower than a year ago, with poultry feed costing just about the same as it did last year.

April was the seventh consecutive month in which baby chick hatchings were larger than the corresponding month last year. Eighteen per cent more salable chicks were hatched by commercial hatcheries during April than a year ago. For the four months of January through April hatchings exceeded last year by 23 per cent.

Frozen Vegetables

On May 1 there were 47,400,000 lbs. of frozen vegetables in storage, which is over twice as large as stock a year ago and seven times as large as stock two years ago. Since December 1, consumption of frozen vegetables has been about twice as heavy as a year ago.

It is expected, however, that only about as many vegetables will be frozen this season as a year ago, partially because of heavy stocks now in storage and partially because of small acreage of vegetables for manufacture.

Annual Field Day of Empire State Potato Club

The 10th Annual Field Day of the Empire State Potato Club will be held on Thursday, August 3, at Gardner Farms, Tully, N. Y. Gardner Brothers are among the oldest and best known growers of certified seed potatoes in the United States. Their average annual acreage is about 80.

Don Ward, Manager of the Onondaga County Farm Bureau, is general chairman of the arrangements and already he has appointed the several committees to plan and carry out the program.

Last year an estimated 12,000 farmers attended this event at Orchard Park. This year the machinery exhibits will be the most extensive ever staged in New York State.

from Skeff's Notebook

Seek Lower Storage Costs

A current subject of discussion among fruit growers is cold storage rates. There has been practically no change in the rate structure in Western New York in many years. Many of the storage plants were built with growers' money, with the idea that they were essential to fruit and vegetable growing areas. There is no doubt that some of the storages were built too expensively, or that the investment was too large for the business. For a number of years fruit growers have been receiving low prices for their fruit and the 20-cents per bushel storage charge on apples has been one of the major items of cost.

Few apple growers admit to having broken even last year. The very low price range bears this out. Because of poor prices many growers held as many apples as possible in any available farm storage. At the end of the season the storage charge appeared to be the last straw. Some storages recognized this and gave rebates to growers. William Wilbur, Williamson fruit grower, has been discussing the subject with a number of growers. He told me sentiment now is strongly with storages that have offered new and revised schedules this season. Especially attractive is the "refill" rate.

Apple harvest this year will run two or three weeks earlier than usual. There is danger of an avalanche of fruit being dumped on the market to hurt prices, unless they are put into storage. Crop reports indicate a less-than-normal crop of apples this year in all sections except the Pacific Northwest. Therefore, this should be a good season for judicious use of storage facilities. Some storages have offered a "refill" rate by which early apples may be stored and later replaced by late varieties. Several of the storages are reported offering lower rates than in past years and others, concerned with dividends and costs, are quoting former rates. "Box manufacturers and other concerns supplying apple growers have recognized our situation and cut corners; now there is strong sentiment for revision of storage rates," says Wilbur.

Two of the largest western New York growers are considering building their own cold storages. There are a number of such plants in the Hudson Valley and two years ago George Bradley built one at Barker, Niagara County. Growers who have looked into the matter say these operations have been economical and successful. There appears little doubt that this will be the next major trend among upstate fruit growers.

Low Fluid Milk Prices

do not compare favorably with returns from Selling Cream and Diversified Farming.

That is why so many farmers are changing to cream.

Cash received for the butterfat in cream amounts to almost as much as some get for the whole milk. Additional returns from feeding the skim milk are better than the average price of farm products.

Sell Cream and feed skim to calves, pigs and chickens for best results.

We offer you our Cash Market for all your cream. Payment made promptly for each shipment at top market price.

The FAIRMONT CREAMERY CO.
BUFFALO, N. Y.

Grinding Home Grown Grain

The use of feed grinders mounted on trucks which go from farm to farm is an interesting development in the use of home-grown grains. The outfit pictured here is owned by Henry Hoover, Ephrata, Pa. It combines mill and mixer in one unit. Hot water from the cooling system keeps molasses at the right temperature for mixing. This outfit can handle from 15 to 20 grinding jobs a day, and grinds and mixes dairy and poultry feed to the exact specifications of each customer.

Weyerhaeuser Announces \$2000.00 Genuine White Pine Lumber Contest

In order to better acquaint the farmers in the eastern states with the advantages of using Genuine White Pine Lumber, the Weyerhaeuser Sales Company of Saint Paul, Minnesota, has prepared an interesting campaign on Genuine White Pine, extending over a period of the next eight months; the first four months of which will be devoted to a series of four monthly contests.

Each monthly contest features seven prizes:

- FIRST PRIZE . . . \$250.00
- SECOND PRIZE . . . \$100.00
- THIRD PRIZE . . . \$ 50.00
- FOURTH, FIFTH, SIXTH AND SEVENTH PRIZE \$ 25.00 EACH

These prizes are to be awarded in the form of credit with the local 4-SQUARE Lumber Dealer, to be ordered out in Weyerhaeuser 4-SQUARE Genuine White Pine.

Contestants buy nothing, and are furnished an eight page booklet telling a brief but informative story about Genuine White Pine, The Wood of Our Pioneer Ancestors, The Easy Wood to Work With.

Contestants merely read this booklet, which is listed as reading time: 5 minutes, and then complete the sentence "What I Like Best About Genuine White Pine Is" on the official entry blank, which is the back cover of booklet.

The contest should prove interesting, not only to farmers but to town people as well.

The judges are the editors of the farm papers which will carry the monthly announcements about the campaign and are as follows: E. R. Eastman, President and Editor, *American Agriculturist*, Ithaca, N. Y.; Walter H. Lloyd, Editor, *Ohio Farmer*, Cleveland, Ohio; E. S. Bayard, Editor, *Pennsylvania Farmer*, Pittsburgh, Pa.

The first advertisement announcing the contest appears in this issue.

Silos for Grass Silage

Mr. Frank Hanlin of the Pape Machine Co., Shortsville, N. Y., believes that any silo satisfactory for corn silage will be equally satisfactory for grass silage. There has been some recent publicity indicating that the pressure of grass silage is considerably heavier, and therefore that silos used for it need to be reinforced with additional hoops. In this connection, Mr. Hanlin points out that hundreds of farmers have successfully stored grass silage in temporary silos held together with No. 9 wire. He adds: "Most farmers can safely use their present silos for grass silage."

An interesting booklet containing con-

siderable information is entitled "Grass Silage for More Profitable Livestock Farming—How to Make It and How to Feed It." This booklet can be obtained without any cost from many silo, molasses, acid and ensilage cutter companies; or will be sent promptly if you will send 10c to the National Association of Silo Manufacturers, Box 30, Norwich, N. Y.

Firestone Prize for Young Singers

The National Federation of Music Clubs, now holding its thirteenth Biennial Contest for young artists in Baltimore, Maryland, has just announced a \$500 cash award to be given by The Firestone Tire & Rubber Company to the winning singer of the Contest Finals. In addition to the cash sum, posted as the "Voice of Firestone Award", the winner will be featured in a guest appearance with the Firestone symphony orchestra under the direction of Alfred Wallenstein on the regular Monday Evening Voice of Firestone Program over the NBC Red Network.

Railroads Show Deficit

Class I railroads of the United States in the first three months of 1939 had a net deficit of \$43,591,000 after fixed charges, the Association of American Railroads announced recently. For the first three months of 1938, Class I roads had a net deficit of \$105,737,000 after fixed charges.

Kasco Mills have attacked the problem of what to do with empty feed bags. They are putting Kasco feeds in durable cotton print with fast colors, providing a piece of material which can be used in many ways to dress up the family or home.

The B. F. Goodrich Co., Akron, Ohio, find that six out of ten of their factory employees have been with the company ten years or more, and that one out of eight have been with Goodrich twenty years or more. This is especially interesting in view of the wide-spread interest concerning the difficulty of getting employment by a worker over 40.

In recent years careful experiments have shown serious results in certain crops growing on land deficient in certain minor elements. One of these elements is Boron. The Pacific Coast Borax Co., 51 Madison Ave., New York City, have a booklet "Boron in Agriculture." This is well illustrated and describes in detail the trouble which may come to various crops when Boron is lacking.

NEARBY MARKETS for NEARBY POULTRYMEN

Hatching for the High Market

By J. C. HUTTAR

BOTH Lee Weaver and I have on several occasions in the past gone into the matter of early or late spring hatching. Maybe Lee has, but I know I have never said anything about summer and fall hatching. I'm thinking about it, of course, from the marketing angle.

J. C. Huttar

Getting around as I do I would say that fall hatching has just about reached that point in the poultry business where it might bust forth in earnest almost any year. Most of the folks who have tried it get real enthusiastic over it. That's bound to spark a lot of others. The chicken business being what it is, however, I don't expect it ever to be too common. After all, most folks who keep hens also keep a few cows, grow some cash crops, and maybe fruit or grain or winter lambs. It still takes most of them pretty close to Thanksgiving before the results of their summer's work is all cleaned up. Such folks would have a hard time working in either summer or fall chicks.

But more and more people are starting a brooder house or two of September or October chicks. Why?

Those that I've talked with generally give about three reasons—

1. It balances income in a more timely way with expenses in the poultry business.
2. It makes more complete use of houses and equipment.
3. It gives them more of the high priced eggs, (they say).

There isn't any argument about the first two and for just a moment I won't argue about the third one either. (But I reserve the right to do so later.)

But, if it's more high priced eggs poultrymen are after, why didn't someone think of this fifteen or twenty years ago when the spread between the season's high and low prices was greater than it is now? I was looking it up and I found that fifteen years ago prices in the high month were almost two and one-half times what they were in the low. But in the past two years prices in the high month were only one and three-quarters times the low. So, you see, there really isn't as much advantage in high priced eggs as there used to be.

Well, as a matter of fact, there were plenty of people who thought of out of season hatching at that time. A number of colleges ran experiments hatching chicks practically every month in the year. A few brave poultrymen tried it too. The results were discouraging. Hatchability was very low, mortality in rearing ran high, but that wasn't the worst. They didn't get the high priced eggs. The fall hatched pullets which survived would start to lay in the spring and quit in the early fall almost at the same time as the spring hatched ones which had been laying much longer.

The trouble was that we didn't understand feeding for hatchability and confinement rearing like we do today. Nor was artificial illumination in common use to stimulate fall production. Neither did we understand the combination of avoiding extremes of temperature and yet getting good venti-

lation in the poultry houses in the winter like we do today.

But now we can get good hatches any month in the year, rear the birds about as successfully in confinement as on range and can stimulate production in the off-season almost as well as in the flush.

More High Priced Eggs

Now I'm going to question this argument that you get more high priced eggs from fall and winter hatched pullets than from those hatched in the spring and summer. I think it's just a matter of whether you get them at the beginning or end of their laying year.

I've got the records of a Pennsylvania poultryman who tried it out to back me up. I will admit, however, that even though this man had large hatches in each season and is a good poultryman, yet one swallow does not make a summer. Neither do one man's results absolutely prove a point.

This poultryman maintains three breeds, Leghorns, New Hampshire Reds, and Barred Plymouth Rocks. He made four hatches each of the Leghorns and New Hampshires and two of the Rocks. Here are his records on production for the pullets from each hatch:

LEGHORNS					
When Hatched	July	Nov.	Jan.	May	
Started Laying	Dec.	Apr.	July	Oct.	
Year's Production	203	196	192	204	
Eggs Laid in Sept.					
Oct. & Nov.	52	50	51	50	
NEW HAMPSHIRE					
When Hatched	July	Oct.	Mar.	May	
Started Laying	Dec.	Apr.	Aug.	Oct.	
Year's Production	208	195	191	194	
Eggs Laid in Sept.					
Oct. & Nov.	43	48	52	43	
BARRED PLYMOUTH ROCKS					
When Hatched	Nov.	Feb.			
Started Laying	May	Aug.			
Year's Production	176	189			
Eggs Laid in Sept.					
Oct. & Nov.	41	50			

Except for the advantage shown by February and March hatched pullets over other seasons' hatches in numbers of high priced eggs, there doesn't seem to be much else to indicate one season over another. And even this advantage might be argued on two counts.

1. It only showed up in Rocks and New Hampshires and not in Leghorns.
2. These birds started laying in August and so it's reasonable to assume that a smaller proportion of their fall eggs were large in size. Only the large eggs command the high prices.

Worth Watching

So for the time being at least I'm going to keep an open mind on this matter of hatching at all times of the year. For a straight commercial egg producer I can see some definite advantage in spreading out the hatching to get better distribution of income and better use of housing, labor, and equipment. On the other hand, cost of hatching eggs and cost of rearing would be heavier on the fall hatch.

"With all this war talk, now they want us to lay 'em with bombproof shells!"

This Summer—Visit NATURE'S WORLD'S FAIR—Yellowstone Park

Travel in Comfort and Safety by TRAIN

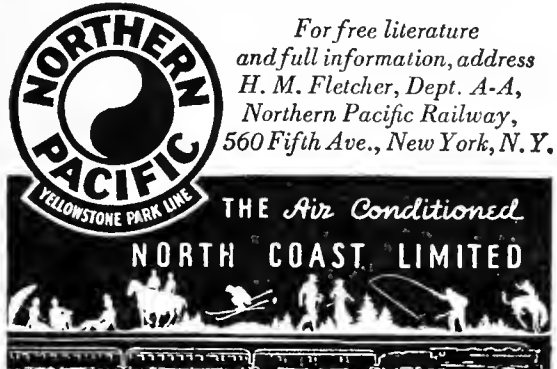

Include Yellowstone in your trip to SAN FRANCISCO EXPOSITION this Summer.

Go in one Gateway—out another—NORTHERN PACIFIC serves all principal entrances

NATURE has assembled wonders of the world in Yellowstone Park. Strange sights (boiling pools, steaming geysers, churning Paint Pots) ... scenes of breath-taking beauty (the glowing, rainbow-hued Grand Canyon of the Yellowstone against a backdrop of mountains and forests) ... flowers ... friendly bears and other wild animals! Where else in the world could you fill a vacation with so much to see and remember?

Experience two of Yellowstone's unforgettable Gateways instead of one! On the Northern Pacific Railway you can go in one gateway, out another! Choose the new, spectacular Red Lodge "Sky Ride" over the Beartooth Rockies ... Gardiner Gateway via Paradise Valley and Yankee Jim Canyon ... or the famous Cody Road with its 80 miles of thrills. The Northern Pacific serves all three! Enjoy the cool, clean comfort of an air-conditioned through Pullman on the Northern Pacific to Yellowstone ... for the vacation of a lifetime!

For free literature and full information, address H. M. Fletcher, Dept. A-A, Northern Pacific Railway, 560 Fifth Ave., New York, N. Y.

More Questions Answered

By L. E. WEAVER

Easy Culling

Isn't there some simple, easy way of culling the hens? I don't like to scare them by herding them through a catching crate, or by trying to catch them with a hook.

As soon as it is dark and the hens are well settled for the night, take some crates into the pen. In the darkness feel of the crop of each hen. Those with empty or nearly empty crops you should lift gently from the roost and place in the crate. Hens that are laying well have good appetites and full crops. Do not disturb them. Next morning examine the crated birds by daylight one by one, and release the ones that are laying. The others are culls. If you can't be sure by handling her whether or not a hen is laying, ask your County Agent or any experienced poultryman to show you the indications. This plan is a make-shift. You should give the entire flock a careful going-over at least once before fall. Hens soon become accustomed to being handled. It doesn't upset them to any extent.

L. E. Weaver

To Kill Lice

Will carbolineum on the roosts in the laying house keep body lice off the hens?

No. Carbolineum will keep red mites out. To get the body lice you must gas them. Nicotine fumes are fatal to the lice, and do not harm the hens. Paint Black Leaf 40 lightly along the top of each roost a half hour before the hens go to roost. Repeat ten days later. This is important. It gets the brood that is not hatched now.

Early Molters

If a hen stops laying and molts in June or July, won't she get through the molt and be ready to start laying again in August or September, just when eggs are getting to be worth something? Would it not be foolish to send her to market now?

That sounds like a good plan, but it isn't. It is based on a false assumption. You are assuming that the hen is a good producer and able to come back in a hurry and lay well for a long time after she comes back. Nine times out of ten, the fact that she quits so early marks her as a low producer by inheritance. She can't possibly lay more than a few eggs after she recovers her plumage. Then she will quit again. This was all tested and proven on hundreds of laying hens at Cornell years ago. Your chances are much better if you replace such individuals with good pullets.

Growing Ration

When should chicks be changed from a starting to a growing ration?

It is always best to follow the instructions of the concern which makes the feed. As chicks grow older they require less protein. Sometimes this change is accomplished by shifting to a "growing" mash with less protein—usually at around 6 to 8 weeks. Others may follow the plan used at Cornell.

The same mash is fed all the way through to maturity. The protein content of the "ration" is lowered by starting to feed grain at 6 to 8 weeks and gradually increasing the amount as the chicks grow older.

Skim Milk

Is skim milk a good feed for growing chicks?

Yes, one of the best. Give them all they will drink, but have water also for them. The milk may be either sweet or sour. The important thing is to feed it in clean containers. Chicks do not need dried milk in their growing mash when they have all the liquid skim milk they can drink.

Confinement

Is it better to let the hens run outside, or to keep them shut up all summer?

If your poultry house is kept free of red mites (an easy matter) and can be kept cooler than the outside in hot weather (another easy matter), it is best to keep the hens confined; better for the sake of your garden and flower beds, better from the sanitary angle if you are rearing young stock, and better because you will get more eggs with lighter colored yolks. They are worth more if you are shipping to New York City.

Cool Houses

How can I keep the hen house cool in hot weather?

Probably it cannot be kept cool, but it won't be so hot as outside if you have windows open, both front and rear or at opposite ends of the pen, and fairly close to the floor. Have a concrete floor with very little litter. Then it will cool down at night and the hens will enjoy smuggling down to its refreshing coolness in the heat of the day. Of course, the best possible plan is to have four or five inches of shavings or other good insulation on the sides and ceiling of the pen.

Selling Broilers

Is it best to sell the broilers just as soon as the market will take them—say at one and a half pounds, or will it pay better to keep them until they weigh three pounds or more?

Special markets and different breeds require different treatments of this question. However, a good general rule is that when the price trend is downward, to sell as early as possible; and when the trend is upward, it pays to grow them heavier if you have the room to hold them without crowding the pullets. Usually the trend is up until about the middle of May and after the 4th of July and downward between those dates.

Turkey Prospects

What are the chances of making any money this year with turkeys?

You can expect a reasonable profit this year if you can keep mortality to 10 or 12%, and feed an economical and efficient ration. Remember that a cheap ration is not of necessity either efficient or economical. A good green range will help keep down feed costs. Sanitary (clean) practices will keep mortality down.

A Federal report indicates that 27% more turkeys will be raised this year than last. However, demand has been increasing and has taken up the increased production, will probably do so again.

Fight COCCIDIOSIS POULTRY ENEMY NO. 1

When chicks show signs of coccidiosis—droopy wings, huddling and shivering, loss of appetite, bloody or watery droppings—ACT QUICKLY!

Don't even wait for a diagnosis. Treat your flock at once with Dr. Salsbury's Rakos—the scientifically blended liquid flock treatment.

Chickens like Dr. Salsbury's Rakos when mixed in the grain. That's important. Rakos is rich in chemicals which check bleeding and tend to reduce inflammation ... other ingredients sharpen the appetite. All of this helps the birds to recover and makes them less subject to become chronic carriers.

Keep a bottle handy for quick action when needed. See your Dr. Salsbury dealer.

Through the Dean's Window

(Continued from Page 1)

it slip a little at the beginning, but anyway I just don't know what it is all about." To the usual, "Have you talked with your faculty adviser?" — "Yes, he said he wished he had a magic wand to wave over me and make me a chemist." Well, that wasn't very helpful, but sometimes faculty advisers are like that, so I only asked, "Well, what are you doing?" Worried Ben said, "I'm attending two dummy classes (students make-up or review classes), am studying a special review book, studying all my class notes, and will get some help from another boy." That is all to the good and I can tell him so; also, "I guess it's just up to you now, dig in your toes and go after it. A lot of others have dug themselves out of the same hole and I think you can, but son it means work from now until finals."

After all, perhaps a freshman ought to worry for I already note that Ben's fresh young school face of last fall is showing lines of character. It's kind of tough to go through, but maybe that is what makes boys into men.

Then something carries my mind back to Leigh who came through the door two or three years ago facing a tragedy in his family. I was at the father's farm when he brought his bride home a year before Leigh was born. He was a big, wholesome, generous, jolly man who belonged on a farm and was happy there. Now, Leigh had been two years in college and came to tell me that his father had died. We talked at length. Leigh felt he must go home to help his mother immediately with the burden of a five-hundred-acre farm. After talking over all the plans for the farm and discussing the organization of the business, possibilities for success, and difficulties that must be met, I said somewhat jokingly, "To succeed on a farm, you need a wife—do you have any prospects in that field?" Without the least hesitation, Leigh answered, "I'll know by nine o'clock tonight. I'm going to see my girl, and I'm going to know where I stand before I leave." I wished him good luck and said goodbye after asking him to write when he had a chance.

For a year there was no news, so I dropped him a very short note saying I'd like to know how he was getting along on the farm. In a few days I had a letter mailed in another state saying that Leigh and his girl were married and on their honeymoon. The farm was going fine and all were happy. A year later, I heard indirectly that a baby boy had arrived.

Last summer I happened to drive by Leigh's home one Sunday morning and stopped for twenty minutes. Leigh came to the door—big, brown, and muscular, the picture of health, weighing 175 pounds and looking much as his father did on that same porch twenty-five years ago; a five-hundred-acre farm in much better condition than when his father started it, eighty head of purebred cattle, an old farm home large enough for three families, and a wife and son that he could well be proud of.

That community needs Leigh and Leigh needs the open country. He would be unhappy and stifled inside a factory. I suspect that the baby boy is already headed towards an agricultural college.

And so they come and so they go,

Douglas, Louis, Ben, and Leigh, all fictitious names, but none of them fictitious persons. Verdant and uncertain during the first months, slowly gaining poise and confidence during the year. As sophomores, juniors and seniors, they grow and develop, make friends, assume as much leadership as is possible, and leave at the end of four years to make room for the ever fresh and new class that comes after them. Are they really a little more serious than their fathers whom I knew, or is it that I just don't see them in their relaxed moments? I am sure of several things. This present crop is better prepared in high school, they have much better poise, they speak more easily in class or in public, they are franker, and they are better behaved than their dads or their dad's friends when we were in college. So, if even in your pessimistic moments you become discouraged over the youth of today, come to the College of Agriculture and sit in my office while the boys and girls of the present college generation pass by in their daily life on the campus. Observe them, talk with them, go to class with them, and you will end the day with more faith in the youth of today.

Going Once, Going Twice, SOLD!

(Continued from Page 6)

or fair market price at an auction, all of the apple buyers and consumers find it out and come to get some of the bargains, or in the case of the consumer, insist that the bargain be passed on to them. That in turn does two things. It brings buyers to your next auction sale to build up prices to their proper level, and it keeps consumption balanced and in line with the supply and price.

The private sale method acts as a brake on such market readjustment. If a buyer finds a bargain, he does not tell his competitors about it, neither does he pass the benefit along to his consuming trade till he is forced to do it. He prefers to handle a small volume at a wide margin of profit, while the grower is crying for just the opposite in order to move the fruit before the season is over. Auction sales are the only way we can break this stranglehold the distributor has on our crops.

It Has Been Tried

Fortunately, the G.L.F. and some other agencies have established auctions so they are in existence to serve our need. Their records are open for

ENGLISH LEGHORN FARM, Box 2, Richfield, Pa.

(Continued from opposite page)

our inspection, and their experience over the past few years is a fair guide as to what we may expect if we have sense enough to use this service. The only thing that is lacking to get the most benefit from the auction method of selling and from the existing facilities is the lack of cooperation on the part of the growers, the men for whose benefit these auction blocks were established. In a democracy such as ours, there is no way to force a farmer to save himself, or cooperate for the good of himself and his neighbors, but I do hope we can educate enough apple growers to make an intelligent use of this particular marketing facility, THE AUCTION, in time to prevent a collapse of the apple market this coming season.

I want to hear those words Going, Going, Gone! cried out over apples, not farms.

Grange Gleanings

(Continued from Page 3)

a total of fully 1,000 patrons. The day's schedule included conferring of degrees, a fine speaking program and plenty of choice entertainment.

CONFERRING of the fifth degree by Washington County Pomona in Rhode Island, May 9, was rendered especially attractive by a beautiful new curtain, which was the more noteworthy from the fact that its center decoration was a farm scene which proved to be a beautiful picture of the homestead of former State Master W. B. Babcock of East Greenwich. The buildings painted true to life, with the surrounding hills and valley, made a scene which was greatly admired by all those in attendance at the Pomona meeting.

ECHO GRANGE treasury (Connecticut) is \$96 richer from the results of a mock trial recently staged entirely by the brothers of the Grange. One of the prominent men of the town was charged with the serious crime of stealing a mince pie from the Grange pantry and was ably defended by the chaplain of the Connecticut State Grange, Rev. Charles A. Downs of Windham.

TWO NEW JUVENILE Granges have just been added to the roll in New Hampshire, one at Derryfield and one at Cornish Flat, both instituted by Mrs. Lillian Foss Cooper of Rochester, State Juvenile Superintendent. The charter lists were sizeable and a promising start has been made in each case.

NEW YORK State has a new subordinate Grange, Delaware Valley, No. 1565, in Delaware county, which was given a good start May 1st. The organizer was Deputy W. L. Cleveland of Bloomville and the new secretary is Marion I. Mattice of Roxbury.

MANY NEW YORK Patrons were pained to learn of the serious injury of Harold Craig of Clinton, who was run over by a tractor which he was operating, suffering several crushed ribs, fractured shoulder and other injuries. Mr. Craig is Grange deputy for Oneida County, is widely known among the subordinates of that section and is one of the most faithful of Empire State Patrons.

Jams and Jellies

By
Mrs. GRACE
WATKINS
HUCKETT

NOW THAT jelly and jam timber is available, vacant cellar shelves will begin to be occupied once more. Three things are necessary for a firm jelly: pectin, fruit acid, and sugar. Furthermore, these elements must be in the proper proportion.

Fruits and berries which have a natural supply of acid and pectin are tart apples such as the Winesap, crabapples, currants, grapes, gooseberries or plums of the Wild Goose type. Other fruits which have pectin but lack necessary acid are blackberries, raspberries, both black and red, ripe Concord grapes, plums and quinces. One tablespoonful lemon juice per cupful of juice from these fruits supplies the lack of acid. Other fruits with acid but not enough pectin are strawberries, cherries and peaches; also rhubarb, which is not exactly a fruit but excellent acid material for jellies, jams and juices. For this group we must add pectin in the form of pectin extract which we can buy in liquid or powdered form or make for ourselves from apples, using skin, core and all.

With these pectin extracts it is now possible to make jellies and jams from fruits which we formerly thought impossible for these purposes. Just follow carefully the recipe instructions provided with the package.

Currants with raspberries, raspberries with gooseberries, grapes with crabapples, apples with quinces, cranberries with quinces, strawberries with rhubarb are combinations which provide both acid and pectin besides having good flavor and color. Any of these alone would be lacking in one or the other essential.

Equipment such as jelly bags and cooking kettles assume real importance if best results are to be had. A sturdy cotton flannel bag with rounding bottom, French seams outside and 1-inch hem at top can have loops of linen tape firmly attached to hold it up. Broad, shallow pans are preferable to deep ones. Aluminum being a good heat conductor is less apt to scorch. Agate is satisfactory, although it does not heat so quickly as aluminum. Tin affects the color of red juices.

Although each fruit is something of a special problem, certain general rules will cover the process of jelly making. In order to get the pectin of slightly underripe fruit and the flavor and color of ripe fruit, the best jelly is made of juices from both.

GENERAL DIRECTIONS FOR MAKING JELLY

Select and wash fruits. Remove stems, hulls and blossom ends. Cut hard fruit in quarters. Do not pare or remove seeds.

Extraction of Juice

For soft fruit use just enough water to prevent fruit from sticking. Heat gradually, stirring constantly. Crush fruit and cook until it has lost its color. For hard fruit, cook with sufficient water to cover until the fruit is soft. Do not crush if a clear jelly is desired.

Test for Pectin

Test with Epsom Salts: Stir together 1 tablespoon cooked fruit juice, 1 teaspoon sugar, and ½ tablespoon Epsom salts until the salts have been dissolved; let mixture stand for 20 min. A solid mass or large wooly-like particles would indicate enough pectin to make a satisfactory jelly.

Cooking test: Cook a small amount of juice with sugar to see if it will jell.

Jelly meter test: The jelly meter is a small glass tube with markings on the side. Extracted, strained fruit juice is put into this tube and the rate at which it flows through determines whether it has enough pectin or not. It also indicates how much sugar or bottled pectin will be needed to produce a firm jelly. Definite instructions come with package.

Sugar Content of Jelly

Too much sugar will result in a gummy jelly which cannot be molded. Too little sugar gives a tough, dark jelly with an inferior flavor. Currants, unripe grapes, and green gooseberries are about the only fruits which require an equal measure of sugar. Two-thirds as much sugar as fruit juice is the usual rule.

Jelly Test

If the juice "sheets" and two drops hang together when poured from one side of the spoon, the jelly is done and must be removed from the fire immediately. Skim. Temperature on sugar thermometer should be 219° to 221° F.

Work with only a small lot of juice at a time, about 6 to 8 cups. This boils down quickly to the jelling stage, thereby having a better flavor, color, and texture. Good jelly should have a bright color, delicate fruit flavor, should hold its shape, but quiver when plate is moved. It should be so tender that it cuts easily with a spoon, yet breaks with a sharp, clear line.

JELLY FAILURES

Crystals may result from: (1) excess of sugar; (2) overcooking; (3) lack of sufficient acid in fruit; (4) allowing jelly to stand too long before sealing. Cream of tartar crystals in grape jelly may be avoided by allowing juice to stand overnight, then dip it off or strain it. Or can the juice and allow it to stand before making jelly from it.

Weeping jelly may result from very acid fruits, cranberries or currants. No remedy has been found; just put up in small glasses which will be emptied at one meal.

Cloudiness is seen chiefly in the red jellies; strain twice.

Fermentation of jelly is caused by yeast or bacteria. Be careful to: (1) Use sterilized jelly glasses; (2) Protect jelly from contamination before sealing; (3) Seal thoroughly by rotating jelly glass in hand so melted paraffin rolls up to the rim and makes a good seal. New paraffin should be used every year.

JELLY PROCESS

(Without commercial pectin.)

(Loganberry, Raspberry, Currant, and Gooseberry jelly.)

Use sound, slightly underripe fruits. Sort, wash

The family will appreciate some home-made strawberry jam, or some rhubarb and strawberry jam (one of the grand combinations!). Directions for making them are given in Mrs. Hockett's article.

—(PHOTO COURTESY OF GENERAL FOODS)

and crush them. Do not add water, but heat the fruit slowly to the boiling point and then boil for about 3 minutes. Drain through a jelly bag until the juice ceases to drip. Make a second extraction of juice by returning the pulp to the kettle, adding enough water to cover, boiling for about 3 minutes, and draining through the jelly bag. Combine the two extractions and add two-thirds as much sugar as juice. Then follow directions under "Jelly Test".

BERRY JELLY

(With commercial pectin.)

(Strawberry, Red Raspberry, Blackberry or Loganberry)

4 cups juice
7½ cups sugar

1 cup bottled pectin

To prepare juice, crush thoroughly or grind about 3 quarts fully ripe berries. Place in jelly cloth or bag and squeeze out juice. Measure sugar and juice into large saucepan and mix. Bring to a boil over hottest fire and at once add pectin, stirring constantly. Then bring to a full rolling boil and boil hard ½ min. Remove from fire, skim, pour quickly. Paraffin and cover.

RED RASPBERRY AND CURRANT JELLY

4½ cups juice 7 cups sugar ½ cup bottled pectin

To prepare juice, crush thoroughly about 2½ quarts (3½ lbs.) fully ripe currants and raspberries in equal amounts. Add ½ cup water and bring just to a boil. Place fruit in jelly cloth or bag and squeeze out juice. Measure sugar and juice into large saucepan; mix. Bring to a boil over hottest fire and at once add pectin, stirring constantly. Then bring to a full rolling boil and boil hard ½ min. Remove from fire, skim, pour quickly. Paraffin and cover.

GREEN GOOSEBERRY JAM

2 quarts gooseberries 1½ quarts sugar
1 pint apple or currant juice

Wash the gooseberries and remove the stem and blossom ends. Add the juice and boil the mixture until the skins are soft. Add the sugar, and cook until it gives the jelly test. Pour, paraffin and cover.

SLICED STRAWBERRY JAM

4½ cups prepared fruit ½ cup bottled pectin
7 cups sugar

To prepare fruit, cut about 2 quarts fully ripe berries in halves lengthwise, large berries in quarters. Measure sugar and prepared fruit into large kettle, mix well, and (Continued on Page 23)

Simplicity for SUMMER

NOTHING is more charming for summer wear than tailored frocks cut on simple, unpretentious lines. There is something cool about them, something fresh and crisp, no matter how wilting the weather. Cottons are strongly in demand for such purposes.

DRESS PATTERN No. 2761 offers infinite possibilities for interesting color combinations. Very feminine are the dainty blouse and full skirt; trimly casual, the wide belt and buttoned bolero. Sizes 12 to 20 years; 30 to 40 inches bust. Size 16 requires 2 yards of 39-inch material for the blouse; 2½ yards of 39-inch material for the skirt and belt; 1½ yards of 39-inch material for the bolero.

DRESS PATTERN No. 2679 is designed for sizes 36 to 50 inches bust. It makes an ideal frock for everyday, casual enough for morning wear, yet dressy. Its soft blouse and slimming skirt are particularly flattering to the

"Hercules, maybe if we'd change ends it wouldn't do this way."

larger woman. Size 36 requires 3¾ yards of 39-inch material. Embroidery Pattern Emb. 11012 costs 15c extra.

TO ORDER: Write name, address and pattern size and number clearly and enclose 15c in stamps. Address Pattern Dept., *American Agriculturist*, 10 North Cherry St., Poughkeepsie, N. Y. Add 12c for a copy of our new Summer fashion catalog.

Today in Aunt Janet's Garden

Look Ahead!

JUNE is a highly important month for gardeners, both for this year's garden effects and those of next year as well. It has taken me a good many years to realize just how much next year's flowers or fruit depend upon my activities during this whole season here and now.

Take the matter of next year's lilac blooms for instance. Right now, before this year's flowers have formed seeds, is the time to do what pruning and suckering are needed. If those old flower heads are left there, they merely drain the strength of the plant. In

Country Auction

By EDITH HORTON.

She was so neat —
Always if someone came with muddy feet
She'd run at once to bring the pan and broom
To keep immaculate her pleasant room.
Today they sold her well beloved things;
The greedy crowd an auction always brings
Tracked through her house and she, who lately died,
In some far place, I think, was crucified.

fact the whole bush should be shaped—judiciously, of course. Suckers also sap the parent plant. If the plant is a grafted hybrid, root suckers are very apt to be the common lilac which will crowd out the fine variety.

Viburnums, spireas, mock oranges, and forsythias need early pruning also. Furthermore, any of these will be improved if the very oldest branches are cut down close to the ground leaving new and vigorous growth for producing best flowers next year. This helps to avoid criss-crossing of branches and keeps the plant in a more vigorous condition.

Delaying this cutting back of lilacs until too late will sacrifice next year's buds; I know, because I did it myself last year! Pinching out the old flower heads from azaleas and rhododendrons has to be done by hand, reaching down between the two new leaves which form beside every flower cluster.

Next year's peony "eyes" are formed in the roots during this summer; hence the need for keeping up the fertility of the soil by applying a little complete fertilizer and continuing to water freely.

Daffodil and tulip bulbs also form next year's buds now, but they need their foliage for this manufacturing job. That is why the wise gardener does not let her desire for garden tidiness overcome her good judgment, but either braids the untidy dying tops or drapes them under fast growing annuals which have been planted between the bulbs. If the bulbs have become crowded, they may be lifted after the tops have died and replanted in the fall. If not crowded the bulbs are probably better off left in the ground. Daffodils start growing roots surprisingly early; in fact we are now being advised to plant them in late August or early September.

The BEAUTY of PERFECTION

MUFF — A Serial Story

By C. A. STEPHENS

THE STORY THUS FAR

Christened Henry Nemo, the name "Muff" stuck to our hero because his mother tucked him into a muff and abandoned him on the doorstep of two New England spinsters. A crimson birthmark around his neck was referred to by village gossips as "the gallows mark."

When 14 he was hired out to farmer Glinds for \$7 a month. He refused to stay and Glinds refused to pay him. Thereupon Muff stole oats from Mr. Glinds' bin equal to the value of the work he had done. He was discovered, arrested, and sentenced to Reform School. On the way there he escaped.

Muff was captured and sent to the school again, but escaped a second time. After wandering a bit, he stopped to examine the surveyor's instrument used in construction of a railroad, and was hired by Mr. Lothrop, who was destined to have an important influence on Muff's life. When the job was finished, Lothrop wanted to take him home, and Muff confessed he was a criminal.

Mr. Lothrop was not so greatly surprised at this reply; he merely said,—"Haden't you better tell me about it?" "I'll tell you all about it if you will promise me one thing."

"What is that?"

"That you will tell me just what you think I ought to do."

Mr. Lothrop thought a moment. "Very well," he said, "I will."

It cost Muff a great pang to begin, but he did begin and told the entire story, from the theft of the oats, and the Reform School, down to the house-breaking, and all about his scheme to become a robber.

When he had finished, he sat feeling like a condemned felon; he half-expected that his friend would get up and order him out of the tent.

Mr. Lothrop looked grave. He felt sad; it was even worse than he had expected; he felt, too, that he had serious duty to perform, and that his plan of taking Muff home with him must of course be given up. Yet he was aware that he should miss the lad very much.

"I'm sorry that I promised you that," he said, at last.

"But you will tell me?" said Muff.

"You wouldn't follow it if I did."

Muff still had Saco River in his mind. For a moment he wavered, but then said,—

"I shall do exactly what you tell me I ought to do, Mr. Lothrop," and there was that in his voice which carried conviction with it.

A tremendous sense of responsibility stole upon the young engineer's mind,—the greatest of all responsibilities, that of directing, for weal or woe, the course of another human being's life.

For a little time he shrank from it, but could see no other way. There sat Muff, the picture of misery—a soul waiting for its oracle, be it life or death. It was duty to speak, and accepting that duty, the young engineer braced himself and though not without emotion, spoke firmly, like a true man.

"Henry," said he, "I have lived long enough to learn that when a person makes mistakes, bad mistakes like those of yours, there is but one thing to do; go back, take up those mistakes, like errors in striking a level, rectify everyone of them, and then start anew. That's the only kind of repentance which amounts to anything."

"Now, take from the money which you have earned this summer double in value what you stole from the house over in B—, and carry it to those folks."

"Take the balance, all save a dollar

or two, and send it to your old foster-mother up at R—. That poor old lady has had but a sorry return thus far for the care she gave you when a child.

"Then start for Portland; go to the Reform School, ring the bell, call the Superintendent, and when he comes, surrender yourself. Tell him why; tell him that you are going to start fairly and squarely on the bed-rock of solid honesty. Stay there till they offer you your liberty again; and while there, do your work faithfully, study hard in the school, and read good, instructive books as you get time.

"Write me a letter once a fortnight, and tell me how you are getting on; I will answer; we will correspond right along; and finally when you are honorably free again, come to me. I shall meet you as a brother; and we will go in company again—but not till then."

Hard as was the path thus outlined to him, Muff felt that it was the true one.

They separated next morning. Mr. Lothrop would not seem to watch Muff; he had put him on his honor.

Muff did as advised; he even reserved twenty cents for the woman from whom he took the doughnuts; and on his way to Portland called at her house and gave it to her—to her complete amazement.

CHAPTER VI.

IT IS A brave thing to do—to set patiently at work to correct one's mistakes, and even to atone, without compulsion, for crimes. But the boy who has true manly stuff in him will do that; a weakling will not—he will shirk it; and therein lies the difference between the two.

As Muff walked out from Portland to the Reform School on that October morning, after parting from Mr. Lothrop the previous day, he was a prey to many emotions. At times he would stop in the road and stand reasoning with himself. To go back there and be shut up, perhaps for years, seemed idiotic.

"You're a fool!" he said to himself at times. "Nobody but a soft-head would ever do such a thing."

But a clearer voice, from a greater moral height, still said, "Go on!"

At the gate leading into the school farm, came the hardest struggle of all. Once he turned away and went back a short distance, but finally faced about again, and hurrying forward, reached the steps and rang the bell. One of the lady-teachers came to the door. She did not recognize him, and when he asked to speak with Mr. Ascott, the Superintendent, she showed him into the waiting-room.

Mr. Ascott came in presently, and gave a great start of surprise. Muff was probably the last person from whom he expected to receive a voluntary visit. From common impulse both smiled,—Mr. A. rather grimly,—in spite of the serious nature of the business at hand.

"I see that you recognize me, sir," said Muff.

"I do," replied Mr. Ascott: "you gave me pretty good reason to remember you."

"Well, sir, I've come back."

"So I see. Got starved out, I expect."

"Not that, sir: I left a good situation and good prospects to return here and surrender myself."

"What is your motive?"

"I am acting partly upon advice of a good friend whom I have made; also because I think it better for me to serve my sentence."

"If you are speaking the truth, this is greatly to your credit," said Mr. Ascott, unbending somewhat from his constrained manner.

A few moments' further conversation with Muff convinced him of the boy's integrity of purpose. From that moment their relations were friendly and at length cordial.

Muff was re-assigned to his place in the school, and began both to work and to study the following day.

Naturally he felt the restraint considerably at first, and the discipline for a time seemed severe to him. But fixing his mind steadily on the object of his return, he held fast to his purpose, and set to work to get a good practical education in the school, reading library books as he found time for them. Once every fortnight he wrote to and received a letter from the young engineer, sometimes brief, but always good and to the point; and thus a year passed.

The food and sanitary regulations of the school were wholesome; and

The Amateur Poet's Corner

Because of the number of contributions, we do not return poems not published. Keep a copy of your poem.

The limit in length is sixteen (16) lines and poem must be original and written by an amateur. \$2.00 will be paid to the author of each one printed. Check will be mailed on or about first day of month following publication.

Send poems to Poetry Editor, *American Agriculturist*, P. O. Box 367, Ithaca, N. Y.

Sister Saint Luke

She lived shut in by flowers and trees
And shade of gentle bigotries.
On this side lay the trackless sea,
On that the great world's mystery;
But all unseen and all unguessed
They could not break upon her rest.
The world's far splendors gleamed and flashed,

Afar the wild seas foamed and dashed;
But in her small, dull paradise,
Safe-housed from rapture or surprise,
Nor day nor night had power to fright
The peace of God that filled her eyes.

—Mrs. Henry Van Donsel,
R. 2, Cortland, N. Y.

physically Muff took a fresh start, added three or four inches to his height, and both changed and improved in appearance.

Observing Muff's fondness for machinery, the Superintendent on several occasions took him to visit the various machine-shops and factories in Portland and vicinity; and one day they paid a visit to the extensive paper-mills at Brunswick and Yarmouth. This last excursion was a rare treat for the boy; from it he gained ideas which he was able subsequently to act on to advantage.

At the end of the year Mr. Ascott gave him permission to leave the school, if he desired; but Mr. Lothrop was now on the eve of setting off for the South, and strongly advised Muff, since he was doing well in his studies, and needed to make a still further advance in them, to remain till he should return North; for his Southern enterprise, though profitable, was an unpleasant one.

Nearly another year passed,—when for the first time Muff failed to receive his usual letter; he wrote twice more, but heard nothing for five or six weeks. Then came a brief note from Mr. Lothrop's sister, containing the fatal intelligence of his death. The strong, manly spirit was gone out forever.

Muff shed many bitter tears that night; he felt heart-broken. His first and only real, true friend was dead; and with that friend all his plans and hopes seemed buried. For a month he was utterly disconsolate and discouraged; he almost dreaded now to step forth into the world again; all his cherished plans for which he had studied for two years were upset; the motive was gone from them. Mr. Ascott was kind to him, but it was not the kindness which he had received from the young engineer.

But time heals all wounds, and heals those of youth more quickly than those received later in life. As weeks passed, Muff took a calmer view of his loss, and reflected that his present despondent and hopeless mood was not what his dead friend would have approved. "Duty done with honor," had ever been that friend's motto; and it now came to his mind with the sudden keenness of a rebuke, that to remain thus inert was not in accordance with the brave counsels which Mr. Lothrop had so often given him. In one of his last letters to Muff, the engineer had written:—

"If you want to leave the school before I get back North, I should say go up to R—, and fix that matter of the oats with Mr. Glinds; also look after your old foster-mother a little, and let the people thereabouts know that you are all right

The Song of the Lazy Farmer

MY NEIGHBOR says alfalfa hay is what will make your farmin' pay, just give it lime and phosphorus and it will make you prosperous, it just grows on and never stops and gives you two or three good crops; it fills your mow with feed so fine it coaxes milk right out your kine. There ain't no crop that pays so well, you'd think to hear my neighbor tell about the virtues of that hay that it will drive your cares away and pay the mortgage on the place. He seems to think it a disgrace if on your farm you don't produce alfalfa hay for sale or use.

Now as for me, I must admit that all the good that's said for it is mostly true, but even so, of all the crops that I might grow, alfalfa is what I like least. A fellow never is released from hayin', for it grows so fast that hayin' time is never past. You think you've got a breathin' spell when you can rest or fish a

spell, but no, you cannot git away, for puttin' up alfalfa hay. You hardly git the first crop made and start relaxin' in the shade before another must be cut, you toil until you're weary, but you dassen't stop to rest a day or you'll be buried 'neath that hay. A crop of timothy suits me, for when you've put it up, by gee, it quits and doesn't grow no more so that when hayin' time is o'er a feller has a chance to rest, so I'll say timothy is best!

Northeast Markets for Northeast Producers

Holsteins . .

Bulls ready for service, backed by many generations of high production, good test and type. Dams have good C.T.A. records. Females, all ages, for sale.

On free lease for 3 1/2 years, baby sons of Princess' May Royal, 14 year old proved sire whose production index is 16,693.18 lbs. milk, 834.66 lbs. fat on dam-daughter comparisons. To D.H.I.A. dairymen registered bull calves out of cows with records. To non-D.H.I.A. dairymen sons of same sire out of outstanding grade cows with records.

T. E. Millman Hayfields Churchville, N.Y.

DOWN THE

By J. F. (DOC) ROBERTS

ALTHOUGH sheep and lambs, as well as horses and cattle, are playing their part in rounding out a more satisfactory farm income through diversification, they are not playing near the part in the farm programs of the Northeast that they are capable of.

I am often asked how genuine spring lamb can be offered in the butcher shops of the East at any and every period of the year. Through the years, lamb producers have definitely divided themselves into geographic divisions. Beginning about the 15th of May, the Atlantic seaboard, which consumes about half of all the lambs used in the United States, gets its supply from Kentucky, Tennessee and the Virginias. Beginning about the first of July, Arizona, Idaho, Missouri and southern Indiana begin to come into the picture, and then soon after the first of September, the Northeast, Michigan, Ohio and northern Indiana, along with some of the western states, notably Montana and Wyoming, furnish the bulk of the supply up until close to the first of the year; and then from approximately January 1st to May 15th, the so-called "feeder" lamb furnishes the supply from the corn-belt and surplus roughage sections.

A good many other questions are answered in the above paragraph. When should a man in the Northeast breed his ewes, so as to market his lambs at the most advantageous time? Is there a definite place or outlet for lambs produced in the Northeast? What should lambs be, to meet this definite demand? They should be fat and fine, weighing 80 to 85 lbs., because the Atlantic seaboard demands good lambs. It does not want light, inferior classes.

The question that next arises is, "How can these lambs be produced economically in the Northeast?" Probably the most money has been made by using a choice, cross-bred, range ewe, usually bought as a yearling, and bred to pure bred, medium-wooled rams, with the lambs dropping either just before grass time or very soon after; and then never allowing the little lambs to lose their milk-fat, but grown as rapidly as possible through the use of grain creep feeding, if necessary, on pasture, and then sold off ewes, off grass in September or early October. A good many men are not

marketing at this time, but are bringing their lambs in, putting them on feed, and planning to market between Thanksgiving and the first of the year. Usually the market shows some advance during this period, and unless lambs are weighing up 80 lbs. or better, this is a good practice. This program can be followed with 10 ewes just as well as with 100 or more. There is no particular trick about it. The ewes should be dipped and drenched regularly, and the lambs should be drenched regularly. Any of our agricultural colleges would be only too glad to give you this information, if you haven't it.

The other lamb opportunity in the Northeast is buying little western range lambs, weighing 50 to 60 lbs., in the latter part of September, or in October, and feeding them for the market after Jan. 1st. There are now being fed around 150,000 of these lambs in our sections. In fact, they can be fed anywhere where there is an abundance or surplus of rough feed. Any farmer—and this applies to New England just as well as to Northern New York—who has a barn full of good, rough feed, preferably legume hay, can feed lambs and make money over a period of years. This has been very definitely proved. By far the greatest number of our lamb feeders purchase practically all their grains. There is no particular trick about feeding lambs either. They simply demand care, watchfulness and good judgment, starting out with comparatively small amounts of hay when they are unloaded off the cars, but within a few days given all the hay they will eat, and then starting with as low as a quarter of a lb. per head per day of light grains, preferably oats or oats and bran; and then this gradually stepped up until they are getting a half a lb. of these grains. Then heavier grains, such as corn and barley can be added, and within 20 or 30 days they will be getting approximately a pound and a half or a pound and three-quarters of grain per day, of which corn or barley may be from 40 to 60% of the ration. They are then carried on this basis until fat and marketed, usually marketed weighing from 85 to 95 lbs., within a period of 100 to 140 days.

The amount of raw wool consumption on a daily average basis by mills in the New England district, during each of the first three months of this year, was more than double that of the same months a year ago. Perhaps that is the reason that raw wool on farms has advanced 2c to 5c a lb. in the past two or three weeks.

RICH POULTRY FARM

ESTABLISHED 1911
S.C. White Leghorns
Twenty-eight years of breeding behind all stock we sell—and more sold in 1938 than any other year. THE REASON—Large rugged birds, good type, low mortality, consistent heavy production, large white eggs. Every breeder carefully selected and bloodtested. Every male from our own flock of R.O.P. trapnested hens. Official average, pullet year, body weight 4.64 lbs., heaviest in N. Y. State. Our Leghorns are making money on our own 5000-bird farm and on many of the best commercial farms in New York and adjoining states.

Kernels, Screenings and Chaff

By H. E. BABCOCK.

TWO OR THREE weeks ago a chill ran down the spines of a great many farm leaders in the United States, when they read in the papers that the Farm Credit Administration was by the terms of President Roosevelt's Reorganization Plan No. 1 to be transferred to the Department of Agriculture.

Highly Centralized

Leaders who were familiar with the makeup of the Farm Credit Administration knew how highly centralized it is, *how all powers over its vast financing and lending machinery are vested in a single official, the Governor.* They knew, too, from experience how hard it is to keep the United States Department of Agriculture out of politics.

Farm Organizations Act

With the exception, so I am told, of the leaders of the American Farm Bureau Federation, who didn't seem interested enough to do much work, the farm leaders of the United States moved on Washington and the President as one man. Their demand was simple. The independence of the Farm Credit Administration must be preserved. Both the justice of the demand and the earnestness of the farm leaders must have impressed the President and Secretary Wallace.

At any rate, on May 22 Secretary Wallace made one of the most statesmanlike decisions of his career, with the full concurrence, so he said, of the President.

In a formal statement released on May 22, 1939, Wallace, in effect, said that except for the fact that the Governor of the Farm Credit Administration will report to the Secretary of Agriculture rather than to the President if the reorganization order goes into effect, *the Farm Credit Administration itself will remain substantially as independent as it now is.*

Personally, I have never hesitated to criticize Secretary Wallace when I thought he was wrong, and because he and I don't see eye to eye on many things I have had plenty of chances to criticize him. *In the case of his Farm Credit decision and statement, however, I want to commend him most enthusiastically.* He had a chance to be big and statesmanlike and he rose to the occasion.

Farmers of the United States will never stand for political monkey business in the Farm Credit Administration or for pressure brought on them through it to influence their votes.

As a matter of permanent procedure, we have established the practice of growing our pullets at Larchmont and laying them out at Sunnygables. Ross Yaple is in charge of the pullet-raising at Larchmont. In fact, he is the whole works. The picture shows Ross with some of his four and a half months old crossbred pullets which are already laying. Right now Ross has a little short of four thousand birds in his brooder houses and on range. It takes about half his time to care for them in good shape.

Winter Barley Notes

I am writing this on the evening of May 31. As I drove past our winter barley field just before sunset I noticed that it was beginning to turn. Forced, I imagine, by the entire lack of rain during the first three weeks of May, this piece of winter barley was fully headed out on May 20. The way it looked to me tonight, it will be ready for combining well before we are through with our first cutting of hay.

* * *

We will not get a heavy yield of winter barley this year because of the dry weather I have mentioned. It headed out on short straw and the heads themselves are short. We have, however, demonstrated to our own satisfaction that this Virginia strain of stiff-strawed, smooth-awned winter barley will successfully withstand winter conditions around Ithaca, if it is sown on fields which are reasonably protected and quite well drained.

Despite the fact that it may inter-

fere slightly with haying, we shall welcome the harvesting of some winter barley as early in June as it will come along. We have about fifty pigs in our feed lot and we are going to use our winter barley for finishing them off. We have some whey available and it was our experience last summer that we got really very remarkable gains on pigs fed liberally on whey and winter barley.

Two years ago we harvested our first trial plots of winter barley. On one of these plots we sowed the so-called Russian or Polish strain, which is quite popular in Central New York, but which we have discarded because it has such weak straw and such wickedly barbed awns. We did not harvest this

American Agriculturist, June 10, 1939

which is showing up in new seedings? On our farms we have a few fields in which the present stand of hay is from ten to thirty per cent wheat or winter barley. Seedings are poor in these fields. I don't know whether the seedings are poor because they were choked out by the self-sown grain, or whether the grain is showing up because the seedings were killed out by dry weather and gave it a chance. At any rate, it looks as though we shall get a fair first cutting of mixed grasses, clovers, and winter grains, but I can't see how we can get much of a second cutting with such a combination.

* * *

We are all set to start filling our first silo on June 2. We shall first cut the hay off a couple of fields that we wish to plow and put into soybeans for fall silage and then sow to wheat or winter barley this fall. We shall treat this grass silage with a new, specially treated phosphoric acid *which does not corrode metals.* When we are running clear alfalfa or clover, we will drip five quarts of acid onto each ton of material as it goes through the chopper. When we get to grass which isn't over fifty per cent legumes, we will drop down to about three quarts of acid to the ton of green material. And when we chop the heavy stands of self-sown winter grains in which there is very little clover showing up, I think we shall shut the acid stream off altogether.

* * *

Hay is High

Our Hereford heifers are in from Texas. They had a long, hard trip of it. They were eight days on the road; they arrived terribly thirsty, ravenously hungry, and so stiff and sore they could hardly move around. In forty-eight hours, however, they made a remarkable recovery and by the end of a week it seemed to us we could almost see them lay on the flesh.

One thing which interests me in connection with this shipment is the prices which railroads or stockyards charged for hay. These heifers were first unloaded for feed and rest at Cleburne, Texas. Here they were fed four bales of hay at the rate of \$28 a ton. Their next stop was at Arkansas City, Kansas, where they were fed three bales of hay, charged at the rate of \$21 a ton. Then they were unloaded at Hammond, Indiana, where they got two hundred pounds of hay, for which I was charged \$29 a ton. Their final stop was at Hornell, New York, so near Ithaca that it hardly seemed worth while, and here they were fed two hundred and thirty pounds of hay at \$30 a ton. Arriving at Sayre, Pennsylvania,—a short hour's run from Ithaca—the calves had to stand on siding for an entire day.

This experience, it seems to me, vividly brings out the fundamental weakness in the railroad service of the United States. The railroads did a grand job hauling these calves from Texas into New York State. Then they did a miserable job in making the local delivery. It is my experience and observation, and I have had a fairly intimate connection with the movement of hundreds of thousands of tons of freight, that the railroads of the United States, while they can't be beat for long hauls, have completely muffed short-haul service. Perhaps it was inevitable and right that the truck would take this business, but if this is so, railroads might well consider some use of trucks or light engines for completing local deliveries of long-haul business.

trial plot of barley until it was dead ripe. A lot of it shattered and, despite the fact that we got a fine catch of alfalfa, a lot of barley came up in the alfalfa last summer. Since the plot is a small and unimportant one we did not cut the alfalfa on it last summer until very late, not in fact until some of the self-sown barley was ripe enough to shatter. Now two years after we harvested the first crop of winter barley on this plot, there is a plentiful sprinkling of it showing up in the alfalfa. This experience with winter barley self-sowing itself for two succeeding years and living through our Ithaca winters pretty well convinces me of the hardiness of the Polish strain. If only it grew on stiffer straw and was smooth-awned, I would be almost ready to say that it would make a great crop for dairymen who have fairly well drained fields available for growing it.

Have you noticed as you drive through the country the immense amount of self-sown wheat and barley

Milk Cans

In this neighborhood a man, together with the sheriff, is going on milk trucks and taking every can and cover that has the name of a dealer or cooperative association on it. A lot of farmers bought these cans at auctions and paid for them. Is this legal?

A section of the New York state law states that no person shall, without the consent of the owner, use any can belonging to a dealer or shipper which has the name or initials of the owner marked or fastened thereon. The law further states that the owner or his agent may take possession of such cans wherever found. If the can is filled with milk or cream and the person in whose possession it is found does not, upon request empty it, the owner or his agent may dump the can and the seller will be liable for the loss of the milk.

In general where a company name is printed on the can it indicates that it is the property of that company. Therefore, no producer who has been loaned such a can has the legal right to sell it at auction, and it would seem to be wise for producers to refuse to buy such cans either at private sale or auction.

* * *

Agent's Promise

"I bought some silverware from an agent. This set was guaranteed for 50 years and the agent told me that if it wasn't perfect, he would take it back. A reliable jeweler told us that the set was worth less than half of what we paid for it. The agent called and said the company told him to take it back and refund no money. I bought it on the installment plan."

This is another case of an agent making a promise without authorization. Practically all contracts or agreements contain a statement saying that the company will not be responsible for verbal promises made by agents. The courts do not consider that it is a crime to sell stuff for more than it is worth. They maintain it is up to the buyer to check on the price before he signs the agreement.

* * *

Pay After Sale

"I am anxious to sell my farm. I have some literature from the American Land Bulletin of Baldwin, Wisconsin, which states that for \$9.85 they will run a description of my property in the American Land Bulletin. Also entitling me to a list of names and addresses of possible buyers and a three months' subscription to their bulletin."

We suggest that you write to this concern asking them for the names of owners of farms which have been sold. Frankly we can see no reason for paying an advance fee for listing property. Real estate agents are usually glad to take their commission after the property is sold.

* * *

Law on Veal Calves

I would like to ask if there is a New York State law prohibiting the sale of bob veal to be put on the New York State market. If so, why isn't it enforced? If these were kept until six weeks old, they would use up a lot of surplus milk.

There was such a New York State law on the books at one time, but it was changed in 1933 permitting the sale of calves less than three weeks old under the name of "baby veal". They are required to be so labeled. The label must stay on until the animal is offered for sale at retail or cut up for consumption. Also, the law says that anyone selling baby veal at retail must post a sign conspicuously reading "Baby veal sold here," and any public eating place using it must print on the bill of fare "Baby veal served here."

The probability is that, if this law were repealed, it would be violated to

a considerable extent as it was when it was on the books, and other dairy-men would kill calves a day old and sell their hides.

* * *

It's a Contract

"Last fall I signed an agreement to take a correspondence course, then I was sick and was unable to continue so I wrote returning all the lessons and requesting them to cancel the course, which they have stated they will not do."

This letter is typical of a good many we are receiving. It indicates that many who start a correspondence course do not understand that they are signing a contract agreeing to pay for the entire course whether they complete it or not. It is our observation that the less reliable schools do not employ legal action to collect though they do try by persuasion and threats to get their money. In this case, the school has a good reputation and there seems little doubt that they can collect for the entire course if they want to take legal action. This emphasizes the importance of being able to complete the course and being able to pay for it before signing the agreement. Most schools are willing to rewrite the agreement to the extent of allowing the student more time to study and make the payments.

Turn your Beef into Cash

ON A \$2.00 MILK MARKET this cow might be worth keeping. With milk prices low, she becomes unprofitable. But the butcher will pay a good price for her. Why not turn her into cash now, while beef prices remain high?

Pastures are short in most sections and the late dry spring has hurt the clover crop. On many farms there simply is not enough feed to take care of the usual number of cows. No use letting cull cows eat the feed the good cows should have. It's better to feed the good cows well and keep them in shape for the higher milk prices that should be coming along later.

When You Have to Buy Feed

With milk prices at their present level, it is essential to keep grain feeding costs at a minimum by (1) feeding grain only when necessary to maintain condition and milk flow, and (2) getting the most digestible feed possible for every dollar spent. G.L.F. mixes two open formula pasture feeds which provide digestible nutrients at very low cost—20%

Cow Feed which contains molasses; and 20% Summer Dairy, a dry feed without molasses.

When to Cut Hay

Next winter's feed bill is going to depend to a large extent on how much *good quality* hay you have in the mow. Weather is of

course the big factor in determining yield and quality. Time of cutting is next in importance. Agricultural colleges recommend cutting hay as follows:

Timothy. Should be cut at the early bloom stage when most heads are in bloom at the tip ends.

Clover. The ideal time to cut clover is at two-thirds bloom; by all means the cutting of clover should be finished by the time it reaches full bloom.

Alfalfa. To maintain the stand, alfalfa must reach the full-grown stage once each year. Other cuttings should be made in early bloom.

Mixed Hay. Should be cut when the legume, which is most abundant, is at the proper stage.

To get best quality hay it is necessary to cure it rapidly and to retain as many leaves and as much of the green color as possible. Windrow curing requires the least labor, is rapid and conserves the leaves. If the necessary tools for windrow curing are not available, cocking is the next best method.

4 REASONS WHY NOW IS A GOOD TIME TO TURN CULL COWS INTO CASH

1. Beef prices are high, but they can't stay that way indefinitely.
2. Cull cows add to the milk surplus.
3. Often they are disease carriers.
4. They eat feed that the good cows can use more profitably.

AMERICAN AGRICULTURIST

FIVE YEARS FOR \$3.00 — THREE YEARS FOR \$2.00 — PUBLISHED EVERY OTHER WEEK

FIFTY YEARS AFTER

The following poem is taken from "A Doctor's Adventure," a copyright story

By ALBERT J. MARIS, M.D.

AND then he sought the swimming hole
Where many times he duly stole
With Ed and Milt and Jim and Joe
In truant days of long ago
When hearts were young and life was new
And not a care on earth he knew.
No rush or schedules there was known,
No caste or preference ever shown.
No one e'er heard of bathing style
And all were innocent of guile,
No difference here, wise or uncouth —
The simple masonry of youth.

The hand of time had wrought such change
That everything looked queer and strange.
The great elm tree, we loved so well
Whose spreading branches cast their spell

O'er stream and pool and lowing herd —
Whose grandeur beggared spoken word,
Was gashed and broken by the storm,
Ghost-like and strikingly forlorn.

It was a picture of despair
Shorn of its beauty, standing there,
Once dominant in this rustic vale —
The past now holds its thrilling tale.

The hawthorn bush had disappeared,
The leaning stone, as we had feared,
The mulberry bush and poison vine,
The alder copse and single pine.

The sycamores in white and rust
Were victims of the axeman's lust.
The laughing stream once filled to brim
Had run away in liquid whim

And now, embarrassed in its play,
Grass-choked, it worked its weedy way
A truant with a lazy blend,
A lone bittern its only friend.

The old spring board, surcharged with thrill,
That wandered one night from Hodson's mill,
That bowed its back to boost our fun,
And on the up with everyone —

Found just reward and sweet renown
Bridging the stream a furlong down
Near where the turn-pike made the bend
Where the willow trees and water blend.

The swimming hole which loved our play,
Long deserted had pined away,
And driftwood in benevolent mood
Covered its grave as best it could.

He wandered about the dreary place
With aching heart and solemn face.
He turned and listened for a call.
Brooding silence was over all.

With weary feet he strode away —
Sad memories of a summer day
Had hushed and stilled his yearning call
And made his needs look mighty small.

Great spirit of the chainless mind
Why can't your wizard forces find
And coronate the wistful truth,
The great nobility of youth

Whose star of empire knows no bound,
It circles all the world around,
It has no creed, it boasts no plan,
Demands no tribute, wields no ban,

Excepting lessons and all schools
And austere teachers and their rules.
A realm of fantasy and dreams,
Of shady nooks by fishing streams.

Decorum's bans are all unknown
There's not a pain and not a moan,
There's not a discord to console
For everywhere's a swimming hole.

TIGHTEN *your* BELTS

THERE'S REAL WORK AHEAD

Yes, we dairy farmers stand at the gateway to our greatest prosperity—BUT . . .

And there IS a big “but” in it.

For all that the State and Federal milk orders will mean to us will be the chance to control our own milk prices. And WE CAN control them if we understand that WE MUST DO IT.

Chiseling dealers must be made to respect the State and Federal orders. And we are the fellows who must make dealers respect these orders. Because we know they'll be right back at their old tricks of trying to get milk at lower than the agreed price. And if they succeed in getting milk at those destructively low prices, it will be our fault—entirely.

We farmers CAN stop them.

We farmers MUST stop them.

We must all tighten up our belts and say to any selfish or misguided farmer among us who would like to sell milk to the chiseler: “You—too—have got to stand firm with us. You *must* play the game for the good of all.”

We Dairymen's League farmers who have fought this same fight for the past 20 years—and who have fought the same gang of chiseling dealers—know what's ahead. Dealers will not give up control of the surplus without a struggle. For like everyone who has studied the milk question, they know that farmer control of the surplus spells the doom of unfair profits for milk dealers, and the beginning of a LIVING PRICE FOR MILK for farmers.

**Published by the Thousands of
Farmers Who Own, Operate and
Control the Dairymen's League**

ARTIFICIAL INSEMINATION

*It Has Definite Possibilities
but Several Unanswered Problems*

By ED. HARRISON *

ARTIFICIAL insemination has recently commanded the interest of dairymen throughout the country. The idea of artificial insemination is not new. It has been practiced with horses for many years and more recently with dairy cattle in some European countries. The lack of a safe and satisfactory method of collecting semen from the bull and the danger of spreading disease has retarded its general use with dairy cattle in the United States.

A few years ago certain workers demonstrated that it was possible to cause the bull to ejaculate by massaging the ampulla per rectum. Semen collected in this way partly eliminated the danger of disease and attempts were at once made to practice artificial insemination with dairy cattle. It was soon found, however, that certain bulls did not respond to massage. It also proved almost impossible to collect the semen free from contamination.

Just recently an artificial vagina has been perfected which practically solves the problem of semen collection and largely removes the possibilities of contamination and the danger of spreading disease. It has also been demonstrated that when satisfactory semen (not more than 8 to 12 hours old) was used, artificial insemination produced at least as high a percentage of conceptions as direct service.

With the physical problems partially solved, already several large artificial insemination rings have been organized and put into operation. A great deal of fundamental research work still remains to be done. The following are some of the important questions that can not be answered today:

1. How frequently can a bull be used without decreasing the percentage of conceptions?
2. What procedure should be followed in handling the semen from collection to time of use?
 - (a) Should it be chilled quickly? If so, to what temperature?
 - (b) Should the semen as collected from the bull be diluted? If so, what should be the rate of dilution? What diluters should be used?
3. Can semen be handled in such a way that it will produce a satisfactory percentage of conceptions when more than one day old.
4. Will the quality of calves produced from semen that has been held for some time after collection be as satisfactory as calves produced from the same semen when fresh or from direct service?
5. What containers will be necessary for shipping semen for use at distant points?
6. Can simple and quick tests be developed that will be a reliable index to the fertilizing capacity of semen?

Professor Salisbury and his associates in the Department of Animal Husbandry at Cornell are studying these and other important problems connected with artificial insemination.

Those interested in the promotion of this work believe that it has unlimited possibilities. There is no question that the influence of a great sire can be greatly extended by the use of artificial insemination. It should likewise be kept in mind that a mistake in the selection of a bull would practically ruin the herds of every member of the association.

Obviously, the success of an artificial insemination ring depends largely upon the merits of the sires used. A study of the proved sire list forces one to conclude that as yet there is no reliable source of superior proven sires. Of the bulls thus far proven and available very few merit being placed at the head of an artificial insemination ring. If a particular association is fortunate enough to obtain a sire or sires with demonstrated transmitting ability that warrants

their use, the problem is by no means permanently solved. It will at best be only a relatively short time before additional bulls will be needed. Can they be found? Certainly there is no definite and reliable source. If artificial insemination becomes a general practice the limited number of superior proven sires would soon be exhausted. Again, if these artificial insemination rings used only proved sires there would be fewer and fewer young bulls sampled and proven.

Since there can be no reliable source of superior proven bulls it is my opinion that each ring must plan to sample and prove its own bulls. For purposes of illustration, let us assume an artificial insemination ring totaling 1000 cows. In addition to the proven sires selected, the association should select two promising young bulls for sampling. The members should agree to breed 10 per cent of their cows to these young bulls. At the end of the first year these two bulls should be taken out of service and replaced by two more equally well bred young bulls. This practice of sampling should be continued year after year. With proper facilities these young bulls could be maintained at a very moderate cost. As soon as a bull had daughters in production it would be decided whether his transmitting ability merited using him further in the ring. Obviously, no bull should be sampled that was not backed by an inheritance that should entitle him to become a superior sire.

Someone will say that, in theory, this plan is not without merit but would be too expensive to be practical. It is doubtful whether over a period of years this procedure would prove any more expensive than the continued selection and purchase of proven bulls. As the program progressed, a point in development would be reached where it should be possible to select young bulls within the association for sampling. Certainly it would not be nearly as expensive as a mistake in the choice of a bull to be used for unlimited service.

Artificial insemination should not be considered as a cheap means of getting cows in calf. It is very doubtful whether an association organized on this basis would be successful. Certainly such an association could not be expected to make much of a contribution towards the improvement of dairy cattle.

The plan that I have proposed in addition to guarding against unlimited use of an inferior bull would also permit each (Turn to Page 17)

A sample of fresh bull semen covered with a layer of mineral oil.

E. L. Willett of Cornell examining samples of semen under a microscope to determine the motility of sperm and relative number of abnormal sperm present.

Prof. G. W. Salisbury of Cornell diluting a sample of semen, which is done when several cows are to be inseminated from one sample.

Mineral oil is placed over the diluted sample to prevent too rapid interchange of oxygen and carbon dioxide.

—Photo, courtesy U. S. Department of Agriculture.

This shows how sperm cells in a sample of semen appear under the microscope.

When semen is to be used on several farms, it must be gradually cooled and stored in a thermos jug containing water at 50 degrees F.

Hail to Rotary!

MEETING for their annual convention in Cleveland, just about the time you are reading this, June 19-23, are 15,000 members of Rotary from almost every country in the world.

There are few organizations or institutions that have done more to bring about a better understanding and to increase friendliness among both individuals and nations than have service clubs like Rotary, Kiwanas, Exchange and Lions. Many of us can remember when business and professional competitors, both in the towns and cities, feared and distrusted one another even to the point where if one saw the other coming down the street he would cross to the other side. Then someone thought of the fine idea of forming a club to lunch together once a week, not to discuss business and political problems but rather the finer things of life, and to work together for the good of the community.

The idea rapidly spread throughout the world, until Rotary alone, founded in 1905, now has about 5,000 local clubs, with a membership of more than 205,000 in 80 different countries, and includes in its membership business and professional men of every calling, with royalty, government officials, statesmen, authors, journalists — yes, even editors.

The results and achievements of these clubs are beyond measure. Bitter competitors found when they had broken bread and eaten salt together, and discussed problems of the community and humanity that were common to all, that the men who did business next door, and in the next country, had the same ideals, the same hopes and aspirations that they themselves had. Acquaintance led to friendship, and friendship to understanding.

These Rotary ideals, spread throughout the world, are a mighty offset to all of the misunderstanding and troubles among the nations today that are leading to war and rumors of war.

How to Keep Well

NOWHERE in America is there more attention paid to maintaining and improving the health than at West Point Military Academy.

The National Dairy Council states that the average member of the Academy's freshman class, or "plebe" as he is called, increases his height by .4 inch and his weight by 10 pounds. Records are kept of the cadets' athletic ability during the entire four years, and if a cadet shows any deficiency, he is given corrective exercises.

Every cadet gets a full quart of milk every day, and ice cream is served twice a week and oftener if there is a holiday or special meal. An average of 1/6 pound of butter is consumed daily, and fruit, vegetables and eggs are used in liberal amounts.

"What healthy living does for the West Point cadets it will do for anyone," says the National Dairy Council. "Exercises in the fresh air, hours of restful sleep, and an adequate diet based on milk and other protective foods (fruits, vegetables and eggs) will increase one's years of efficient, enjoyable living."

During this month of June, when greatest amount of milk is produced, all hands have joined to increase milk consumption. Thousands of chain and independent stores are pushing the sale of milk and dairy products, and even large business concerns like oil, tire and apparel organizations in no way connected with foodstuffs are donating valuable display space and radio time to the cause of larger milk consumption and more farm prosperity. All of which is just fine, of course, but every month should be milk month,

especially for farmers. An extra quart of milk a day and an extra pound of butter and cheese a week on the farmer's own table would go a long way toward increasing the health of the family and reducing the surplus.

Short Hay Crops

ALL INDICATIONS are for a short hay crop. Plenty of rain from now on will help second cuttings and restore pastures, but it will be too late to save the main hay crop.

This situation makes it all the more important to cut the hay at the right time so as to preserve its quality.

Scientists in the Weather Bureau state that the weather has a habit of running in patterns. Every farmer knows that! When it starts to rain it never knows enough to stop, and, *vice versa*, all signs of rain fail in drought.

One good result of the long spell of dry weather is that it helped to control weeds, and gave farmers an opportunity to get work done.

The Indian Legend Tree

BY THE side of the road on the old Catskill Turnpike in Slaterville Springs (Tompkins Co.) New York, may be seen this old maple tree. A former Slaterville resident remembers the tree as it looked in 1873 and believes it looked about the same size then as it appears today. It grows on the place known as the Deuel farm.

There is a legend that Indians on the trail bent this tree when a young sapling to mark the spot to indicate a good camping ground with a plentiful supply of water, thus enabling other Indian bands following this trail to find a good camp site quickly. The legend also suggests that the way the tree was bent pointed the direction taken by scouting Indians.

Old and twisted and bent it still stands,
The Indian Legend Tree.

As the twig is bent, the tree inclines,
A lesson for you and me.

The picture was taken by Myron E. Howland, Berkshire, New York.

EDITOR'S NOTE: Last time we removed the picture of this Indian Legend tree from most of our issues in order to put in its place a report, coming at the last minute, of the decision of the United States Supreme Court, upholding the milk marketing agreements.

In order that you may all see this interesting picture, we are carrying it in our complete editions this time.

Why Not More Hogs on Eastern Farms?

WHAT DOC ROBERTS has to say on Page 8 about hogs on eastern farms was of particular interest to me, because I have never been able to understand why we do not raise more hogs in this section. When I raise this question with farmer friends they always point out that this is a great fluid milk section and that there is little skim milk with which to raise hogs. The answer to that, of course, is that there is no skim milk in the great hog-raising sections of the Central West. Western farmers put much of the growth on their hogs with good pasture, using corn to harden and fatten them in the last few weeks before market.

I have long been of the opinion that many eastern farmers put too much stress on the production of fluid milk. Those farmers who make out the best and are happiest are the ones who practice more diversification, and I think that one way to do this on many farms is to raise more hogs. What do you think?

Attention Tourists!

AMONG the features at the Eastern States Exposition at Springfield, Massachusetts, which have attracted national interest are the five large buildings representing each of the New England states except Rhode Island, with exhibits typical of their respective states and of New England agriculture and industry. Nowhere else can one get such a good birds-eye view of all New England as he can by a visit to these state buildings on the Exposition grounds.

These state buildings will be open all summer, and may be visited by tourists without expense.

Grangers will be especially interested in the New England Grange building, which also will be open every day from now until Exposition time. New England grangers have a right to be proud of this new building.

If you are planning to take a vacation this summer, why not come to New England? The scenery cannot be beaten by any country in the world, and as for New England folks, there are none better anywhere.

Eastman's Chestnut

EVERYONE is always telling stories on the hired man. I told one in the last issue, and asked for some stories on the boss. I got some good ones. Here is one sent in by Mr. S. H. Murdock of Davenport, New York. He softens it a bit by saying in the last part of the letter:

"It is my belief that farmers as a class are the best providers to be found. Drop in unannounced around meal time on any of your farmer friends and you will surely find a meal fit for a king. I will put the American farm woman up against the most skilled chefs in the world and I'll wager the professional cooks will run a poor second."

I can second the motion to that statement! But here's Mr. Murdock's story. It's an old one, but the old ones are almost always the best ones:

"One morning a farmer saw a neighbor's hired man with a suit case going down the road. He hailed him and asked where he was going, and was told that the hired man was looking for another place to work. When the farmer asked why, this was the answer he got:

"Well, I have worked for Jones three weeks. The first week I was there the old rooster died, so we had chicken dinner. The next week one of his pigs died, and we had pork to eat. Last week he lost a cow, and since then we have been living on beef. Last night Jones' mother-in-law died, so by golly, I'm leaving!"

Better Times for DAIRYMEN

JUST AS the presses of *American Agriculturist* started to roll for our last issue, word came from Washington of the momentous decision of the United States Supreme Court completely upholding the milk marketing act and the marketing agreements based upon it. The decision of the court was not unanimous. Two members dissented concerning the power of Congress to regulate milk prices and to delegate powers to the Secretary of Agriculture; and Justice Roberts and Chief Justice Hughes dissented on a minor point involving milk outside the milk shed. In the main the favorable decision was six to three, and on a few points five to four. A day or two later Governor Lehman signed the Nunan Bill, which corrects the defects found by the New York State court in the Rogers-Allen Law, and makes it possible to re-establish the state marketing agreements and to cooperate with the Federal government in re-establishing the Federal marketing agreement. The agreements will be in force again July 1. We announced most of this great news last time.

Further study of the decision only serves to emphasize its tremendous importance to every dairyman. Had the Supreme Court upheld Judge Cooper, it would have thrown milk marketing agreements out of some 25 big markets throughout the United States, and disrupted the fluid milk market everywhere. As a result of the decision some \$3,000,000 of dairymen's money held up in New England because of the pending court decision will now be released. And will this money come good to farmers at this time!

In announcing its decision, the Supreme Court emphasized some important, long-time principles. It declared:

1. That both the marketing act and the milk marketing orders based on it are constitutional and valid.

2. That equalization, or the pool, is a device "reasonably adapted to allow regulation of the interstate market, upon terms which minimize the results of the restrictions and helps to foster, protect, encourage interstate commerce by smoothing out the difficulties of the surplus and cutthroat competition which burdened this marketing. The pool principle has before been upheld in workmen's compensation, bank deposits, insurance and distribution of benefits in the transportation act."

3. The principle of sharing fluid markets and surplus burdens, the payment of milk according to the purpose for which it is used, and adjusting fluid supply to market demand by manufacturing of sur-

plus, were all approved by the Supreme Court. In fact, nearly all of Judge Cooper's decisions and statements were reversed. The Court dismissed the charges of conspiracy made against the Dairymen's League.

As a result, dairymen can look to sharp increase in milk prices from July 1. In fact, announcement of the decision is already having its psychological effect on June prices. Putting the order into effect July 1 will demonstrate that the order is effective in raising prices in the summer as well as during the fall and winter. Is it any wonder that all over the Northeast dairymen are rejoicing, and we of *American Agriculturist* rejoice with you. We have worked almost day and night, first to get a constructive marketing plan, second to keep it, and third, to get it back after it was thrown out by the lower courts. The decision of the United States Supreme Court is a complete answer to the small minority who were largely responsible for the present starvation prices for milk, and the court decision is also a complete justification of the large majority of dairymen, their organizations, the general farm organizations and *American Agriculturist*, all of whom have worked so hard to get dairymen a living price.

But it should be remembered that these marketing agreements are not cure-alls. With the general price level so low, the best plan in the world will not bring farmers the price for milk that they should have. All the plan will do is to give you all the market justifies and bring milk prices up at least to the level of other prices. There can be no great prosperity among dairymen or other farmers until the general price level rises and good times come again to consumers.

It should be remembered also that the best plan in the world will not bring dairymen even fair prices if they jump in and produce more milk than the consumers will buy. In signing the Nunan bill, Governor Lehman very wisely said in part on increasing production:

"Economic conditions affecting purchasing power change quickly. Milk production, on the other hand, cannot be curtailed so quickly to bring production into balance with market demand. The inevitable result is a recurrence of the same complications that precipitated the first milk crisis in 1933, necessitating state intervention, namely a surplus of milk and diminished purchasing power of consumers.

"During the recent few months of joint federal and state price regulation under auspices of the

MORE DOLLARS FOR DAIRYMEN! That is why *American Agriculturist* asked for the end of state milk control, supported Metropolitan Bargaining Agency activities in the fall of 1937 and the spring of 1938, and worked for the Federal-State milk marketing agreement and for its return after Judge Cooper's decision.

On the graph above, note that state control kept the price of milk (shown by the black line) close to the price level of basic commodities (raw materials) until the fall of 1936. It failed because prices could not be set on milk shipped in from other states.

The Bargaining Agency program, started in the fall of 1937, raised milk prices, but it too became ineffective in the spring of 1938 — again because it was impossible to control outside milk.

The Rogers-Allen law, signed by Governor Lehman May 19, 1937, made the Bargaining Agency program possible by giving cooperatives the legal right to work together. The Rogers-Allen law also provided for a Federal-State agreement if dairymen wanted it, and such an agreement was put into effect September 1, 1938. Prices immediately rose and continued above the general price level until the agreement was suspended last spring. July prices, it is confidently expected, will be at least as high as the general price level.

State Milk Industry Control Law and the National Agricultural Adjustment Act, prices were improved and stabilized. Production, the records show, was increased by individual dairymen to obtain a greater share of this improved market. The sudden termination of regulation by adverse court decisions found production running at ten per cent above the five year average.

"The great overproduction and the collapse of price regulation have combined to reduce farmers' milk returns to approximately their ruinous levels of 1933. If by this legislation and Monday's favorable decision by the United States Supreme Court it is possible to reinstate the recent federal-state regulation, there still will be no assurance against continuance of the unwise and unsound policy of producing more milk than the market can profitably absorb, simply because prices are established and maintained by law.

"The mere establishment of these prices, it should be remembered by dairymen, is no guarantee that all the milk they produce will bring a profitable return. Even under price regulation, either by government or the industry itself, the fundamental principle remains the same that the farmer will be paid for his milk on the basis of its ultimate market utilization.

"In the absence of any official restriction upon production, I believe responsibility rests very heavily upon the industry itself to provide such regulation, if it is determined to solve its problems. This can only be accomplished by a willingness to be genuinely cooperative for the benefit of the whole industry, rather than the enjoyment of temporary selfish advantage.

"It should be apparent to everyone connected with and dependent upon this industry, that no regula-

PLUS VALUE OF ORCHARD BRAND ARSENATE OF LEAD GIVES YOU PLUS ACTION!

APPLE BILL says: "You get double-barrelled action when you use O. B. Lead"

Recent improvements made in Orchard Brand Arsenate of Lead give it *plus* value . . . *plus* action.

What do these *plus* advantages in Orchard Brand Arsenate of Lead mean to you as a grower? Here are a few of the advantages:

- 1. QUICKER KILL**—Worms are quickly killed before they can sting or enter the fruit surface.
- 2. BETTER COVERAGE**—Bare spots are reduced in number by the more closely knit, more uniform coverage on the fruit.
- 3. CONSISTENTLY HIGH "GRADE A" PACKS**—The marked reduction in the cull loss means lower handling or production expense, higher quality fruit, and consequently, greater net return.

Orchard Brand Arsenate of Lead leads all others in sales and performance. Its leadership has been built up by many years of consistently high orchard results . . . proving its quicker and more thorough-acting qualities. This high control efficiency is now evidenced to an even greater extent through improvements in the physical properties. Its flake-like particles, which tend to overlap, reduce the number of bare spots in the spray cover and provide more thorough protection. Write for additional information.

Garden Gossip

By PAUL WORK

ONCE again the mucklands of New York are to claim the attention of the summer tour of the New York State Vegetable Growers Association which is to be staged on Wednesday, July 26th, 1939, in Wayne County,

Paul Work

with 6,500 acres under cultivation and with a wide variety of crops.

The tour will officially begin at the muck of Ralph Perkins of Savannah at 9:30 A. M., D.S.T. Those who wish may stop at the celery washing plant at the Savannah Cold Storage where a crew of colored Florida packers will be seen in action. Perkins' muck includes over 700 acres of crops, is handled with large scale machinery. Other farms belonging to G. Fred Wright and Peter Donk and Son will be visited. Both Skinner type and whirling head irrigation will be seen.

The next stop will be with Colburn Brothers at Rose with demonstration plantings of the hybrid celery varieties developed at Cornell. Lunch will be at the Sodus Fruit Farm which is now managed by M. E. Buckman, until recently county agent at Wayne County.

In the afternoon, visits will be made at the muck areas of W. P. Rogers & Co., and H. V. Pearsall. The final stop will be at the Northern Wayne Co-operative G.L.F. produce auction at Williamson.

Many local associations and county agents will be working up parties to see the Wayne County mucklands. The tour is of just as much importance to upland vegetable growers as to any others.

Editor Ed Eastman says "Corn knee high by the 4th of July," but we saw corn knee high by Memorial Day, and that without picking up the leaves to see how high they would go.

Gardens that were started in good season with a few plants from window box and cold frame, offered nice big heads of leaf lettuce by Memorial Day; also radishes from seed, onions from sets, and spinach for greens. Of course, the perennial rhubarb and asparagus have been on for a long time.

Then, by way of contrast, in comes "Beau" Raymond (home garden and canning crop extension man at Cornell) and he reported that he had been making an auto-eye survey of home gardens for a couple of days about June 1st. And what did he find? He observed that 25% of farm gardens had not been plowed; 50% had been plowed but did not show green; only 25% showed vegetable crops above ground. At that time, I could look half a mile, as the crow flies, to see the solid green of the student gardens at East Ithaca. By June 5th, we had beets from transplants 2 inches in diameter—tender and good; moreover the tops of the same beets were really delicious.

So be sure there's dollars in "them thar" garden flats if we would just go after them.

In New Jersey, the season for truck crops is two to three weeks late due to

late frosts and drought, and yields are somewhat less than average. Delayed maturity tends to bring Jersey produce into competition with New York state produce, but reduction in yields favors New York growers and will probably bring as many dollars to Jersey farmers as if the crops had been heavier. Of course, if consumer demand continues to be weak, this advantage to the Jerseyman may be considerably nullified.

Intermediate cabbage states show probable production about 6% under a year ago and somewhat delayed maturity.

With all the talk about lettuce in New York, it is interesting to note that the late group of states which includes New York, has increased its lettuce acreage from 25,000 last year to 27,000 this year. This compares with a ten-year average of 26,000. In New York state, acreage for 1939 is 2,900 acres against 2,400 last year and the 10-year average of 4,800. The early plantings—largely Iceberg—are reported to be later than usual due to weather conditions.

In 1938, the vegetable business brought farmers 22% of the gross farm income from crops. It brought 16% of the cash income from crops. This difference is largely due to the fact that farmers ate \$40,000,000 to \$50,000,000 worth of potatoes, and well toward \$200,000,000 worth of farm garden produce.

The price index record of vegetables is also very satisfactory;—the figure for 1938 stood at 101 compared with 100 for the period of 1909-1914. The other crop groups;—grain, cotton and fruits,—all stand at 70 to 74.

Potatoes and truck crops currently show some decline in prices both as compared with a month ago and a year ago. This is true although crops are somewhat smaller. Demand is slack in spite of the fact that consumer index figures show some rise about a year ago. The government report raised the question whether the increase in consumption of frozen and canned perishables may not be partly responsible for this situation.

The good showing of vegetables as regards dollar income and price index is interesting in view of the fact that the business has not been under important government subsidy. Where payments are made, the amount per acre is rather small as compared with the returns from vegetable crops for market.

The locker room in a modern frozen food locker plant. Lockers are rented, and frozen meats, fruits and vegetables are kept in them until needed.

QUICK FREEZING of FOODS

By C. W. DU BOIS,

New York State Agricultural Experiment Station, Geneva, N. Y.

WE HAVE begun to hear a good deal about the preservation of meat, fruits and vegetables by a method other than canning, namely freezing. This idea is not entirely new. For years our forefathers preserved much of their meat, hanging it in the woodshed in the fall to freeze. Though they could not control the temperature, the meat was kept and used as needed during the winter months. Yes, the meat did become a bit dry, but it tasted fairly good in spite of the varying temperatures. As far back as 1861, a man applied for a patent for freezing meat and fish, but not until the 1920's, with the rapid development of mechanical refrigeration, did preservation by freezing really begin to grow. Fish and meats were the chief products frozen then.

The freezing of vegetables and fruits is relatively new. Contrary to the universal opinion, freezing does not ruin most fruits and vegetables if they have been properly prepared for the process. Some vegetables which have a high water content, such as cucumbers, melons, and tomatoes, still cannot be frozen successfully. All vegetables, in order to prevent them from developing a brown color and bad flavor in storage, must be scalded or blanched before freezing. The purpose of blanching is to inactivate the plant enzymes which help carry on the life processes and produce the bad flavors and brown color in untreated products. The various vegetables require different lengths of time to inactivate completely the enzymes.

To preserve the flavor and quality

in most frozen fruits it is necessary to add sugar or sugar syrup. The sugar adds the necessary sweetness for palatability and also helps preserve the flavor and color by reducing the oxidation or self-digestion.

All products, whether meat, vegetables or fruits, to prevent drying out, absorption of foreign flavors and to preserve quality, must be packed in moisture-vapor-proof containers.

Freezing is developing rapidly over the United States, and with this development there will be a number of changes which will affect the farmer. As I see it there are three ways in which a farmer will use freezing as a way to make a living.

First: The production of fruits and vegetables for commercial packing. This, I expect, will be no small figure. In New York alone, the production has expanded from practically nothing in 1931 to approximately thirty-seven million pounds of fruits and vegetables in 1938, which is about fifty per cent of the country's frozen pack. However, if New York farmers are to hold this place in production of these products, they must grow varieties which are especially adapted to freezing, or we shall see the packers moving elsewhere to find the desired varieties.

Second: The development of the locker plant in some sections as it is used in the West. The freezing and storing in a locker plant provides a way for the farmer to utilize home-grown produce for a subsistence type of living. It permits him to have available his own fresh meat, fruits and vegetables throughout the year.

Third: Farm holding boxes have possibilities for marketing quick-frozen products on way-side markets. Products would be kept fresh longer, and it would abolish the enormous waste connected with fresh fruits and vegetables. In the Hudson Valley and in sections

(Continued on Page 11)

A city consumer buying quick-frozen foods. In 1938 about 74,000,000 lbs. of fruits and vegetables were quick frozen for commercial sale.

TO BE SURE OF COMPLETE HEATING COMFORT Happy Heating at a New Low Cost

A UTICA HEATING SYSTEM assures you of complete heating comfort and you can install one right now for as little as \$10 per month, with no payments until fall and as long as three years to pay. UTICA HEATING SYSTEMS are economical both in first cost and in the amount of fuel they use. Don't neglect this opportunity to secure Happy Heating on easy terms and at comparatively small cost. Send the attached coupon today.

STEAM or HOT WATER Burn Coal, Oil or Wood

You can secure any type of UTICA HEATING SYSTEM you desire... steam, hot water or vapor... to burn coal, oil or wood. UTICA HEATING SYSTEMS are noted for their scientific design, economy of operation and lasting quality. With a UTICA HEATING SYSTEM, you can be sure of a comfortably heated home for many years to come. Our dealers can change over your present heating plant without fuss or bother and you will not be left without heat during the change. Install a UTICA HEATING SYSTEM now while labor and materials are at their lowest.

Authorized Dealers Everywhere

UTICA dealers are skilled heating men and they will gladly make an analysis of your heating conditions to determine the best type of heating system for your particular home, without obligation to you. All UTICA HEATING EQUIPMENT is **Backed by a Guarantee Bond**. Don't miss this opportunity to investigate, without obligation, how reasonably you can install a fine new UTICA HEATING SYSTEM on easy terms.

DOWN THE

By J. F. (DOC) ROBERTS

HOGS, as well as sheep, cattle and horses, can play a profitable and an increasingly important part in farm cooperation to lessen milk production and thereby help the entire milk price structure. Hogs will convert into good meat ANY surplus feed, as well as milk by-products.

Had the pleasant opportunity the other day of asking about 50 young men, who were taking Dr. Willman's hog course at Cornell University, why they, as future farmers of the Northeast, were taking a hog course anyway. Here are some of their answers: because hogs were the best surplus feed consumers on the farm; because hogs produced cheap meat for home consumption; because they could produce at least a few hogs on their farms as cheaply as anywhere in the United States; and because it was cheaper to ship corn from the West to the East than it was live hogs or pork, etc.

For some reason or other, we in the East do not think of hogs and pasture, or hogs and alfalfa hay; yet they are just as true combinations for efficient meat production, sanitation, exercise and economy as for every other class of livestock. The hog man in the Middle West knows the value of pasture and this knowledge very often spells the difference between profit and loss.

Skimmed milk and buttermilk are ideal supplements to farm grains as hog feed, and 100 lbs. of either is worth 34c on a basis of corn at 84c a bushel, and tankage at 2½c a pound. Whey is worth about half as much per hundred pounds as skimmed milk or buttermilk. Probably as small an amount as 5% of ground alfalfa, hominy or yellow corn should be added to any heavy milk by-product ration in order to be sure of vitamins, particularly if you are feeding over a long period. Hogs can also be put on and off these milk by-products, as your particular condition or situation arises.

Cull potatoes and hogs work into our "better grade of potato" program perfectly. A little over 400 pounds of cooked cull potatoes is equal to 100

pounds of corn or barley in feeding value—raw potatoes are worth about two-thirds as much for hogs as cooked potatoes—and potatoes can be used safely up to four pounds to one pound of concentrates. In practically all good hog rations, from 1/10 to 1/20 by weight of tankage or fish meal is added.

Just by way of showing how rapidly farm people are becoming hog-conscious, in 1925, Buffalo marketed 18,556 New York State hogs; in 1936, 50,516, almost a 300% increase in 11 years, and this increase is continuing. Last year, up until June 1, 25,936 hogs had been marketed, and this year 28,105. Also, just by way of showing how far this increased production in the Northeast is lagging behind demand for the first five months of this year, 947,867 hogs were killed in the New York City area alone, and this does not include those killed around Boston, Buffalo or any other large cities or country points in this area, nor does it include the government estimate of 105,000 hogs killed last year on farms in New York State alone. Surely you will agree with me that the Northeast could and should be producing a larger percentage of these hogs killed in our own sections.

P.S.: Judging by some of the correspondence I have received, this column is guilty of ignoring Shorthorn cattle for beef purposes. Surely this was unintentional. Good, dual-purpose Shorthorn cows and really good Shorthorn steers or heifers for feeding purposes are not inferior to any other breeds. They simply are not generally available in numbers.

Better Times for Dairymen

(Continued from Page 5)

tion, however extensive, can of itself alone restore the milk business of this state to a stable and prosperous condition. The sooner this fact is realized the quicker will be forthcoming that cooperation of dealer with dealer, producer with producer, and both with each other, which is the fundamental necessity to understanding and satisfactory settlement of this whole question.

"I am approving this bill because it provides further opportunity for such cooperation and the instrumentality to make it effective."

Now that we have this plan back again, let's give it a real trial. Let's forget our quarrels and disagreements and all put our shoulders to the wheel

to use this plan and our united front to bring better times into the dairy industry. This is a plea to let bygones be bygones, to shake hands and forget, and turn from the past to the future. In this milk marketing problem we have all made the mistake of speaking harshly of the man who did not agree with us. Let's wipe that all out and start over again. We can do so with the assurance, also, that the leaders of the industry intend to change details of the marketing agreement to correct faults and injustices. If, however, they had stopped to make these changes before putting the agreement back into effect, it would have been at least September before the agreements could have been restored and prices sent upward again. But we know that there is agreement among the leaders to find out where the injustices are and smooth them out as soon as possible.

Dairymen will do well to consider the source of all suggestions that because we have the marketing order, dairy organizations are no longer necessary. Let's consider government help as temporary and hasten the day when dairymen will be well enough organized to handle this job of market stabilization themselves. Pick your organization; then stick to it and demand that your officers work with other organizations to put milk marketing on a solid foundation.

On page 5 is a chart. This chart, with the explanation at the bottom, is by far the clearest picture and explanation of what has happened in the milk business in the last three years. In brief, it shows that every time we had a milk marketing plan it brought milk prices above the general price level, and kept them up there as long as the plan was well supported so that it could control unorganized and outside milk. The chart shows the sharp rise in 1938 when the milk orders were put in effect in September, and it shows the almost vertical plunge of milk prices in the winter of 1939 when the courts invalidated the milk marketing agreements. Now we are sure we can look forward to another rise in milk prices after July 1, when the agreements will be restored and milk prices can be kept up to other prices as long as enough farmers support the agreements. What a grand and glorious thing it would be if we could now have an "era of good feeling" in the milk business.

Jerseys

Production bred Jerseys, Sybil and Owlrest breeding of the 4 highest proven sires of breed in state. Herd ave. 460 lbs. Eleven years of D.H.I. records ave. 414 lbs. on 2 time a day milking. Special prices on bull calves now.

By L. B. SKEFFINGTON

From SKEFF'S NOTEBOOK

Optimism is Keynote of Dairy- men's League Annual Meeting

IN LATER years when historians write a history of the Dairymen's League Cooperative Association the annual meeting at Utica may be referred to as the "Victory meeting." Coming a few days after the decision of the United States Supreme Court upholding the milk marketing program and giving a clean slate to cooperative effort by farmers, there was an air of jubilation that dairymen have not felt in some months.

Holton V. Noyes, State Commissioner of Agriculture and Markets, sounded a keynote when he said "there is nothing new about the principle of cooperation" and later: "the plan is held to be valid in one of the most sweeping decisions of the highest court in the land."

President Fred H. Sexauer made it clear that he did not believe dairymen's fight to obtain a living price for milk was finished, but he expressed great satisfaction that the cooperative principle upon which the League was founded had been sustained. He said the League will continue the fight and will work shoulder to shoulder with all groups of dairymen who are willing to cooperate.

Give Program Fair Trial

Cheers greeted Noyes' announcement that marketing orders would be reinstated July 1. The commissioner also warned that the struggle to obtain fair prices for milk is not a thing of the past. Expressing his view that a voluntary program would be better, he said that dairymen by an overwhelming vote had decided that if a voluntary plan was not practical they wished a government order. To make this effective he advised, the plan must be given a fair trial.

The Commissioner frankly stated that "financial and moral distress suffered by our farm men and women in recent months" was due in large part to the refusal of a minority to give the plan a fair trial. "It seems difficult to square the professed interest of these people in the welfare of the whole dairy industry with the course they pursued which resulted in return of the distressing conditions of 1933. Had their interest in the industry been genuinely sincere, it seems to me they would have taken the means prescribed by law to correct, by amendment, the difficulties they alleged existed, rather than resort to court action to invalidate the whole plan."

"Under our American form of government one of the cardinal principles is that the majority rules. In this particular case we had not merely a majority, but nearly 90 per cent approval. Nevertheless, the small minority, through technicalities raised before the courts, were able to upset the will of the majority."

By resolution the delegates declared the marketing orders had been of great benefit in increasing returns to farmers. They authorized League directors to take action to join in a producers' bargaining agency organized in any market.

Thanks was voted to the Federal Surplus Commodities Corporation for purchase of surplus dairy products for

welfare distribution, and it was recommended that this policy be continued.

For Managed Currency

Another resolution reaffirmed the League stand for a managed currency and a monetary unit of constant debt-paying and purchasing value.

Appropriation of federal and state funds to provide adequate indemnities in eliminating mastitis, bovine tuberculosis and Bang's disease was recommended.

Directors were re-elected, excepting that Edgar Raish of Candor, N. Y., replaces Herman Porter of Lockwood. Roy E. Blocher of Wyalusing, Pa., was elected a member of the membership auditing committee.

Directors re-elected Sexauer for his 12th term, and all other officers were re-elected.

sylvania Secretary of Agriculture, promised cooperation of his department in furthering farmers' aims.

If any of the dealers who were charged with inciting troubles of dairy farmers were on hand their ears must have burned when President Sexauer paid his compliments to them. He referred to the "renegade, bandit, buccaneering tactics of a small minority of dealers and the minority of farmers and their allies, the radicals, the self-seeking politicians, self-appointed politicians and very few publishers."

Sexauer sounded another warning. "Government is going to have more to do with your business, your farm and your income than ever before," he said. "You had better make the selection of your legislative representatives part of the business of operating your farms, helping your organization to protect the price for milk."

Several times Sexauer said that farm organizations should not engage in party politics. He urged, however, that farm groups examine the policies and platforms of parties to see how they stood in regard to interests of farmers, and that individual farmers make sure they knew where their candidates stood.

"Government edict based upon request of a large majority of farmers" is necessary to regulate the milk business, he said, because dealers have spent huge sums of money creating dissension "and thus maintain a big enough minority of farmers to destroy any voluntary plan." The dealer-influenced minority must be controlled. It must not be allowed to destroy a living price for milk. Economic distress of brother farmers makes control mandatory.

League Women Have Program

"All your strength is in union and all your danger is in discord," Mrs. Charles Sewell, director of the Associated Women of the American Farm Bureau Federation, told the meeting of the League's home service department.

She outlined the broader outlook of the rural woman of today as compared to a generation ago when it might be considered that woman's interest was in the kitchen, the children and the church. She urged farm women to acquaint themselves with the work of farm organizations, "because the American farmer and his family must be organized to protect the American farm home, to insure the permanency of agriculture as an industry and to take its proper place in the community."

Miss Vera McCrea, director, welcomed associate delegates to the home service department's meeting and urged upon them their responsibility in carrying on the work of the League.

"Agriculture is just as stable and its opportunities to achieve success and satisfaction from life are just as good as in any other occupation," Paul Taber of GLF told the meeting. He was relating impressions he gathered in attending a conference on jobs and careers attended by young people, as well as his own experience and observations. "We are not afraid of our jobs or our future," he said. "There still is a ladder of success, and fundamentally our goals are the same regardless of our chosen field. I think that those of us directly or indirectly connected with agriculture are apt to have a more satisfying life and a greater sense of independence."

New York News Notes

Delaware County dairymen turned out in numbers for the annual dairy tour on June 9. Two farms were visited. In the morning the farm of F. S. Rose and Son, near South Kortright, was visited, a combination dairy and poultry farm where excellent labor efficiency is worked out and where production per hen has been maintain-

Dairy Field Day at Cortland

The Dairy Field Day and Bull Sale at Cortland on June 10 was well attended. Eighty-seven bulls were on exhibit, but the demand for bulls was a bit slow. Eleven sales were report-

Mrs. Guy Roberts of Cooperstown, N. Y., who won the Ladies Milking Contest at the Dairy Field Day and Bull Sale at Cortland on June 10. Second place was taken by Miss Ruth Breeds of Cortland.

Donald Holdridge of Hartwick, Otsego County, who took individual honors in the 4-H cattle judging contest at the Dairy Field Day at Cortland.

ed, but a number who exhibited said that a year ago later sales were directly traceable to the Field Day.

The program included a softball game won by the River Valley 4-H Club boys of Little York who played against the Jack & Jill girls' team of Johnson City; a band concert by St. Mary's High School Band of Cortland; a ladies milking contest; and cattle judging contests for Future Farmers and 4-H Club members.

ed far above the average. In the afternoon a stop was made at the farm of Frank Todd near Stamford. Mr. Todd grows about 30 acres of cauliflower. Until recently he had a dairy, but last fall he purchased 64 Hereford steers which he wintered on roughage and which are now out on pasture.

Suffolk County duck growers won their appeal for exemption from payment of unemployment insurance to hired men. The Unemployment Insurance Appeal Board ruled that duck farmers are not required to pay the unemployment insurance tax and are entitled to refund of any such taxes already paid.

After 26 years of active service, Professor E. A. White, head of the Department of Floriculture at the State College of Agriculture, is retiring on July 1. He plans to sail for Hawaii to give some lectures and then to visit Java, Siam, India, and the Himalaya Mountains to study and collect plants in those areas.

Raising Milk Returns by Fixing Prices

By LELAND SPENCER

IN THE previous article we suggested that one way of raising farmers' returns for milk was by having the price of fluid milk fixed by public authorities; that is, by restoring the federal and state program of control for the New York milk market. With the favorable decision by the United States

Leland Spencer

Supreme Court and the signing of the Nunan-Allen Bill by Governor Lehman, this is now possible. Secretary Wallace and Commissioner Noyes have announced that the orders will be reinstated on July 1. This is extremely heartening news for dairymen, since it assures them of considerably higher returns for milk for a time at least. Already there is much discussion as to the amount of price increase which may be expected. The actual price to be paid for July milk will, of course, be affected by production and demand for fluid milk, cream, and ice cream, during that month, as well as by the market prices of butter and cheese. Besides, we have no exact information as to the quantities of milk used in the

several classifications in past years by the plants that are affected by the state and federal orders. However, we may as well go 'way out on a limb and set down some rough estimates of the July classification and returns. These are given in the accompanying table.

According to these estimates, the average net return for July, without price fixing, would be about \$1.10 to \$1.15 per cwt. for 3.5 per cent milk. With the control plan back in operation, the returns should average around \$1.45 to \$1.50. In other words, an increase of about 40 cents per cwt. can be credited to price fixing by public authorities. You will notice that the largest part of the increase is obtained from the fluid milk that goes through wholesale channels, where the price is now cut to the bone.

Someone is sure to criticize these figures on the ground that the milk will be used differently when the prices of fluid milk are raised, than it would be used if the prices remained at the present low levels. There is some truth in that argument, and we would be foolish to ignore the effect of price changes on both consumption and production. That will be the subject of an article to appear in an early issue. Just now, I shall only express my opinion that the higher prices will not have much effect upon production or sales of milk during the month of July.

ESTIMATED CLASSIFICATION AND RETURNS FOR MILK DELIVERED IN JULY 1939

Class prices per cwt.*					
Milk used for	Per cent of total	Probable prices without control	Actual or probable prices with control	Gross return per cwt. Without control	Gross return per cwt. With control
Fluid milk, retail.....	26	\$1.45	\$2.00	\$.38	\$.52
Fluid milk, wholesale.....	26	1.20	2.00	.31	.52
Fluid cream and ice cream	20	1.20	1.40	.24	.28
Evaporated milk.....	10	1.10	1.10	.11	.11
Other products.....	18	.90	.90	.16	.16
Total	100			\$1.20	\$1.59
Probable average net returns after deductions				\$1.10-\$1.15	\$1.45-\$1.50

* For 3.5 per cent Grade B milk, 201-210 mile zone.

Milk Production Continues High

For the entire country milk production on June 1 was about 2 per cent higher than it was a year ago. This is a record high production for the date both for total amount and on a per capita basis.

Primarily because of pasture conditions, which on that date were about the poorest they have been in 75 years, June production is expected to decline at a faster than normal rate.

In New York State milk delivered to the larger dairy plants was estimated at 668,000,000 lbs. for May, 1939, 678,000,000 for 1938, 653,000,000 for 1937, 627,000,000 for 1936. These figures are the highest for May for the past ten years with the exception of the year of 1931 when production was 2 per cent higher.

With the exception of 1933, grain fed per cow and per 100 lbs. of milk in New York State on June 1 was the lowest in the nine years records have been kept.

The State Department of Agriculture report shows the average April price of 100 lbs. of milk received by crop reporters was \$1.23, which was the lowest price for April since 1933. State crop reporters indicated that the average price per 100 lbs. of grain ration was \$1.47 on June 1, as compared to \$1.64 on June 1 a year ago and \$2.19

on the same date two years ago.

With the exception of 1936, New York State dairymen on June 1 were raising more heifers per 100 cows than they have since these figures were started in 1930. In New York State the number of cows freshening in March, April and May appears to be lower than a year ago, with the consequent probability that freshening from August to November will exceed figures for the same months in 1938.

From the major sources of cash income New York farmers in 1938 received \$293,329,000. In 1937 the figure was \$322,679,000.

Earlville National Sale

At the Earlville National Sale held on June 3, 85 animals and a few uncataloged baby calves brought a total of \$21,827.50, an average of \$256.

Top price of \$1,625 was paid by Forsgate Farms, Jamesburg, N. J., for Carnation Forecaster, a seven-month-old bull calf. Second high price for bulls was paid by C. E. Eldridge of Pine Plains and Abraham Eller of New Paltz, who paid \$1,000 for a young bull consigned by Elliott Brothers, Woodstock, Ontario.

Top price for females was \$510 paid by Francis Kerrick of Towanda, Pa., for Fultona Betty Calamity Fobes, consigned by W. L. Biddle & Son of Ohio.

46 cows of milking age averaged

\$167.99; 14 two-year-olds not fresh averaged \$200.36; one bred yearling heifer brought \$160; and six heifer calves averaged \$195.

June Crop Report

Wheat—As indicated by June 1 conditions, the winter wheat crop will total 523,431,000 bushels, a drop of 20,000,000 bushels from the May 1 estimate. Last year the crop was 686,637,000 bushels, and the 10-year average from 1928 to 1937 was 560,160,000 bushels.

Condition of spring wheat areas is below average, with the exception of Montana and a few minor spring wheat states. Indicated production is between 145,000,000 and 170,000,000 bushels. Last year production was 244,164,000 bushels and the 10-year average was 192,792,000 bushels.

In New York State quite a loss of wheat was caused by wet, cool weather early in the spring, and dry weather during May slowed up growth. The state production is estimated at 5,460,000 bushels, compared with 7,425,000 bushels last year and a 10-year average of 5,049,000 bushels.

Oats—For the entire country oats on June 1 looked to be about 20 per cent below the 10-year average. Indicated production is between 800,000,000 and 860,000,000 bushels. A year ago production was 1,053,839,000 bushels.

New York State oats were seeded late and the condition of the crop on June 1 was 80 per cent of average, compared to 88 per cent a year ago. On June 1 the barley crop was 79 per cent of average, compared to 87 per cent a year ago.

Apples—Condition of the apple crop is above average in North Atlantic and North Central States, but below average in South Central and western states. Production will probably be equal to or slightly larger than average for the years 1928 to 1937.

In New York State the condition of the crop on June 1 was generally high, although some sections report a light set of Baldwins. Condition of crop was estimated at 85 per cent of normal, compared with 60 per cent a year ago.

Cherries—In New York State the sour cherry crop is estimated at 25,840,000 tons, compared with 15,450,000 tons a year ago. In five eastern states which grow about 90 per cent of sour cherries, the crop is expected to be about 36 per cent above the 10-year average and about 80 per cent above last year's light crop.

Hay—Dry weather has hurt the hay crop, but for the entire country the 1939 crop, plus carry-over, is expected to be large enough for needs in most areas.

Condition of hay in New York is very irregular, ranging from excellent to very poor. In general, northern New York has a prospect for a fair hay crop as do counties of Orleans, Tompkins, Delaware and Sullivan. On the other hand, the hay crop is generally poor in western, southern and central New York.

Potatoes—The Long Island potato acreage is about the same as last year, but the crop is about ten days later in development. It is too early to get much information about the up-state crop.

Canning Crops

On June 1 condition of canning peas in New York was 70 per cent of normal, compared with 85 per cent of normal a year ago. Dry weather has hurt all canning crops. A few beans for canning were planted by June 1. Some sweet corn is up enough to be cultivated, but there is still a lot to be planted the first of the month. Dry weather caused the death of some tomatoes following transplanting. Recent rains will, of course, help the condition of all canning crops.

New York crop of green peas for market is estimated at 556,000 bushels, compared to 532,000 bushels a year ago and a 10-year average of 466,000 bushels.

Quick Freezing of Foods

(Continued from Page 7)

of western New York there are a great number of farm apple storages. I believe that many of these storage plants could be more useful and more economical than they are at present. How? The owners of such plants could build a small well-insulated room in one corner of the present storage. With simple but necessary controls and a separate system of coils, this room could be refrigerated with the same equipment as that used in the rest of the storage. In this way they could freeze and store their own products.

With their own freezers and frozen food storage, these fellows could—in spite of the low prices for fruit—have their own fruit and vegetables on their tables throughout the entire year. After all, who in this world has a better right to enjoy his food at its best than the man who produces it?

Farm Price Index

On May 16 in New York the relation between prices of farm products and farm supplies showed little change. Prices received for farm produce were 84 per cent of pre-war, compared to 85 per cent on April 15, and 89 per cent on May 15, 1938.

Low Fluid Milk Prices

do not compare favorably with returns from Selling Cream and Diversified Farming.

That is why so many farmers are changing to cream.

Cash received for the butterfat in cream amounts to almost as much as some get for the whole milk. Additional returns from feeding the skim milk are better than the average price of farm products.

Sell Cream and feed skim to calves, pigs and chickens for best results.

We offer you our Cash Market for all your cream. Payment made promptly for each shipment at top market price.

The FAIRMONT CREAMERY CO.
BUFFALO, N. Y.

NORTHEASTERN Slants

ON THE National NEWS

■ Supreme Court Upholds Freedom of Assembly

ON SAME day that U. S. Supreme Court gave its verdict in favor of milk marketing control, it handed down another important decision. In a 5 to 2 decision, it ruled that Mayor Frank Hague of Jersey City had violated constitutional right of free assemblage.

Hague case, which grew out of Mayor's refusal to C. I. O. organizers and others to use streets and public parks of Jersey City for meetings, became conflict between city's police power and constitutional rights of freedom of speech and assembly. In handing down its decision, Court declared that Jersey City ordinance violated Fourteenth Amendment, which restricts action of a State, including its cities. It provides:

"No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States, nor shall any State deprive any person of life, liberty or property, without due process of law, nor deny any person within its jurisdiction the equal protection of the laws."

"Liberty" in the amendment has been previously defined by Supreme Court to include fundamental personal rights of free speech, free press, and free assembly.

Although firmly upholding rights of American Constitution, Supreme Court also warned that abuse of these rights may be forbidden by law. (For instance, it has held that a State can punish speakers or writers who advocate overthrow of government by violence or unlawful means.)

■ Lawmakers Swelter in Washington

WITH thermometer doing ninety or better in Washington, Congressmen are struggling with legislative tasks which still face them before they can pack up and go home. High on "must" list are neutrality, taxes, relief, and social security bills. As we go to press, first two of these are still in committee stage, with hearings on them being held. Social Security amendments have passed House hurdle and gone to Senate for action.

Tax revision program is expected to be ready for House shortly. Prospects now are that it will include repeal of undistributed profits tax, authority to corporations to carry over net losses for 2 or 3 years, and some minor concessions to business.

On relief, President has recommended for 1940 a billion and three-quarters, most of it for WPA. June 30 is deadline for enactment, or funds will cease. Senate has been making study of employment and relief, result of which is bill sponsored by Senator Byrnes (Democrat) of South Carolina. On house side, Appropriations Committee has been investigating WPA and has drafted and sent to the House a bill making sweeping changes in relief system. This bill (in compromise form) was passed by House as we go to press.

Neutrality issue is expected to cause the most argument. Administration wants law which will give President biggest say in managing country's foreign policy. Secretary of State Hull has asked Congress to repeal arms embargo against warring nations and to

put sale of munitions on a cash-and-carry basis (cash-and-carry clause of present law expired May 1). Argument advanced against lifting arms embargo and substituting cash-and-carry clause is that it would most aid, in time of war, Great Britain and France, because they could control the seas. Argument in favor of Secretary Hull's proposals is that present law's arms embargo against warring nations would favor aggressor nations by making it impossible for any nation involved in a defensive war with them to buy arms from us.

Farm Bill Still in Conference

Though passed by both Senate and House, farm bill has been in hands of a joint conference committee since May 29. Reason for delay of enactment of bill into law is said to be President's determination not to approve the farm aid increases without new taxes being imposed to cover them. (Senate added to House bill \$220,000,000 for farm parity payments and an additional \$113,000,000 for farm surplus problem, bringing total farm appropriation up to \$1,218,666,572.)

■ Farm Organizations Support Wage-Hour Act Amendments

FIVE national farm organizations—National Grange, American Farm Bureau Federation, National Cooperative Council, National Cooperative Milk Producers Federation, and Agricultural Producers Labor Committee—are back of bill introduced into Senate recently, by Senator Miller of Arkansas, to amend Wage-Hour Act in a way to protect farmers' rights under the law. Miller bill does not propose any fundamental changes, but would put teeth in exemptions which Congress intended to give to farm operations.

An analysis of Miller Bill, issued by above farm organizations, says:

"Congress clearly intended a reasonably broad exemption from wage-hour provisions for farming in all its branches and for the operations necessary to put farm products into marketable form. The Miller bill is little more than a clarification of present act in light of what Congress intended at time of enactment."

In spite of exemptions which original Act grants to agriculture, farmers are being caused hardship under it because of way in which its provisions have been interpreted by Administrator. For example, Section 13(a)10 exempts employees "within the area of production engaged in handling, packing, storing, ginning, compressing, pasteurizing, drying, preparing in their raw or natural state, or canning of agricultural or horticultural commodities for market, or in making cheese or butter or other dairy products." Administrator ruled that farm operations done in establishments employing more than 7 persons, or located in towns with more than 2,500 population, or to which products are hauled more than 10 miles are not "within the area of production." This interpretation has caused all kinds of trouble for farmers and resulted in Administrator finally asking Congress to clarify agricultural provisions of the statute.

Names Exact Operations

In general, purpose of Miller Bill is to express agricultural provisions of Act in such clear words that they cannot be misunderstood by Admini-

strator. One of main things it does is to get rid of phrase "within area of production" which has been used by Administrator as a severe limitation upon operations specified in the Act. Also, Miller Bill specifically names exact operations which are to be exempt from wage-hour regulations. Operations named in bill are all those which are necessary to raise farm products and to put them into marketable form, and whose cost is generally borne by the farmer.

For example, in connection with grains, beans, peas and seeds, Miller bill specifically exempts following operations—handling, grading, hand-picking, cleaning, transporting, or local storing. (It will be remembered that last summer, Genesee County, N. Y., farmers, members of G.L.F. Produce, Inc., at Batavia, fought a losing fight with C.I.O. organizers and National Labor Relations Board to prevent unionizing of employees they hired to sort beans for market. If Miller Bill goes through, it will undoubtedly help to prevent such unfairness under Wagner Act in future.)

SLANT: Miller bill is now in hands of Senate Committee on Education and Labor, and it should have the active support of every farmer and of all who are interested in welfare of agriculture. There are many reasons why farm operations should be entirely exempted from wage-hour regulations, in accordance with Congress's original intentions. First of all, during harvesting season, the farmer cannot control working hours; neither can he control the weather or the market. Second, imposition of wage and hour standards of the Act upon agricultural production and marketing add to the farmer's cost by increasing wages and decreasing hours, and the farmer cannot bear additional costs. Statistics published last April by Bureau of Agricultural Economics show that farm wages are now 117 per cent of the 1910-1914 level, while prices of farm products are only 71 per cent of 1910-1914 prices. At the same time, living and production costs of farmers are 120 per cent of 1910-1914 costs.

■ Voluntary Crop Reduction Works

AN ENERGETIC marketing campaign and voluntary crop reduction have resulted in cutting nation's 1939 crop of canning peas and in moving huge 1938 canned pea pack. Reports already received show that acreage has been reduced 31.8% under 1938 acreage, and weather man may cut it to 40%.

Story of cooperation of pea canners and growers to keep their industry on paying basis goes back to 1937 when a case of canned peas averaged as low as 75c, a drop of 29c a case from 1933 prices. In order to keep bottom from completely falling out of market, canners (who control pea acreage because most of them supply growers with the seed and control planting dates by deliveries) reduced their 1938 plantings. But fine weather produced another huge crop and when the pack was completed last July, there was a new high of 30 million cases of canned peas.

Packers then got busy and formed the Canned Pea Marketing Cooperative, with headquarters at Chicago. They borrowed money from RFC and used it to loan out on warehouse receipt collateral to canners, in order to steady the market and give time for orderly movement of the crop. The Cooperative also worked to make the nation more canned pea conscious. Result, 22½ million cases were consumed in United States during past crop year, an all-time high, and in spite of record pack an average price of 78c was maintained.

This year, the Cooperative sent out an army of young men to interview pea canners. They explained to them the trouble the industry was in from big plantings, and that a decent price could not be secured unless there was a cut in acreage. Each canner was urged to think before contracting for acreage with farmers—taking into consideration his acreage, his own stocks, his finances, and his established markets. Reports from canners later showed the 31.8% cut reported above.

SLANT: This proves that an industry can cooperate successfully when there is the will to do it.

■ Business Gaining

FROM government economists comes cheering news that, after a five months' decline, business has taken turn for better. Ending of recent soft coal strike and a quieter Europe are given credit for improvement.

Leading advance are steel and coal industries. During first ten days of this month, steel orders increased one-fifth. In May, number of contract awards for construction of homes was highest in many years. Prices of farm commodities, after, in April, reaching lowest average price since 1934, came up slightly in May and seem to be holding their gains. Level of farm prices for Northeast will rise again after reinstatement of Federal milk marketing agreement July 1st. Also, outlook for purchases of American farm products is said to be slightly better.

New York World's Fair has its part in summer's upturn, as auto manufacturers plan to introduce their 1940 models earlier this year in order to show them to Fair visitors. This is expected to mean an earlier buying of steel, glass, rubber, etc.

In spite of brighter picture, economists say no real business recovery is in sight—because of lack of confidence on part of private investors. Idle funds, they point out, continue to pile up in banks. Excess reserves of banks last month reached another new high of more than \$4,300,000,000. Demand deposits in leading cities were about a billion dollars above previous record high level reached at end of 1936.

SLANT: The whole thing comes down to a matter of more confidence in the future, and businessmen will not gain that confidence until Government stops its experiments and high spending.

■ Mexico Pays

CHECK for \$1,000,000 was received during fortnight by Uncle Sam—Mexico's first payment for settlement of claims on American-owned property taken over by Mexico since 1927. United States' total claim against Mexico amounts to \$10,000,000, and annual payments of \$1,000,000 have been promised until all is paid.

Not included in bill are U. S. oil lands and properties, taken over last year by Mexico. Negotiations for settlement of that claim are still going on.

■ More Trouble in Czech Land

RECENT killing of a German policeman in a small Czech town near Prague brought severe punishment down on heads of town's entire populace. All open gatherings were forbidden by Hitler's representative in Czecho-Slovakia; schools, movies, theatres and all public places closed; doors and windows of all houses ordered shut from 8 p. m. to 5 a. m.; town's Czech officials replaced with Germans; Czech

police arrested and disarmed; a \$20,000 fine imposed upon the community; 1,000 of its citizens put in jail; and further punishment threatened unless the Czech who shot the policeman gave himself up, or was told on by his fellow citizens. As we go to press, it is reported that a Czech woman has been seized on grounds that she knows identity of the murderer.

Since last March, when Germany walked into Czecho-Slovakia and took possession of it, various incidents have occurred to increase bad feeling between Czechs and their conquerors. Reports are now current of disappearance of thousands of young Czechs from their homeland—all gone to join in other lands a legion for "resurrection of the Czech nation."

SLANT: The Germans may find in time that they have bitten off more than they can chew.

Government Buys More Butter

FEDERAL Surplus Commodities Corporation has been authorized by Department of Agriculture to buy an additional 25,000,000 pounds of butter. This, added to 90,000,000 bought by government during fiscal year ending June 30, will take up all but about 5,000,000 lbs. of total 1938-39 surplus.

Of the 90,000,000 lbs. already bought by government, about 40,000,000 have been disposed of, most of it going to families on relief. Federally financed Dairy Products Marketing Ass'n. holds the other 50,000,000 lbs.

Largest production of manufactured dairy products in history is Department of Agriculture report for 1938-39 season—about 10 per cent above average for previous five years.

New Crisis in Far East

DISPUTE between Japan and Great Britain, which started with latter's refusal to hand over to Japanese four Chinese accused of terrorism, has resulted in Japanese blockade of British and French concessions at Tientsin. Entire population of concessions (120,000, including 5,000 foreigners) were virtually cut off from food and all other supplies last week, and prices skyrocketed. An American press photographer who endeavored to take pictures of blockade was arrested, but later released. British passing Japanese barriers to enter or leave blockaded areas were searched, and in some cases had to take off their shoes and stockings.

Japanese have announced that they will not stop blockade until British "reverse their policy and afford us complete cooperation." British and French have 2,250 troops on duty in concessions, but Japan has a large army of occupation in this North China area, which it won from Chinese in first months of Chinese-Japanese war that started nearly two years ago.

Foreign concessions in Tientsin date from 1860. There are similar concessions in four other Chinese cities. British and other western officials charge that Japan's present action is part of her determination to drive out foreigners, in order to get rid of all foreign competition for China's trade.

Famous Visit

BY FAR, fortnight's biggest news was historic four-day visit of King George and Queen Elizabeth to United States. King and Queen arrived in Washington after three week's triumphal touring of Canada, and in spite of Washington's suffocating heat they bore up nobly under strenuous schedule that had been mapped out for

them. Most dramatic moment of their stay was when George, great-great-grandson of George III, laid wreath on tomb of George Washington.

President Roosevelt, in toast to health of King George, said: "In the life of a nation, as in that of an individual, there are occasions that stand out in high relief. Such an occasion is the present one, when the entire United States is welcoming on its soil the King and Queen of Great Britain, of our neighbor Canada, and of all the far-flung British Commonwealth of Nations. It is an occasion for festivities, but it is also fitting that we give thanks for the bonds of friendship that link our two peoples."

Last Farm Loan Bonds Called for Payment

GOVERNOR HILL of Farm Credit Administration has announced that July 1 will see end of all individual Federal farm loan bonds now outstanding (4½ per cent 10-30 year bonds dated July 1, 1929). The bonds are being called by Federal Land Banks of Louisville and Omaha and represent last of individual issues of the twelve

Federal Land Banks.

For past six years, all bonds issued by the banks have been consolidated farm loan bonds, for which all twelve banks are jointly liable for payment of principal and interest. Since this plan was adopted, says Governor Hill, the Federal land banks have completed a large-scale bond refunding program of great importance to agriculture. "On July 1, 1933," he states, "\$1,141,897,220 of farm loan bonds was outstanding on behalf of individual banks. Of this amount, \$954,381,420 has been refunded with consolidated bonds bearing lower interest rates; and \$187,515,800 will have been paid off in cash when the small issue called for payment on July 1 has been redeemed."

Good Books to Read

DRUMS AT DUSK, Arna Bontemps. A novel of one of the many struggles for freedom among the slaves in Saint Domingue, vividly written against a background of brilliant scenes. — The Macmillan Company, New York. \$2.50.

ROMANCE OF THE NATIONAL PARKS, Harlean James. Now that the time of the annual migration to the state parks has again come around, added flavor is added

to the visits by a perusal of this authentic and well written book. Harlean James has visited most of the areas she writes about, having hiked through the Blue Ridge and Smoky Mountains, the Sierra, Cascades, Southern Rockies, etc. — The Macmillan Company, New York. \$3.00.

THE KING PIN, Helen Finnegan Wilson. Just the kind of story to pack when setting off on a trip, a bouncing tale of family life, full of small incidents, minor triumphs and despairs. The chief merit of the book lies in the picture of Carl Braun, the father of the household, against the background of his numerous family. — The Macmillan Company, New York. \$2.50.

Good Movies to See

THE MIKADO. Since its first appearance in 1885 THE MIKADO has played 550 weeks in New York City alone, and is known and loved all over the world. Therefore, its appearance on the screen, enhanced by the brilliance of technicolor, is something that everyone should try to enjoy.

INVITATION TO HAPPINESS. Featuring Fred MacMurray as a hard-hitting prize-fighter, with radiant Irene Dunne for a wife. The time—speakeasy days to the present.

Mobiloil Gives Engines Balanced Protection

BALANCING A FARM BUDGET isn't easy. But this tip will help: *Get Mobiloil's "Balanced Protection" in all engines!*

Oil with just one or two good qualities may save one way... cost money in others! But Mobiloil, as you see on the blackboard above, brings you *all* good oil qualities!

This oil is distilled, refined, dewaxed, filtered. It is made free-flowing, heat-resisting and clean. Guards against wear, carbon, "oil drag" and "blow-by," equally well!

That's just as important in tractors and other farm engines as it is in cars. It means you *save in many ways*... instead of just one or two! Socony-Vacuum Oil Company, Inc.

MOBIL OIL

A GOOD MAN TO KNOW

Your Mobiloil-Mobilgas Man Has a Complete Line of Money-Saving Farm Products!

MOBIL OIL—gives "Balanced Protection." All good oil qualities—not just one or two.

MOBIL GAS—delivers "Balanced Performance." A scientific blend of every good gasoline quality.

POWER FUEL—special tractor fuel. Smooth, even-burning, powerful, economical.

MOBIL GREASE NO. 2—the all-purpose farm grease. "Half as much lasts twice as long."

MOBIL OIL GEAR OILS—all grades. Highest quality.

KEROSENE—pure, clean-burning. Refined by experts.

WHITE GASOLINE—Finest quality! Clear-burning in gasoline appliances.

BUG-A-BOO—kills insects quickly, surely. Stainless.

SANILAC CATTLE SPRAY—won't irritate eyes or hide. Effective all day long.

He has lower-priced lubricants also—made by the makers of Mobiloil—economical for equipment whose age or condition does not justify the highest grade.

PROTECT THIS "HOT SPOT" WITH MOBIL GREASE NO. 2

Tough Mobilgrease No. 2 resists extreme heat and pressure in cylinder bearings—guards against costly bearing failure.

Northeastern Farmer is Host to World Fair Visitors

H. S. Breckenridge, who has operated his own farms at Meadville, Pennsylvania, for many years, is taking "time off" this year to play the part of "host" to World Fair crowds. He is in charge of the FIRESTONE FARM at the New York World's Fair and is shown in the photograph seated on an Iron Age two-row potato planter, made by the A. B. FARQUHAR COMPANY, Limited, York, Pennsylvania.

Fully stocked and equipped with modern machinery, the Farm shows Fair visitors all the ins and outs of present day farming. A huge cyclorama surrounds the farm buildings, giving the impression of fields stretching away on every side, although the exhibit is in the heart of the Fair grounds.

THE WEYERHAEUSER SALES CO., First National Bank Bldg., St. Paul, Minn., is conducting a contest with \$2,000 in prizes. You can get your official entry blank by using the coupon on page three of the June 10 issue. In the contest you complete the sentence "What I like about genuine White Pine is"

Many subscribers of *American Agriculturist* are regular readers of "I Dare You." The author, William H. Danforth, Chairman of RALSTON PURINA CO., 898 Checkerboard Square, St. Louis, Mo., will be glad to send you a 12-page pamphlet if you will send your name and address and 3c to cover postage. You will find this offer on page 7 of the June 10 issue.

Improvements in oil stoves made in recent years are no less than startling. THE PERFECTION STOVE CO., 7113-C Platt Ave., Cleveland, Ohio, will be glad to send you their booklet "I've Found The Best Way to Cook." Use of the coupon on page 21 of the June 10 issue will save you time.

"We have noticed the photograph of the Electrified Farm on page 14 of your May 27 issue. You will be interested in knowing that the silo shown in this view is a CRAINE KOROK Tile Stave Silo and it is the only silo erected on the New York World's Fair grounds. This new silo was chosen as representing the one substantial contribution to silo construction in many years."

(Signed) H. C. Withington, Craine, Inc. Norwich, N. Y.

There has been a considerable increase in the interest in hog raising in the Northeast, and naturally everyone who raises hogs wants to make money from them. THE NATIONAL DISTILLERS PRODUCTS CORP., Produlac Division, 120 Broadway, New York City, has just printed a four-page folder called "Produlac and Hog Profits." Drop them a post card and they will be glad to send you a copy.

THE CHICAGO FLEXIBLE SHAFT CO., 5600 W. Roosevelt Rd., Chicago, Ill., has available a 16 mm. movie on shearing sheep. By means of close-ups it

shows tricks of the expert shearer—something which often cannot be done in a demonstration because the audience cannot get close enough. The picture is available without cost to any responsible organization interested in seeing it.

A brief history of the axe, containing both useful and interesting information, has been published by the COLLINS CO., Collinsville, Conn. It is called "The Axe—Its Manufacture, Choice and Care." It is yours for the asking.

Going West this summer? Then drop a post card to H. M. Fletcher, Dept. A.A., NORTHERN PACIFIC RAILWAY, 560 Fifth Ave., New York City. Tell him where you want to go, and he will send you booklets and accurate information about costs.

The first Ayrshire cow to produce 7,000 lbs. of butterfat during her lifetime is McDonald Dorothy, bred and owned by McDonald College, Quebec. She is 15 years old and still producing at a good rate. In less than ten lactations, this cow has produced 165,633 lbs. of milk, and 7,003 lbs. of butterfat.

Fruit and crop growers know the essentials of spraying to control insects and disease, but who can keep the details in mind? That is where a spray schedule comes in handy. Grasselli Chemical Dept. of E. I. DU PONT DE NEMOURS & CO., Wilmington, Delaware, has just published a 26-page booklet containing the Grasselli spraying and dusting schedule which has the definite information you will need. Drop them a post card if you want a copy.

Dr. L. S. Palmer of the University of Minnesota has been selected to receive the first annual Borden chemistry award consisting of a gold medal and \$1,000 in cash. Dr. Palmer has done important research work in the relation of a cow's diet to the quantity and quality of milk, the nature and origin of color in milk, cause of butter defects and deterioration of butter in storage, and the physical and chemical properties of other milk products. The award is made by the BORDEN CO. for the purpose of stimulating research in the chemistry of milk.

NEARBY MARKETS for NEARBY POULTRYMEN

Let's "Go to Town" By J. C. HUTTAR

WHEN I get a chance to visit with you folks personally, someone occasionally asks me if I have trouble figuring out what to write about every two weeks. Well, to be honest, I do once in awhile. But it's because my brain is in one of those temporary blank spots (do you ever get them?), and not because there's nothing doing.

J. C. Huttar

This egg marketing business is really a very live one, you know. There's practically never a dull moment in it.

I could tell how the Federal Government has stepped in again to purchase a few eggs for relief distribution (really not many), and how this probably put some confidence in egg values so they have gone up and not down.

I could tell those of you who don't get the government reports, how eggs are piling up in the storage warehouses faster than last year. And that we won't need as many storage eggs next fall because we'll probably have more fresh eggs.

I could give you the latest dope on chick hatching, in case you don't get the monthly hatchery report. I might point out that the April hatch was the highest on record and 18% greater than last year.

And I could suggest that all these facts clearly tell you that you must keep your flock culled closely and manage well this year. And also that we need to stimulate egg consumption in a real and permanent way if poultry keeping is to remain a worthwhile farm enterprise.

But I won't say a word about any of these things except the last one, because I feel that is most important at this time. If you're really interested, write me and I'll give you all the figures and facts about any of the above mentioned subjects which I can lay my hands on.

A Success

Just recently I've been in close touch with activities on the Seventh World's Poultry Congress and Exposition and I'm getting that self-satisfied feeling of being associated with something that is going to be a success. It's always good to ride on the band wagon.

In this Congress I see what may be the last chance for a long, long time for the poultryman to "go to town."

As I have watched the keeping of

chickens become more and more commercial, I have seen a big hatchery industry grow. I have seen egg production increase very fast but egg consumption come along only at a price sacrifice which has taken a lot of the joy out of poultry keeping. I have seen mortality and marketing problems grow into big hurdles for the chicken man to jump.

These things have pointed to some weaknesses in our industry. Don't they say that we absolutely need:

1. Consumer education, propaganda, and advertising to counteract the effect on our customers of some of the advertising of other food producers and processors.
2. Some worthwhile action on our disease problems.
3. At least our share of total public help on other marketing problems. We're helping to foot the public bill.

Now, we have our Poultry Congress and it's going to be a grand show. But it has possibilities of being much more than that.

It has possibilities of drawing so much consumer attention to eggs and poultry that it will increase the use of eggs almost right away. But, what's more important, here's a large and valuable group of workers for our industry. They are headed by an executive committee of business men (the poultry business) who are proving that they can do a good job well. We can't afford to let this organization break up after the Congress. We need continued work in a big way on the problems listed above. They're the best bet we've had yet for unselfish effort and capable work.

How Big?

Now, I've already said the Congress is going to be a success. You ask, "How big?" That depends on the next 60 days' developments. Some of the non-self-supporting parts of the Congress still need financial help to be the big success we're all hoping for.

To continue the wonderful work and the still more wonderful plans which Mrs. Kathryn B. Niles and her Consumer Program Committee have done and are working on for the Congress, every single person who is connected in any way with the poultry industry must "chip in" a little.

The women's meetings at Cleveland this summer must be good enough to attract publicity in all the important papers in the country. The egg and poultry recipe books which Mrs. Niles expects to pass out must be big and attractive. The pageants, the movies, the puppet shows, the style shows, and the 4 transparent kitchens must be so good that folks are impressed.

The paying features of the Congress are assured of adequate finances out of the money collected from exhibitors. Individual Congress memberships must finance the educational and publicity features. A one dollar membership from each person who keeps more than 300 hens would be enough for a real show. If you don't know to whom to give your dollar, give it to your Count, Agent. He'll see that it gets where it belongs. **BUT GIVE IT.**

And what is even more important—talk Poultry Congress, make plans to go to the Congress, and ask your neighbor to go along. Your dollar membership is your admission ticket for as many days as you want to go. The Farm Bureau is conducting a low expense tour, including three nights lodging. Go to the Congress *this year*—to the World's Fair next year.

The more there are on the band wagon the better it will be for us all.

"On your feet, sister! This ain't any sit-down strike!"

NEARBY MARKETS for NEARBY POULTRYMEN

Better Hens

By L. E. WEAVER

ONE of my young nephews recently asked what we can find about chickens to require so much discussion; so many conferences. I expect that most people must feel the same way. The chicken business looks like such a simple matter compared to most other enterprises. Why isn't it simple? All

L. E. Weaver

you have to do is get some hens, give them some feed, gather the eggs and count the profits. Just like that.

Of course the man in the game knows better. He becomes disillusioned soon after he enters the business. Then he quits or he buckles down, learns the rest by experience, and eventually wins out. Year by year competition grows keener; competition of poultry against other types of food; competition of one poultryman against all the others. It is the man who can produce high class eggs and meat and get them to market at the lowest cost who will survive. He learns to keep down costs by getting more eggs from every hundred-weight of feed, to keep down losses by controlling disease, to save labor costs by doing a larger business without hiring more help.

What We Talk About

In the experimental stations and the laboratories of the feed companies, several hundred trained scientists are working all the time to provide poultrymen with feeds that are correct and efficient. It is a great thing when these men get together to compare experiences and discuss the results of each other's work. They can find plenty to talk about. The poultryman who listens in gets a lot of helpful information in a hurry.

Exactly the same is true when you come to the control of diseases, or the construction of poultry houses, the hatching of chicks, rearing, marketing the eggs and meat. New facts and ideas are always coming up. New methods are being tested. Talks and discussions might go on and on for days, and still only the men, but never the topic, become exhausted.

Last week I spent three days in Cleveland at the annual conference on

the National Poultry Improvement Plan (NPIP). Six other men were present from New York State, the largest delegation present. Forty some states had delegates there, and the federal department which administers the plan was well represented.

A most significant fact to me about the NPIP is that it is a getting together on a country-wide scale of poultry breeders without regard to breed or variety. That is not true of any other class of animal breeders. Also, that after a long period of years the breed improvement associations of all the states were able to compromise their differences and work together under a single plan.

This is true, I think, because the entire activity of the plan is centered on one objective, and that is *better birds*. Under the plan we work for birds that are better layers, that lay larger eggs (up to a certain limit), larger birds free of standard disqualifications, and above all, free of Pullorum Disease.

Eastern States Lead

Another impression that the conference gave me was that for the most part the best breed-improvement work is being done in the eastern and Pacific

CAPTAIN ROHANGE—
Rhode Island Poultryman

By SUMNER D. HOLLIS

FROM the bridge of a U. S. Naval mine sweeper, operating in the North Sea, to the successful operation of a commercial poultry farm in Portsmouth, Rhode Island, is a long jump and one that few men could make successfully. Yet, that is exactly the course Captain Robert Rohange chose when, after 45 years of active service in the U. S. Navy, he accepted retirement and sought a new mode of life.

Some twenty years before his retirement he had purchased a farm of about 80 acres, in the town of Portsmouth, and set about 35 acres to fruit trees. The soil, underlaid by hardpan, was not adapted to the growing of fruit and the Captain, as he is familiarly known to the town's people, began to cast around for a new venture.

He tried poultry, in a small way, and with the usual beginner's luck, realized a profit the first year. This caused him to decide on poultry keeping as his

coast sections. There are a few real breeders in all sections of the country, but in the sections mentioned the chicks are mostly produced on honest-to-goodness breeding farms. In the rest of the country they come from large hatcheries. A direct result of the National Plan has been to improve the quality of chicks from the hatcheries, but none-the-less, the well-established breeder will always continue to put out a more uniform quality of chicks, I think.

At the National Plan conference a definite difference in point of view was evident. The men from the big hatchery states want to change the rules so that all breeders or hatcheries who are enjoying the privilege of the U.S.R.O.P. label in selling their chicks must produce all their chicks under some phase of the plan. In this state that would mean that all R.O.P. breeders must also be either a "certified" or a "supervised" breeder. This rule will not fit in well with the program of some of our eastern R.O.P. men. They put up a good stiff fight against the adoption of the ruling but only succeeded in postponing its adoption for two years. My guess is that by that time we will have so adjusted our thinking and our plans that present objections will be removed. I am confident that in any event poultrymen will succeed in reaching a compromise and continue to work together as one group. I am confident also that the Northeast will continue to set the pace in poultry flock improvement.

future business and he went into rapid expansion.

He erected a laying house and increased his flock to 500 layers. Like most men who have gone suddenly into the poultry business, he found that operating a 500 bird plant is quite different from keeping poultry on a small scale. He was beset with practically all the troubles that fall to the lot of the amateur poultryman. Pullorum disease, coccidiosis, roup and cannibalism took their tolls from the flock, but the Captain was persistent and replenished his depleted flock with stock from new sources.

He called on the State Extension Service and adopted their teachings. By 1934, continued experience and study was beginning to show results. Captain Rohange built a new laying house of 500 bird capacity and increased his flock to 800 layers. In the fall of 1934 his houses were filled with as fine a lot of pullets as one would be likely to find anywhere.

The flock started to lay well, only to be hit by the worst combination of bronchitis and enteritis that one could imagine. Mortality was heavy and the birds that survived were worthless from the standpoint of production.

Although somewhat discouraged, Captain Rohange decided to make one more attempt at a come-back. He called in the Extension Poultry Specialist and County Agent and asked their assistance in outlining a system of management from the brooder through the laying period. He then began to look around for the best source of stock that could be found. Finally, he found a flock of Rhode Island Reds of the Parmenter strain that seemed to meet his requirements and purchased 1,000 chicks.

He followed the Extension program faithfully and succeeded raising 500 healthy, vigorous pullets for his laying houses. Profiting from his past ex-

Range Shelters for Pullets

HERE is an inexpensive but handy range shelter for pullets. A range shelter of this type, 10 x 12 ft. square, will handle 125 pullets from the time they are put on range until maturity. This one has a wire floor which keeps the pullets off the ground and serves to protect them against loss from predatory animals. This shelter is light enough so that two men can easily move it to a new location every few days.

Contrary to a fairly prevalent idea, a range shelter with a metal roof is actually cooler than one with a wooden roof. The bright metal reflects the sun instead of absorbing it.

This type of range shelter is simple to construct, is rather inexpensive, and has given excellent satisfaction.

BABY CHICKS

25 years of breeding back of our large Tom Barron White Leghorns. We have 4000 large breeding hens weighing up to 6 lbs. Chicks from these large hens as low as \$6.50; Day Old Pullets at \$13.00; Cockerels at \$2.00. Orders filled promptly. Photos of our Farm sent FREE.

Capt. Rohange—Rhode Island Poultryman

(Continued from Page 15)

perience, he vaccinated every bird before placing it in the laying house and went through the year with a substantial profit. Believing that at last he was on the right track, he determined to breed his own birds in the future.

He purchased, direct from Parmenter, 75 chicks from a special mating in which no bird with a record of less than 250 eggs was used. Records in this special pen ran as high as 325 eggs. From these 75 chicks he secured 28 cockerels of the type desired and mated them with selected females from his previous year's flock. The result left little to be desired.

Pullets hatched in March 1937 were laying in October with over 50 per cent production. From November to June the flock of 800 birds averaged 80 per cent production, and the middle of July were still producing over 50 per cent.

In the 1938 hatching season Captain Rohange hatched 7,500 chicks. He retained 2,500 for himself and sold 5,000 to ten different poultrymen, that he might determine what his birds would do under a variety of conditions. The eggs gave 82 per cent hatchability, and a check-up of his flock and the ten flock owners to whom he sold chicks showed that up to July 1st the total mortality from the 7,500 chicks was less than one per cent. His flock is now certified as Pullorum Free by the State Department of Agriculture.

Last year, in order to allow for expansion, Captain Rohange added a new 1,000 bird house to his plant and wintered from 1,800 to 2,000 laying hens. The house is of the Brunswick type and is the last word in insulation and ventilation.

Although he is 72 years young, Captain Rohange is hale and hearty. Of a strong, robust build, active and alert, his appearance belies his years. In talking with the writer, the Captain stated that he was just starting for a thirty year cruise in the poultry business and expected to carry it through to a successful completion.

The Captain looks over his best male bird.

All the work on this 800 bird plant, including the growing of young stock, is done by the Captain himself, with aid of one boy about seventeen, and a school boy who helps on Saturdays.

The old orchard has been thinned out and offers an ideal poultry range, with plenty of shade for the hot weather months. The chicks are started in batteries for the first two weeks and then moved to colony brooder houses. As soon as they are old enough for separation of the sexes, the cockerels are moved to summer shelters and the pullets allowed to remain in the colony houses. Once the pullets are placed in the laying houses, they are never again permitted to run out on the ground.

All cockerels except those needed for breeding purposes, are sold alive as

BABY CHICKS

(Continued from opposite page)
broilers. Eggs, except during the hatching season, are sold at wholesale by the case.

The fame of this flock of birds has spread through Rhode Island and the adjacent territory, and requests for breeding stock have been heavy. During the past year, it was necessary to turn away several large orders, that the home flock might be expanded.

Eight years ago Captain Rohange knew but little of the poultry business, but the same determination and calm, cool judgment that made him famous in the days of mine sweeping in the North Sea has developed him into a finished poultryman, and today he is once more a Captain—a Captain among poultrymen.

Artificial Insemination

(Continued from Page 3)
association to develop a definite and constructive breeding program.

The history of most of the successful breeding establishments reveals the fact that they have followed a definite line breeding program. It has long been recognized that a similar program is just as desirable for the small breeder. The size of his herd, however, has not permitted him to develop a constructive program because of excessive costs. An artificial insemination ring really becomes a very large herd made up of a number of small units. If properly organized, such rings might permit the small breeder and dairyman to formulate and carry out a more complete and constructive breeding program than has been possible, even in the larger breeding establishments. Since the ring would be composed of a number of different herds it is quite probable that it might be also more permanent than an individual enterprise which would allow a program to be carried to its completion.

Each bull selected should not only be backed by high production but should

be bred so as to fit into a definite breeding program. For example, with a line breeding program each bull selected should carry similar blood lines but not so closely bred that they could not be used on each other's daughters.

Those responsible for the program of an artificial insemination ring should study carefully the programs being followed by successful breeding establishments. These programs provide the most satisfactory guide in formulating the association's program.

I think every dairyman appreciates the seriousness of the task of selecting his next herd bull. He realizes what a mistake will mean to him. The seriousness of this task is multiplied many times when selecting a bull for an artificial insemination ring because his service will not be limited to a single herd. Every effort must be made to prevent an unwise choice of bulls. A serious mistake could practically ruin a whole community.

Egg Production Heavy

Total U. S. egg production on June 1 was about 4 per cent above production a year ago and 1 per cent above the 10-year average. In New York State production per hen on that date, with the exception of 1930, was the highest since records were started in 1925.

Eggs have been moving into storage faster than last year, and are expected to be well over 1938 on August 1, which is about the peak.

For the entire country the number of layers on May 1 in farm flocks were about 5 per cent above a year ago and 4 per cent below the 10-year average.

For New York State the egg-feed ratio for the week ending June 8 was 9.9. A year ago it took 7.4 dozen eggs to buy 100 lbs. of feed, and for the same week in 1937 it took 11.8 dozen. The chief factor in higher egg ratio compared with a year ago is the fact that eggs are bringing about 3c a dozen less.

"Why not? Your relatives ate like hogs the last time they were here!"

Planning for COMPANY

by
MRS. GRACE WATKINS HUCKETT

"COMPANY COMING!" is the signal for pleasure or for pain—all depending on circumstances. An English lecturer traveling recently in this country wrote about us that we are rich in everything except domestic service. Perhaps that is why many of us shrink from extending hospitality which we really feel in our hearts but hesitate to extend because we think it is too much work or too upsetting to busy routine.

Yet if one can have a little time to prepare for guests it should not be too much of a strain. First of all, the rest of the family ought to understand their part in the program of giving the guests a pleasant visit. Even the younger children can do their bit towards entertaining. A recent experience of mine is a good example. The father and mother had to be busy packing suitcases to leave on the same train with me. Son David, aged about 11, was my host for an hour or two. It was evident that this was no new experience for David. He had been trained to think of the comfort of guests. He played games with me, tried to find what radio program I liked and hunted for magazines which he thought would be of interest—all this without any prompting by his parents.

This is only an example of what even young children can be trained to do when it is taken as a matter of course that friends will come to the home and should be made to feel comfortable there. The children can also adapt themselves to the extra household duties or chores adapted to their years and strength.

Too often the whole concern of the mother is about the food. Anybody will grant that food is important, but long after the food is forgotten the memory of a good time will remain. It is wise to lay entertainment plans which may be followed if weather is good but have an alternate choice if the weather keeps everyone indoors. Farm sights and activities usually offer enough of interest to keep little boys and girls busy and happy. Besides these are expeditions into the woods, fishing, picnics by the brook, out under the shade trees or on the porch. In case weather turns unfavorable, have a supply of things to keep them happy indoors—simple games, cutouts, drawing and painting books. Even the picnic can be held indoors by doing a little contriving.

For older boys and girls, a hike to a scenic spot in the neighborhood, fishing, horseback riding, swimming, blueberrying or picnicking offer a list of possibilities, but be sure to have in reserve for them, too, games or other activities for bad weather. If you are lucky enough to have a "rumpus room" in the basement, with some lively games such as pingpong, shuffleboard, or darts, they will make their own amusement.

Plans for a visiting adult should

be laid just as carefully. More books and magazines, quiet games, a deck chair or a hammock out under the trees or on the screened porch, a chance to relax away from the necessary household activities—all these help to give the guest a sense of rest without feeling that he or she is interfering with normal routine.

For a certain amount of normal routine must be maintained. If one knows in time about the impending visit, this routine is less apt to be disrupted since some foods may be made ready in advance. This means extra care in selecting a menu which lends itself to such preparations. The menu will depend to a great extent upon storage facilities available—refrigerator, cellar, etc.

Even if there is no refrigerator, greens may be washed and made ready for salad or for cooking and stored in a bright tin pail tightly covered. They can be kept two to three days at a cool temperature. Berries may be kept over for a short time if spread out on shallow trays. Piecrust all mixed, except the water, can be made up in quantities of 5 or 10 lbs. and kept cool. The same applies to biscuits, pancake, pudding or even cake mixtures; in the case of puddings and cakes, sugar and butter may be creamed together, eggs added and the mixture kept cool while the sifted dry ingredients are kept tightly covered in a bowl or pail. It is then a matter of a few minutes of mixing and baking.

In addition to a jarful of baked cookies, cookie dough may be rolled in wax paper and kept in the

Summer days are company days. By planning meals and recreation ahead of time, they can be happy days for the hostess as well as for her guests.

refrigerator for several days, slicing off enough for a sheetful or two for quick baking. If there is plenty of cream for whipping and a supply of fresh berries or fruit always on hand, the dessert problem need not be a great one. A refrigerator tray or two full of ice cream will take care of dessert for at least one meal.

Another big help is to have a supply of plain cake on hand which may be used with fruits or as a foundation for shortcake. It is also convenient for picnic lunches and keeps fresh for several days if made rich enough to begin with.

A supply of salad dressings, French and either mayonnaise or cooked dressing, should be on hand to use with salad greens, vegetables or fruits. A reserve supply of cheese, macaroni or spaghetti, crackers and a quart or two of white sauce kept for two or three days make it easy to put together a casserole main dish for supper.

The problem of meat is a real one if far from the market and without a refrigerator. In this case one has to rely upon the cured and canned meats and give special attention to dishes which use them in as novel and interesting ways as possible—casseroles, meat loaves, meat salads and the like.

If you are among those lucky people who have a locker for frosted foods, meats, vegetables and fruits then you are always ready for guests, both planned for and unexpected. Even the freezing unit of the mechanical refrigerator will store quite a few of the small packages as they are sold. Their ready-to-cook contents furnish a short cut to meals and could be held in reserve to use after the supply of fresh home vegetables in the crisping pan or pail has been exhausted. In hot weather, an unlimited amount of beverage material needs to be on hand—fruit juices, milk, lemons, tea, coffee and cocoa. If these are kept stored in the coolest available place, one can be sure of a refreshing drink either at mealtime or between meals.

No matter how simple the arrangements may be—and the simpler the better—fresh, well-flavored foods in clean, attractive surroundings, served with a spirit of true friendliness and warm welcome, are the very essence of hospitality.

It is best to plan menus for several (Continued on Opposite Page)

WORK-SAVING MENUS

FIRST DAY

Breakfast	Lunch or Supper	Dinner
Fruit or Fruit Juice	Cream of Asparagus Soup	Roast Lamb
Cereal	Boston Baked Beans	Browned Potatoes
Eggs and Bacon	Perfection Salad	Green Peas
Toast Butter Jam	Rolls Butter	Cabbage Slaw
Coffee Milk	Gingerbread Apple Sauce	Bread and Butter
	Tea Milk	Rhubarb Pie Milk

SECOND DAY

Breakfast	Lunch or Supper	Dinner
Fruit or Berries	Vegetable Soup	Roast Chicken
Cereal	Eggs Baked in White Sauce	Mashed Potatoes
Ham	Asparagus Salad	Buttered Beets
Muffins	Bread Butter	Tomato Salad
Butter Marmalade	Fruited Gelatine Cookies	Bread Butter Milk
Coffee Milk	Tea Milk	Ice Cream-Cup Cakes

THIRD DAY

Breakfast	Lunch or Supper	Dinner
Fruit or Berries	Cream of Tomato Soup	Meat Pie, (onions, carrots, peas, included)
Cereal	Chicken Salad	Baked Potato Spinach
Poached Eggs	Potato Chips	Salad Bowl of Mixed Greens
Toast Butter Jam	Hot Biscuits Butter	Bread Butter Milk
Coffee Milk	Sliced Peaches Cake	Raspberry Ice Plain Cake
	Tea Milk	

inch material; 1 1/4 yards of ruffling.

DRESS PATTERN No. 2704 (not shown) is similar to No. 2705, but comes in children's sizes. Sizes 6 to 14. Size 8 requires 2 yards of 39-inch material, 1 1/4 yards of ruffling.

OVERALL AND JACKET PATTERN No. 2102 is almost an essential for your little boy this summer. The jacket will come in handy over his other clothes, too. Sizes 2, 4, 6 and 8. Size 8 requires 7/8 yard of 39-inch material for playsuit; 1 1/2 yards of 39-inch material for overalls; 1 1/4 yards of 39-inch material and 2 1/4 yards of binding for jacket.

TO ORDER: Write name, address and pattern size and number clearly and enclose 15c in stamps. Address Pattern Dept., American Agriculturist, 10 North Cherry St., Poughkeepsie, N. Y. Add 12c for a copy of our new Summer Fashion catalog. The new bride's book will be a big help in careful planning of a trousseau. For it enclose 10c.

Today in Aunt Janet's Garden

Mark the Resting-Places!

AN OLD-TIME favorite, one which greets us earliest in spring, is the bleedingheart. I hear many women say that they have trouble growing this perennial; yet its requirements are fairly simple. First of all, it is a woods plant in its native state and if we can duplicate woodsy conditions to some extent at least, the happier the plant will be.

Although it will tolerate full sunshine, it likes a little shade but does not relish being choked by a lot of tree roots, Norway maple for instance. It also needs rich, black, loose dirt so that its fleshy, brittle roots will have plenty of room to expand besides having enough food. As for fertilizer, I give mine the same complete fertilizer that is put on the flower borders in general. Even a small root will develop in a few years into a plant with a spread of three to four feet. It is normal to expect the plant to die down gradually after blooming. By August it probably will disappear altogether and its presence underneath the surface should be indicated by a plant label; otherwise it may be damaged by digging.

Oriental poppies also have their resting period in August and need to be plainly marked in order to avoid damage. Like Madonna Lily, Oriental poppies put up a rosette of leaves in the fall. Therefore, transplanting is best done when the root is absolutely dormant, thus giving it time to establish itself and get growth started before cool weather.

Planning for Company

(Continued from opposite page)

days: by doing this, today's work makes tomorrow's work lighter. While preparing asparagus for soup today, clean and cook enough for tomorrow's salad. Left-over roast chicken makes tomorrow's luncheon salad: white sauce appears in today's cream of asparagus soup, tomorrow's baked eggs, and next day's cream of tomato soup. Incidentally, if sliced tomatoes are left over from to-day's salad, they may be cooked with others for next day's soup—and so on.

The menus on opposite page have been planned with work-saving in mind, also with the idea of allowing as much as possible to be prepared in advance of the arrival of guests. They also assume that the farm has its own vegetables, fruits, poultry and dairy products.

Here are the WINNERS!

Finals Announced in A.A.'s Cooking School Contest -- Mrs. Eula Augie, Franklinville, N.Y., Wins First Prize

AT LAST we are ready to announce the names of the winners of cash prizes and diplomas in our American Agriculturist Cooking School, which came to a close in our March 4 issue. When the last examination paper was graded and all scores were added up, we found that 145 contestants had a passing mark of 85 per cent or better. Each of these contestants was asked to write a final letter on the subject, "How the American Agriculturist Cooking School Has Helped Me to be a Better Cook", and cash prizes were awarded on the basis of these letters plus marks in the course.

It has taken us some time to judge the letters. They were so interesting, and so well written, that it was a difficult job to single out the best six; and we want to take this opportunity to commend the letters of all those who did not receive a cash prize. We appreciated every one of them and wish we could have given a prize for each. Furthermore, we are very sorry that space does not permit printing the winning letters.

Following is a complete list of winners:

Winners of Cash Prizes and Diplomas

FIRST PRIZE — \$20.00

Mrs. Eula Augie, Franklinville, N. Y.

SECOND PRIZE — \$5.00

Mrs. Emily A. Pierce, Westport, N. Y.

THIRD PRIZE — \$5.00

Mrs. Charles J. Wolfe, East Rochester, N. Y.

FOURTH PRIZE — \$5.00

Marjorie D. Davis, Center Harbor, N. H.

FIFTH PRIZE — \$5.00

Mrs. Edward M. Parrott, Lake George, N. Y.

SIXTH PRIZE — \$5.00

Mrs. Blanche Newton, West Granby, Conn.

DIPLOMAS AWARDED TO

Mrs. Adah Aldons, Potsdam, N. Y.
Mrs. Myrtle Andrews, West Sumner, Maine.
Mrs. Clyde S. Babcock, East Hardwick, Vt.
Myrtle M. Barber, Dewittville, N. Y.
Mrs. Ira G. Barnes, Massena, N. Y.
Laura Baskerville, Deposit, N. Y.
Mrs. Helen H. Bauder, Dolgeville, N. Y.
Mrs. Frank Benning, Jr., Orchard Park, N. Y.
Mrs. Dorothy B. Berry, Rochester, N. H.
Mrs. Austin Bigsby, Tully, N. Y.
Mrs. Frederic M. Bingham, Middlebury, Vt.
Fern Bishop, Adams, N. Y.
Mrs. Clyde Blasdel, Springville, N. Y.
Mrs. Lawrence A. Blinn, Candor, N. Y.
Esther D. Bliss, Smyrna, N. Y.
Mrs. Inez H. Brimmer, Belleville, N. Y.
Mrs. Emma E. Briggs, Greenwich, N. Y.
Mrs. Irene Brown, Ithaca, N. Y.
Susan L. Brown, Walden, N. Y.
Mrs. Robert S. Buchholz, Wolcott, N. Y.
Mrs. Phebe A. Bunnell, King Ferry, N. Y.
Mrs. Henry J. Bush, Delhi, N. Y.
Loula M. Butler, Cambridge, Vt.
Margaret P. Calhoun, Sherman, N. Y.
Mrs. Kenneth Carnahan, Cherry Creek, N. Y.
Mrs. Carl Carpenter, Springville, N. Y.
Mrs. Chris Collins, Chester, N. Y.
Mrs. Harry M. Covell, Glens Falls, N. Y.
Mrs. Ethel Davis, Mooers, N. Y.
Mrs. Gertrude H. Doty, Middletown, N. Y.
Sara P. Dunn, Corinth, N. Y.
Mrs. Walter B. Dutton, Hillsboro, N. H.
Mrs. Gerald M. Eastman, Star Route, Ellisburg, N. Y.
Mrs. Herman Ehmann, Corfu, N. Y.
Mrs. Ruth H. Everett, Peru, N. Y.
Mrs. Herman Facer, Lyons, N. Y.
Rachael E. Field, Onondaga, N. Y.
Mrs. May Duddleston Fikes, Van Hornesville, N. Y.
Lena M. Finch, Shelburne Falls, Mass.
Mrs. James P. Fleming, Kenmore, N. Y.
Mrs. Theodore Fornwalt, Baldwin, Md.
Mrs. Alice P. Foster, East Williston, N. Y.
Mrs. Claire C. Foster, Kanona, N. Y.
Mrs. Rosamond W. Fowler, Millbrook, N. Y.
Mrs. Carl Fox, Naples, N. Y.
Jessie Gambin, Cabot, Vermont.
Mrs. Murilla T. Gardner, Georges Mills, N. H.
Mrs. Leander B. Glover, Cutchogue, Long Island, N. Y.
Mrs. Marietta Goodman, Wilson, N. Y.
E. Gertrude Graff, Haddonfield, N. J.
Mrs. Agnes Grant, Redfield, N. Y.
Mrs. E. V. Green, Alfred Sta., N. Y.
Mrs. John R. Gregory, So. New Berlin, N. Y.
Mrs. George H. Hamilton, Putney, Vermont.
Mrs. Howard Hamm, Craryville, N. Y.
Mrs. Stanley B. Harris, Glens Falls, N. Y.
Mrs. Ruth E. Hicks, Evans Mills, N. Y.
Mrs. Fenton L. Hill, Worcester, N. Y.
Mrs. George N. Hill, Pine City, N. Y.
Mrs. Jotham L. Hobbs, Fairfield, Maine.
Mrs. Earl H. Hodder, Cobleskill, N. Y.
Mrs. Sven B. Holmstrom, Jamestown, N. Y.
Mrs. Arthur D. Hoose, Hopewell Junction, N. Y.
Mrs. Fred Hopkins, Wallace, N. Y.
Mrs. Howard House, Lodi, N. Y.
Mrs. Marjorie H. Hughes, Clayton, N. J.
Mrs. Grant Jocelyn, Grahamsville, N. Y.
Helen E. Kelly, Bedell, N. Y.
Mrs. Howard Lawrence, Kelly Corners, N. Y.
Clara Lemingwell, Canaan, Conn.
Mrs. Ruth G. Lewis, Ithaca, N. Y.
Miriam Lichtenwalner, Macungie, Penna.
Mrs. Myra W. Little, Shattuckville, Mass.
Mrs. Levi A. Lothrop, Orleans, Vermont.
Mrs. George McDermott, Cazenovia, N. Y.
Ruth McKimm, Canton, N. Y.
Mrs. L. P. Mauer, Bloomville, N. Y.

American Agriculturist heartily congratulates Mrs. Eula Augie, of Franklinville, N. Y., whose letter on "How the American Agriculturist Cooking School Helped Me to be a Better Cook", plus her high marks in the course, won her first prize of \$20.00.

Summer SEWING!

BEIGE and brown shades characterize summer fabrics, although there are some bold color combinations. Coral and poison green are prominent, while dull mist blue is also much in evidence.

Organdy is going strong, flower patterns for daytime, plaids for evening. Rayons are apt to have their floral patterns stylized.

DRESS PATTERN No. 2705 is as refreshing as the crisp white ruffling at yoke and sleeves. Puffed sleeves, a tight bodice and far-flung skirt are charming "little girl" details that will appeal to any young lady. Size 12 to 20. Size 16 requires 3 3/4 yards of 39-

"But, I think we ought to fix Elmer his own place to eat now he's growned up!"

Duty

By Emily R. Estey.

The grass is green, the sun is yellow;
The sky is blue, and the fields lie mel-
low.

My Gypsy soul says, "Out, and away!
There's joy to be had abroad today!"

"Come along by a leafy stream
And see where mirrored iris dream.
Away! See the ripples turn into the
lake!"

And I want to away — but I guess . . .
I'll . . . bake.

MUFF — A Serial Story

By C. A. STEPHENS

THE STORY THUS FAR

Christened Henry Nemo, the name "Muff" stuck to our hero because his mother tucked him into a muff and abandoned him on the doorstep of two New England spinsters. A crimson birthmark around his neck was referred to by village gossips as "the gallows mark."

When 14 he was hired out to farmer Glinds for \$7 a month. He refused to stay and Glinds refused to pay him. Thereupon Muff stole oats from Mr. Glinds' bin equal to the value of the work he had done. He was discovered, arrested, and sentenced to Reform School. On the way there he escaped.

Muff was captured and sent to the school again, but escaped a second time. After wandering a bit, he stopped to examine the surveyor's instrument used in construction of a railroad, and was hired by Mr. Lothrop, who was destined to have an important influence on Muff's life.

On Lothrop's advice, Muff returned to the reform school, where good behavior soon gained his release. During his stay at the school, Mr. Lothrop died. Following his release from school, Muff went back and worked unrecognized for Glinds until he had repaid him for the oats.

* * *

Unknown to Mr. Lothrop, when he wrote last to Muff, old Marcia had died the previous year, slipping out of the world in the same quiet manner she had always lived in it. She left no will, but told Mr. and Mrs. Murch, who were in to see her a few days before her death, that if Muff ever came back, she wanted him to have her little place and her old bits of furniture; also the old cat-skin muff, in which the boy had made his earliest debut there.

As there was no relative to contest her wishes, Muff came to the old brown cottage one day in August, and entered into possession without legal let or hindrance. The small garden of sweet corn, potatoes, poled beans, etc., was now ripening, and Muff was in time to enjoy these homely fruits, for he began boarding himself there.

"Muff's back at old Marcia's place," was the news that was told that evening about the Corners. "He's grown; he's quite a tall fellow. Been working at haying for Mr. Glinds. Wonder the old man dared to hire him after what had happened. They say he took the oats out of his wages. Queer that he should work for him. Now what do you suppose he will go to doing? May show us some of his Reform-School tricks. Good plan to keep an eye on him."

"A damaged reputashun may be repaired," says one of our popular humorists, "but the public will keep an eye on the place where the crack was."

Muff had abundant evidence of the truth of this humorous statement of the case. But he made no effort to curry popular favor. He simply went about his business, which, as the people found out by observation, was at the old mill. He looked up the owner, and leased the water-power of him for ten years, at thirty dollars a year; then he began to repair the old mill, and to put in gear, the most of which he made himself.

Meantime, the true version of his settlement with Mr. Glinds got abroad; Mr. Glinds told of it himself. He even offered to lend Muff money. Still, no one would trust him for anything as yet, except perhaps Mr. Murch; and altogether he must have labored under many disadvantages that fall, having no work out by the day for everything he had at the mill; and there were some persons at the Corners mean enough to twit him now and then of

the Reform School. Except Mrs. Murch, none of the people invited him to their houses.

But Muff was attending strictly to business, and on the first day of December the following notice was posted by him on the door of the Fair building and at the Post-office:

"50 Cords of White Birch Wanted.—The subscriber will pay \$6.00 per cord for the above amount of clear white birch at his mill, at Stony Brook.

HENRY NEMO."

This was deemed a good price, and the farmers who owned wood-lots immediately inquired further concerning it. Muff told them frankly that he should be obliged to ask persons drawing lumber to him to wait sixty days for their pay—till he could turn the lumber to cash. He had contracts.

So foul a stain does theft leave on a person, that even after four years not a man would draw a single cord of birch for Muff on sixty days' time!

I am wrong; there was one man who said a good word for him on all sides; Mr. Murch. People smiled.

"Let him have the lumber yourself," they said.

"Well, I will," replied Mr. Murch.

He hired two men with teams, and furnished the entire fifty cords himself from one of his forest lots. Mr. Glinds rode over too, not long after, and he offered to furnish fifty cords. Muff had at least demonstrated to this hard old man that he was honest.

Immediately, the stream on Stony Brook became a busy place. Muff hired several men and boys, and all day long there resounded the whiz of saws and other machines. It was found that the birch was for spools, such as are used at the thread factories; and soon loaded teams were on the road, drawing piles of closely-packed boxes down to the railroad, fifteen miles below.

Business-like strangers, the agents of various companies began to come to the sleepy little tavern at the Corners, and to inquire for Nemo, as if he were the only person of any consequence in the place.

Promptly at the expiration of sixty days, Mr. Murch was paid his money for the birch, three hundred dollars—

a fact he took great pleasure in reporting to his skeptical neighbors. Then the doubters rushed forward to offer birch on time; but Muff had money now, and paid cash down for a hundred cords more. The "spool-factory" was the busiest place in town; and the shrewder men began to buy up all the forest lots situated near the mill as fast as they could.

Money, even a little money, with a prospect of more, is a great modifier of public opinion. By March, Muff was as popular at the Corners as on the night of the Fair, years before, when he had exhibited the trained steers.

Nobody spoke of the "gallows mark" now; and everybody always knew he was a smart boy from the way he trained those steers. Public opinion often cuts a very amusing figure in its freakishness. The truly wise person will never be too much flattered by its favor, nor, indeed, too much depressed by its frown. Public opinion is a good thing to have on one's side; but a good, clear conscience is a better thing.

Through the summer, till low water in the brook, during August, Muff kept his spool machines running, and worked up the hundred cords of birch. He had six hands with him whom he paid off weekly.

In August and September he enlarged the old mill, added two new saws, and put in three new spool lathes; he also bought a new and more powerful water-wheel, a "turbine". This fall he advertised for three hundred cords of birch, proposing to employ ten hands, through the winter.

Mr. Murch brought up the matter of Muff's new business at the Corners, in town meeting, and urged—as it was a new industry, and one which might ultimately be of great advantage to the town—that the mill and property be exempted from taxation for five years. But this generous and just measure was defeated, and a valuation of three thousand dollars was assessed on the property. So that Muff had at least the proud satisfaction of knowing that he stood beholden to no one.

The matter of his being a minor in law, yet doing business for himself, came up, and he was forced to choose a legal guardian. Naturally, he chose Mr. Murch.

During the year which succeeded Muff's establishment in the spool busi-

The Amateur Poet's Corner

Because of the number of contributions, we do not return poems not published. Keep a copy of your poem.

The limit in length is sixteen (16) lines and poem must be original and written by an amateur. \$2.00 will be paid to the author of each one printed. Check will be mailed on or about first day of month following publication.

Send poems to Poetry Editor, *American Agriculturist*, P. O. Box 367, Ithaca, N. Y.

Late Appreciation

Time! why hast thou suddenly important come to be?

Thy days and years eternal seemed to me.

Thou didst not seem to measure thy hours unending;

But now thou markst them with a will unbending.

Time! not far back, of value thou seemed the least.

Now in thy flight is my respect for thee increased:

Then slow, now fast; dost spend thyself unevenly?

Or, growing old, have I learned to live and come to feel the need of thee?

—Olive Van Wormer,
R. 2, Scotia, N. Y.

ness, he began to feel a great desire to know who his parents really were, and, if they were living, to find them. He set inquiries on foot, and for months followed every clew; he even went so far the following autumn to employ a person of some reputed skill as a detective.

Nothing reliable was learned; but in March the next year a very singular result of his search came out. A man of not very reputable appearance, apparently forty-five or fifty years of age, came to the Corners, and with a great show of long-repressed affection, announced himself to Muff as his father.

His name was Fitzgerald, he said, and he told a curious story of the death of the boy's mother when he was but an infant, and of the way he, Mr. Fitzgerald,—being very poor at the time,—took care of the baby for a week, and was forced to put the little fellow in his mother's old muff. He then started forth, from Portland, carrying the child in his arms, he said, to get it to a home in some family. On this trip, he stopped at the Fair, and according to his own story, became intoxicated there. In this condition he wandered about, and as he now supposed, left the infant on the "Ransom girls" doorstep—for he never could find it after that night.

It was easy to believe the "intoxicated" part of his story; for he soon gave evidence of his unfortunate propensity at the Corners.

Mr. Murch and most other people believed the man an imposter who had somehow got possession of Muff's story, and was using it for his own benefit. Muff himself was in doubt; he was not looking for anything uncommon in the way of ancestry; and he filially desired to give the man the advantage of any doubt in the case. He hired his board at the tavern, and treated him with respect, from March till into July of that year.

By that time the self-styled "father's" conduct became such that forbearance ceased to be helpful. Muff paid his legal fines (for various breaches of the peace), and at length one morning, took him down to the railway station, and, having spoken sorrowfully but firmly, presented him with a mileage ticket, good for a thousand miles, and the sum of a hundred dollars, bidding him depart and never return. The man went off in high spirits.

But this ludicrous yet pitiable episode was not the sole result of the

The Song of the Lazy Farmer

OF ALL the blessings you can find that Nature hands out to mankind, there's nothing like a summer rain; the patter on the windowpane is evidence that all is well, we needn't worry for a spell about our crops a-dryin' out, or that a drouth will put to rout our efforts to produce a crop. There's faith and hope in ev'ry drop, a blessing on our season's toil, a benediction on the soil. The plants perk up, a brighter green across the fields is to be seen, the dust is washed from off each leaf and they point upward in relief, the roots lap up the moisture so that you can almost see 'em grow.

The hired man, upon the hay, is sleepin' thru the rainy day, a-restin' up so when it quits he'll give the morning glories fits. My head is nod-din', and mayhap I'll stretch out for a good long nap, there ain't no rest that's half as good as snoozin' off and sawin' wood while raindrops patter on

the pane, you wake and then snooze off again, your soul is full of joy and peace, you wish the rain would never cease. A growin' smell is in the air and if you ever had a care or trouble it evaporates, you have a feeling that the fates are kind to you, and ev'rything is just all right, you feel, by jing, that this old world it quite all right; the foreigners can rave and fight, but out here ev'rything's serene, when raindrops fall and crops are green!

young man's search for his parents. Not more than four months afterwards, a woman made her appearance at Muff's cottage, and declared herself—with suitable demonstrations—to be *his mother!* At sight of the old cat-skin muff, she wept with loud accompaniments, hugging it to her bosom. She had been unfortunate, she said, but her love for the boy had never ceased. Her name was Gallagher, she asserted, and she told a fine story.

Considerable doubt arose as to her entire sanity; and she soon showed herself a very cunning, sly person; nevertheless, Muff hired Mrs. Murch to board her for over two months, till he could privately look up his self-styled "mother's" stories of herself. These proved to be falsehoods. Meantime Mrs. Gallagher had become very much dissatisfied because Muff did not, as yet, consent to establish her in his cottage as housekeeper; and one morning she was found to be missing. Immediately Mrs. Murch discovered that money and valuables to the amount of a hundred and fifty dollars were also missing from her house.

Muff settled for these losses; he made no effort to have the woman apprehended; she was allowed to escape.

Such revelations of depravity seem, at first view, quite enough to shake one's faith in the human race; yet after all we must remember that only a few persons out of millions would be so base as were these wretches.

This last episode made Muff more prudent. Truly, such an effort is attended with some risk. In a case where parents are so heartless as to desert a baby on the street, it is very doubtful whether they deserve to be looked up by their offspring later in life. In conversation with the writer shortly afterward, Muff remarked, with a certain dry gravity peculiar to him, that he had paid out, in all, about a thousand dollars for the privilege of *being an orphan again.*

CHAPTER VII.

SINCE the time of the events mentioned in the last chapter, Muff has prospered wonderfully. People say he has been "lucky in everything," but there is something more than luck in his prosperity. His success is undoubtedly due to his new character, and I wish to give the boys who read this biography a few points as to what that character is. It will be worth their while to see what qualities actually do succeed best in life.

I hope, too, that no reader will feel disappointed that in following the facts of Muff's life, I have no wonderful adventures to record. He did not go West to fight the Indians or slaughter grizzly bears, but remained at the Corners and attended steadily to business. He has had no hand-to-hand conflicts with burglars, and, so far as I know, has never saved any beautiful young lady from a watery grave—though he would no doubt be quite ready to do so promptly and effectually if one should come along and tumble into his mill-pond.

I believe, however, that there was a man who tried to rob him one night, while alone at his little office in the spool factory; but there was no blood shed. Muff had the man traced and arrested next day, and said so little about it that only four or five persons learned anything of it for nearly a month.

The points to which I wish to call particular attention are those which are the basis of his success in business. For in this country today a young man must first make a success in some kind of business, trade, or profession. He must not expect to have leisure or to "play" much till he has first achieved success, and, to speak plainly, accumulated money. This is a prosaic view, and one which many youths are loath to take, but it is the truth nevertheless. Work first; then play. He who plays at the outset will probably find

himself scrubbing his way when wiser young men have secured a competence, and are enjoying a well-earned leisure.

Incidents, trivial in themselves, often lead to important discoveries when observed by a thoughtful and ingenious person. Such incidents are occurring every day, but persons acute enough to appropriate them are rare. What might be termed a mere accident led Muff to the discovery of a new process of making paper pulp from poplar wood.

It occurred in the following curious manner. A fly-wheel was needed on a new shaft in the spool factory, and until an iron one could be purchased, he hung an old mill-stone on the shaft. As this revolved, a log of green wood one day accidentally fell against it, in a peculiar way, and before it was discovered, the rough edges of the burr-stone had ground several quarts of fine slivers off the fresh wood.

On examining it, Muff was much struck by the appearance of this new kind of sawdust. He got blocks of different kinds of wood—maple, ash and poplar—and ground them in a similar way to test the kind of fibre. Poplar, he found, was reduced the most readily.

His mind having begun to run on the subject, he applied the wood-meal, as he called it, to various uses, but found it of not much value, till one day he happened to think that it might do to manufacture paper from. A quantity was made into a kind of paste, which was dried in a large sheet like paste-board. Two of these sheets were then sent to a paper mill in the state with the request that the stuff should be made into paper as an experiment.

(To be Continued)

CHARLES M. GARDNER

*Editor of the National Grange
Monthly and High Priest of De-
meter of the National Grange.*

THE GRANGES of New England are looking forward to a big day Saturday, August 5, when a summer field meeting and rally will be held at the New England Grange Building on the Eastern States Exposition grounds at West Springfield, Mass., with National Master Louis J. Taber the honor guest and speaker. A fine program of sports and entertainment features will be carried out and it is expected that large delegations will come from all the New England states, as well as many from New York. The occasion will be made a "rededication" of the Grange headquarters building, due to the fact that so many were unable to reach the formal dedication exercises on September 21st last—New Eng-

"Sonny — you've been in my bananas again!"

Pathways

By Roberta Symmes.

I love a little pathway
That hastens from the gate,
As though it was so eager
It simply couldn't wait.

A careless little pathway
That hurries to the door,
As though the feet that tread it
Have followed it before.

A shabby little pathway,
Worn hard by neighbor feet,
That beats a trail to happiness,
To welcome warm and sweet.

It may be just a little rut
With grasses overgrown,
But that's the kind of pathway
I'd like best for my own.

land's "hurricane day." The program arranged for August 5 will therefore be of appropriate character, and an opportunity will be provided for all to inspect the beautiful building which New England Granges have been successful in erecting on the Exposition grounds.

AT THE ANNIVERSARY meeting of Oak Hill Grange in Attleboro, Mass., one of the speakers was a member who had just passed the 90-year milestone of his life. His remarks were clear-cut and timely, and he surprised all his hearers at the close of his address by rendering impressively two beautiful poems by Whittier.

ONE OF THE best known Grange leaders in New England has been removed by death in the passing of George R. Drake of Manchester, New Hampshire, who for more than 30 years served the New Hampshire State Grange as secretary, was active in every line of Granite State Grange work and had been a welcome visitor at nearly every subordinate in New Hampshire. Mr. Drake had passed the 90th milestone in life, but had retained mental and physical vigor to a remarkable degree.

MOUSAM LAKE Grange, No. 467, at Shapleigh, Maine, has just completed extensive improvements on its hall, which gives it one of the most thoroughly modern Grange homes in York county.

AMONG THE MOST successful Student Granges of the land must be listed that at the Rhode Island State College at Kingston, which is having an unusually prosperous year and which recently staged a state-wide rally night, which brought together more than 400 Rhode Island Patrons, representing every county in the state. Both master and lecturer of this Grange for 1939 are faculty members at the college, and one of the strongest

backers of the Grange is the college president, Dr. R. G. Bressler. On the occasion above-mentioned, President Bressler gave the address of welcome to the assembled Patrons and paid high tribute to Grange values.

WEBSTER GRANGE, just outside of Rochester, New York, which has the distinction of being the largest subordinate Grange in the world—with a present membership exceeding 1,000—has just dedicated a sizable addition to its three-story hall, to be used exclusively for the Juvenile branch of its work. The latter comprises a large group of lusty Grange youngsters and easily ranks as one of the most active Juvenile Granges in the Empire State. Few Grange properties in the country exceed in money value or in complete equipment the enlarged Webster hall.

FOLLOWING the remarkable success of last year's Farm Products Show run in connection with the annual session of the New Hampshire State Grange, decision has been reached to stage a similar event at Manchester when the State Grange holds its session there next December. It will be planned on a more elaborate scale than last year and will be a comprehensive showing of the varied agricultural products of the Granite State.

AN UNUSUAL meeting just held in New Jersey was a "legislative reception," conducted by Morris Grange, No. 105, with many members and former members of the state legislative body invited. State Master David H. Agans—himself a former state senator—was the honor guest of the evening. An elaborate banquet was followed by a stirring speaking program, and the evening's discussion embraced many of the present problems in New Jersey civic affairs.

RHODE ISLAND Grange members are delighted at the honor recently paid to their State Grange chaplain, Rev. Elden G. Bucklin of Chepachet, one of the most popular of New England Grange speakers. At the 114th annual meeting of the Rhode Island State Baptist Convention, Mr. Bucklin was awarded an honor certificate "for distinguished service to the country churches." It was presented by the president of the convention and hearty congratulations were showered upon Mr. Bucklin because of this deserved recognition that has come to him.

ON WEDNESDAY, July 5, at 8:30 P. M., over all the radio stations of the Colonial network, covering New England and adjacent territory, a 30-minute Grange broadcast will be put on, stressing the Grange position on American citizenship as viewed from various angles. Three prominent Grange leaders constitute the scheduled speakers: Hon. Angier L. Goodwin, member of the Massachusetts State Senate; Rev. Charles A. Downs, Chaplain of the Connecticut State Grange; and Prof. William R. Gordon, extension rural sociologist at the Rhode Island State College.

BY THE WILL of the late Dr. George N. Twitchell of Auburn, Maine, a considerable legacy is left to the Educational Aid Fund conducted by the Maine State Grange for the purpose of aiding young people, by low-interest loans, to get a higher education than the public schools afford. Dr. Twitchell will be remembered as a lecturer and writer of wide renown on agricultural and rural topics, and few men have rendered greater service to agriculture and the welfare of the farm home than Dr. Twitchell. It is significant that one as interested as he was in rural youth should express that interest in his final bequest.

Kernels, Screenings and Chaff

By H. E. BABCOCK.

CERTAIN significant "straws in the wind" are showing up which indicate that the Federal government is at least considering seriously dropping some of its attempts at acreage control through Soil Conservation payments.

In states like New York and New Jersey, farmers pretty generally have resisted indirect attempts at acreage control by the government in connection with Soil Conservation payments, both as a matter of principle and because they have not wished to upset their general farm economy.

As a result, a disproportionately small amount of the enormous sums appropriated by Congress to be paid to farmers who follow Soil Conservation practices has come into such states. Regardless of whether one approves of government subsidies of agriculture or not, *no one can deny that when subsidies are paid they should be distributed equitably.*

Much credit must be given to the state college authorities in states like New York and New Jersey for changing the ideas of the Federal authorities. There is also an indication that Federal authorities, from Secretary Wallace down, are learning and are becoming more tolerant and practical in their viewpoints. *For this they are to be commended.* It takes a comparatively big man to admit he has been wrong and change his mind.

* * *

Charlie on Silage

One of the most faithful employees at SunnYGables during the last few years has been Charlie Cummings. Charlie never had much schooling but he likes to write. The other day he handed me three pages of notes on grass silage-making. There was so much good sense in them that I am reproducing a few paragraphs of his contribution. Said Charlie:

"I have worked for Mr. H. E. Babcock for the past four years and have taken over the silage-making each year. I don't remember for sure whether it has been two years or three years that we have used the phosphoric acid, but if I say two years I won't be exaggerating too much.

Getting Ready for Operation

"First of all, you dig a pit in the ground deep enough to sink your hind cutter wheels all but about six or eight inches. This much of wheels stays above the ground. Remove front wheels, then dig down until the cutter is perfectly level, then place dirt loose around the cutter so as cutter can't jump around—in other words, will stay in a firm position.

"The simple reason we set the cutter in the trench is to get away from the high lifting and heavy toiling. By doing this you only have about six inches to lift your green crops from the ground to the cutter.

"With this method of silo filling we use a gravity dump truck; stop just long enough to trip the load, then drive away. By doing so it only takes four men to operate—one man loads and

drives the truck, which is Henry Heslop, manager of SunnYGables Farm. Jake Emmick and Martin Sine feed the cutter, while I stay in the silo and tread the silage.

Treading Important

"From experience I have learned that you can't tread silage any too much. I tread the center of the silo once to the outer side twice. The reason for treading the edge more than the center is air can get to the sides and around the doors especially, but the center it can't, for the center of the silo is so compact that there is no chance of any air getting there at all.

"Green silage does not require much water because there is plenty of moisture in the plant. It is important not to let it dry out, however, between runs. Wet silage until you can hear it squeeze under your feet, then stop there, for you have enough moisture in the silage to keep it nicely.

How Silage Tastes When Prepared in the Right Method

"The actual taste for phosphoric silage is like a salad with French dressing spread over the top and the acid gives it that flavor. But the phosphoric acid is not harmful for the simple reason that about twenty-four hours after the silage is put in the silo the acid disappears.

"Molasses silage is also a very good silage. Plenty of treading and water enough to keep moisture is what keeps the silage, especially around the sides and doors."

* * *

Mustard Control

Last winter I went out on a limb and said that I was going to do something constructive about controlling mustard. Well, by using two methods of killing the plants we have secured practically one hundred per cent control of mustard on a fifteen acre field of spring barley, portions of which would be simply a mat of mustard plants today if we had not done something about preventing their development.

When we have had some disinterested and scientific checkups on what we have done I will report further on what we have learned about keeping mustard in check. Meanwhile, the following paragraph from a letter written me on June 8 by Professor H. H. Whetzel concerning mustard seed which goes through a silo, may be of interest to some, particularly to those of you who are trying to keep down the spread of mustard on your farms by putting crops badly infested with mustard into silos. Professor Whetzel says:

"I owe you an apology for not having reported to you before I left for the Venezuela trip, on the mustard seed from the silo which you sent up to me to have germinated. The gardener planted the seed immediately when I received them. They all failed to grow. Of course, as you will remember, there were not very many of them so that one could not be sure that all mustard seed is killed in passing through a silo. If you will pick out another bunch of it this fall or winter I shall be glad to run another test."

At Larchmont, Howard and Ross are making a two-man job of filling a silo with grass silage. The boys are cutting a stand of timothy in preparation for plowing the field. Howard cuts a few swaths with a mule-drawn mower with windrower attached; then, Ross (above) takes tractor, trailer, and hay loader and loads and draws the green hay. The fork shown in the picture is used to pull the pile of green hay over if the loader doesn't do the job.

When Ross arrives at the barn (above) he pauses a moment while Howard trips the gravity dumping trailer. Howard, meanwhile, has tied his mules to the fence and is ready to start feeding the ensilage cutter.

As soon as the trailer is tripped, it dumps, and Ross has merely to drive the tractor forward to pull the trailer out from under the hay. The load is left on the ground in the same shape it was on the trailer.

Once the load is dumped, Ross drives back to the field for another, while Howard tackles the husky job of feeding the green timothy into the hay chopper. When all the hay that was mowed in advance—usually several loads, depending on the weather—is picked up, Ross will go into the silo and level off and tread the silage, while Howard will take the mules and cut some more.

Working together as outlined above, two men can put in a surprising tonnage of green hay in a day. Trailer loads average a little short of a ton. The trailer box is 8' x 12'. In gauging the size of the load, remember THE HAY IS GREEN.

Protective SERVICE BUREAU

MEMBER
AMERICAN
AGRICULTURIST
PROTECTIVE SERVICE

Conducted by H. L. COSLINE

Believed Agent's Promise

"I have been a reader of your paper most of my life but have never had reason to write to the Service Bureau before. In fact, if I'm very busy, I am apt to skip that page. Now I wish I had read it more carefully.

"About a month ago our son, living at home, received a card asking if he would like a government job, and telling him to send in his name. This week a man came to see him, saying that since he had received his application he had investigated him and he was here to tell him what he had to do to get the job. He told him that there were three kinds of jobs that he could qualify for. One was Postal Clerk and I'm not just sure what the others were. He talked with my son telling him that the Government was retiring middle aged men and that there were a certain number of jobs to be filled now, and so the Institute he was connected with was preparing men to take Civil Service examinations. When they passed the examinations they would be sure of a job at \$26 per week to start with. He also told us that in our district he could take just 41 men, that he already had 28 and when he had the 41 signed up no more names would be accepted.

"My son has been very anxious to get a steady job so wanted to do it. The man instructed me in making the check out to the school, which I did. Later, though, a young woman in town said she had given her check for \$30. to her brother and later decided that the man was a fraud so went to the bank to stop payment, but the man had cashed it. They told her at the bank that the man was not connected with the Government so could insure no one of a job."

Our subscriber may well wish that she had read our Service Bureau columns regularly. We have repeatedly stated that no correspondence school can guarantee anyone a job. We have pointed out other possibilities to consider before taking a correspondence course. On the face of it, the contract is enforceable by legal action but we doubt very much if any correspondence school will want to go into court and hear this story repeated. It is only fair to say that the school in question has a good reputation but does not assume any responsibility for statements made by agents.

Business Opportunities

Be unusually cautious of the man who advertises under "Business Opportunities." One such scheme works this way:

A promoter advertising in classified columns represents to prospects that he seeks branch managers to superin-

tend salesmen. The prospect is requested to provide a bond of several hundred dollars. The letters he sends are cleverly persuasive, but a close analysis shows that the prospect is actually purchasing a quantity of the goods the promoter has for sale which, if he cannot sell, he has on his hands. The money which is referred to as a bond is not returnable, and the return of the goods shipped to him will not be accepted.

One subscriber was on the point of signing such an agreement but decided to write the Service Bureau first. Needless to say, our reply caused him to change his mind.

Guarantees

A guarantee is no better or no worse than the individual or firm that makes it. A good many firms will go to almost any lengths to satisfy a customer; others will do little or nothing. It is important to remember, even in the case of reputable concerns, that a guarantee usually covers defects in quality of materials or workmanship, and does not cover the purchaser's being absolutely satisfied. In other words, the company may send a trouble man once, twice, or several times to see what is wrong, but if the purchaser remains dissatisfied, they are likely to say, "Show us what is defective, either in material or workmanship, and we will replace it, but we will not accept the return of the goods and refund your money."

It is important to keep that in mind when buying. It may persuade you to buy from firms that have been in business long enough to establish reputations even though the price they charge may be a bit higher. When you buy on price, and say, "How can I lose? It is guaranteed," you may find that you own a machine or a tool that does not satisfy you.

Magazines

Too many subscribers report that they have given money to agents for magazines and then have never received them. There are several reasons for this. One is that an occasional crook secures in some way a supply of receipts and never intends to turn in the orders. (You need have no fear in dealing with any man who has the credentials of an American Agriculturist field man. He is bonded, and if you don't get your A.A., write us and it will be taken care of.)

Where an agent is representing a number of publications, never pay him more than the amount called for on the receipt. Commonly such agents represent what is called a two-pay subscription agency. You pay him the amount called for on the receipt, which is his commission, and you then send an additional sum to the home office before you actually get the publications. The agent who is crooked may persuade you to pay him the full amount to save yourself the inconvenience of mailing the additional sum, but he may not turn in that money to the office and you do not get your papers. Neither is it entirely safe to subscribe for publications not mentioned on the receipt. That means that the subscription agency has no agreement with the publishers of such publications, and while the agent may turn in the money and you may get your publications, there is too much chance for dissatisfaction.

A common appeal of such agents is that they are earning money to go through college. They may or may not be doing this. Some of them give the impression that they have never been in college and never will.

5 DEAD IN AUTO CRASH

Cherry Valley women victims of head-on collision near Duanesburg, N. Y. One carried the North American Travel Policy.

Mrs. JOHANNA WILLSEY was instantly killed on October 18 when the car (picture above) in which she was riding with four other women, collided with another car. Her death was due to a fractured skull and other injuries. Three of the women who were in the car were killed instantly and the other two died as a result of this accident.

OTSEGO COUNTY NATIONAL BANK
CHARTER NUMBER 13740
CHERRY VALLEY, N.Y.

Mr. E. C. Weatherby
North American Accident Insurance Co.
Ithaca, New York

March 4, 1939

Dear Mr. Weatherby:

Please accept the most sincere thanks of my children and myself for the assistance given me in presenting our claim for insurance.

Mrs. Willsey was returning from Albany to Cherry Valley with four other women friends from a day's shopping when their car had a head-on collision with a car from Schenectady.

All five of the women were almost instantly killed and one of the occupants of the other car died later from his injuries.

Your very inexpensive insurance certainly proved of the greatest value to us.

It seems to me that every person who ever rides in an automobile can ill afford to be without the protection given by the North American Accident Insurance Company for such a nominal sum of money.

I also wish to say a word of appreciation for the kindly help given me by your local agent, Mr. Delano Woodworth.

You have my permission to use any part or all of this letter for publication.

Yours very truly
Harry H. Willsey

THE BLUMER BOYS ARE MAKING GOOD IN THE POULTRY BUSINESS

The Blumer Family—Jacob, Hans, and Fred—good poultrymen and consistent G.L.F. feeders since 1923.

IN 1923 Fred Blumer took a vacation from his farm at Moscow, Pa., to tour through southern Jersey. He returned with a new enthusiasm. "Boys," he announced to sons Jacob and Hans, "we're going into the chicken business."

Mr. Blumer and his boys started conservatively with 500 Leghorn chicks purchased from Pennsylvania State College. Each year they gradually enlarged their operation until in 1930 they moved to a neighboring farm and adopted White Rocks as their principal stock.

Fred Blumer turned the business over to the boys that year. With an egg and poultry meat route established in nearby Scranton, the boys undertook the production of hatching eggs and the sale of baby chicks. The business has grown until this year they are caring for 3,000 laying hens and raising 3,000 pullets. They hatched 35,000 chicks and brooded 10,000 of them. In addition they raise 250 Narragansett and White Holland turkeys for the holiday market.

Plenty of Range for Pullets

Chicks are allowed to run out of the brooder houses as soon as weather permits. At the age of 10 to 12 weeks pullets are moved to a grassy range. At present, two large ranges are alternated each year. Spots that are worn and bare are seeded down to clover.

Cockerels are not sold until they weigh 5 pounds; they sometimes reach this weight at 12 weeks. Pullets are sometimes laying as much as 30 per cent at 5½ to 6 months of age before they are moved into the laying houses.

All the young pullets are trapnested as soon as they go into the laying houses. Birds that lay small eggs and eggs with poor shells are immediately culled out. Their first laying year, the birds furnish market eggs. No eggs are hatched except from two and three-year-old birds that have shown good production records during their first year of laying. Lights are used in the winter to give the birds a 12-hour working day.

Feeding Program

With some modesty regarding the efficiency of the Blumer management, Jake Blumer says, "We think feeding and breeding are important in building profitable birds." Every year since 1923 the Blumer boys have fed G.L.F. mashes and grains to their stock. Mr. Blumer remembers the early efforts to establish a cooperative feed service. He himself helped sell the original issue of G.L.F. stock in his vicinity.

"We have tried other poultry feeds out of curiosity," says Hans, "but we always get good results from G.L.F. and never found any better feed for the money."

Starting & Growing Mash is fed until the chicks are ready for the laying houses. "We like to grow these birds slowly," explains Jake, "so we give them more grain than most folks. At 8 weeks they are getting half grain and half mash. On the range they receive two-thirds grain and one-third mash. Once a day a wet mash is made with buttermilk."

Super Laying & Breeding Mash is fed to all layers, whether they are producing market or hatching eggs. Results in laying house No. 2 are typical. On July 19 last year 215 White Rocks were put in this house and on that day laid 61 eggs. By the end of the month they were producing 146 eggs. The next month production reached 74 per cent.

Constant culling has been practiced and the laying average has been as high as 75 per cent, never below 60 per cent except during a cold snap which occurred in February. For May there were 170 birds left in this house producing at the rate of 73 per cent.

After a moult this September, these birds will go into their second year producing hatching eggs.

Things are running smoothly at the Blumer farm. Mr. Blumer and the boys each have definite responsibilities. Watching his sons making a successful business of poultry, "Pa" Blumer says he sometimes wishes he had thought about the poultry business when he was a young man.

**TOO SHORT
TO GET A
GOOD BITE**
No Cow Can Graze
100 Pounds a Day
on This Pasture

The Blumers give their pullets plenty of grassy range, which is shifted every year. Starting & Growing Mash is fed right up to laying age. Range houses are an adaptation of the Cornell shelter shown on this page May 27. The newer ones have steel roofs.

A 1200-POUND COW giving 30 to 35 pounds of 3½ per cent milk needs close to 20 pounds of digestible feed per day. 100 pounds of grasses and clover will supply that much digestible feed—but even on the very best pasture it's nearly impossible for a cow to graze 100 pounds a day.

Too much pasture this year is like that shown in the picture — not long enough to get a good bite. Unless a cow can graze her fill in two or three hours and then lie down and make milk, she needs additional feed.

With better milk prices in sight, it is worth while to feed good cows well, to keep them in flesh, maintain their condition and milk flow. But it is a shame to buy feed for cows that can scarcely pay their way. Fortunately, beef prices are still good, so culling is not the sacrifice it sometimes is.

For producers who are fortunate

enough to enjoy a good milk market, the regular G.L.F. approved flexible formula feeds are unquestionably the best buy. But dairymen who have a poor market and still want to maintain their cows will find a feed to fit their needs in the G.L.F. line. Exchange Dairy costs \$3.00 a ton less than Super Exchange, and 18% Cow Feed is \$5.00 less than Exchange.

The Cow Feeds are mixed and priced on the same basis as the regular G.L.F. feeds. The difference in price is due entirely to the difference in ingredients. They are slightly lower in fat and in total digestible nutrients, but they are very economical per 100 pounds of T.D.N. Formulas are on the tag.

G.L.F. Service Agencies can supply 18%, 20%, or 24% Cow Feed, as well as 20% Summer Dairy, a dry feed for farmers who prefer not to feed molasses in warm weather.

"Swim THE DEEP RIVER"

Commencement Address to the Class of 1939 • •

By EDMUND EZRA DAY,
PRESIDENT OF CORNELL UNIVERSITY.

THE PRESENT state of our nation is an intriguing subject of discourse, and commencement addresses this season are dealing at length with many phases of the subject. This morning, however, my own thoughts are running in a somewhat different direction. This is not because I wish to avoid the introduction of anything unpleasant. As a matter of fact, despite the current confusion and perplexities of society, the outlook for you young people does not seem to me forbidding. I am not disposed to commiserate with the oncoming generation. After all you have life before you, and life, taken wisely, remains a great privilege. No, my reason for not speaking on this occasion about the social situation is not that I find the subject unpleasant or uninteresting or hackneyed, but that I wish to refer to certain other matters which even more directly concern your own individual lives.

May I first note that there is a crying need these days for good old-fashioned fortitude. The present is no time for the timorous. Courage has gone to a premium. Not so much courage to take bodily risks or to withstand physical suffering as courage to push on when difficulties seem insurmountable and goals unattainable. Worth-while living always has required courage of this sort. The more intelligent and responsible we become, the more does daily courage become indispensable. Life is a never-ending struggle between doubt and decision, between fear and faith. The maintenance of morale is our basic individual problem. Nations have come to see clearly enough that in any crucial undertaking, such as the conduct of war, if morale goes, all is lost. The same holds for the individual—for each one of us. Without spirit and hope, without confidence and zest, life sinks to a level that yields no lasting satisfaction. Faith in the significance of human aspiration and experience, and courage to see this faith into sustained action, these are at the same time an essential of social progress and of individual achievement. This is tantamount to saying that life without religion is impossible; just as aspiration without faith is impossible. Do not let the years bring you disillusionment. Your hopes and ambitions of this very moment may lie nearer truth and reality than will in your lifetime ever become evident. Keep on facing experience valiantly. In the words of Dr. Sizoo's eloquent message of yesterday, "Do not be content to wade the shallow wa-

This unusual picture shows over 1,000 of the young men and women of the Class of 1939 at Cornell University, with their fathers and mothers and friends, in prayer at the Commencement exercises. Trustees and faculty are on the stage. My prayer for all young people is that they may continue to keep their youthful ideals all their lives.—E. R. E.

Edmund Ezra Day, President of Cornell University (in circle).

ters, swim the deep river." The times require men and women of enduring courage. May you members of the Class of 1939 day by day, and in whatever paths you may follow, display that fortitude and strength of spirit which will make your lives worth living.

Next may I urge you to live your lives

without malice. We move in a period of appalling ill-will. Nation against nation, class against class, race against race, group against group view each other with suspicion and distrust, when not with open hostility. The arts of modern propaganda fan the flames of bitterness, and efforts to pro- (Turn to Page 21)

Firestone

GROUND GRIP TIRES

**THE ONLY TIRES MADE WITH
TRIPLE-BRACED TRACTION BARS**

**FIRST
IN SALES**

The biggest selling tractor tire in America — in fact ever since Firestone pioneered and developed the first practical pneumatic tractor tire and put the farm on rubber, Firestone Ground Grip Tires have been the first choice of farmers everywhere.

**FIRST
IN PERFORMANCE**

Firestone Ground Grip Tires provide greater traction and draw-bar pull and positive cleaning action. The continuous tread design makes Firestone Ground Grip Tires the most comfortable, easiest riding traction tires ever built.

**FIRST
IN VALUES**

Only Firestone Ground Grip Tires provide Triple-braced traction bars — 52 to 89 extra inches of traction bar length — 32% greater tread bar surface contact—21% flatter tread—Gum-Dipped cord body—extra layers Gum-Dipped cords under tread.

**FIRST
IN ECONOMY**

Firestone Ground Grip Tires save 25% in time and up to 33 1/3% in fuel over steel-lug wheels. The Firestone Tire Changeover Plan enables you to replace steel-lug wheels with Firestone Ground Grip Tires at low prices. Extra performance at no extra cost.

Call on your nearby Implement Dealer, Firestone Tire Dealer or Firestone Auto Supply and Service Store and find out how little it costs to put YOUR farm on rubber

See Firestone Tires made in the Firestone Factory and Exhibition Building at New York World's Fair. Also visit the Firestone Exhibit at the Golden Gate International Exposition at San Francisco.

CHARLES M. GARDNER

Editor of the National Grange
Monthly and High Priest of De-
meter of the National Grange.

GRANGE members from Northeastern states are planning a trip to the World's Fair at New York on Saturday, August 12, which has been designated as Grange Day at the fair. Leading officials of the organization will be on the speaking program, which will be made very attractive. Within 250 miles of New York City is a Grange membership of at least a quarter of a million, consequently they can easily reach the big show. Officials of the fair will greet the Grange members and special inducements will be offered to bring the latter inside the gates in large numbers on August 12.

* * *

FEW TOWNSHIPS in the United States can boast of five distinct subordinate Granges within their borders, but this is actually true of Haverhill, New Hampshire. For a long time there have been four Granges in Haverhill, but a new one has just been added, with 47 members on its roll. Haverhill is not a large town geographically, but has several villages, each of which readily supports its own subordinate Grange.

* * *

AT THE FINALS in the state-wide dramatic contest in Rhode Island a tremendous crowd was brought together and enthusiasm ran high. Roger Williams Grange, just outside the city of Providence, won first honors; second went to Ashaway Grange in the southern part of the state; and third to Norwood, another suburban Grange in the Providence district.

* * *

IN THE QUINEBAUG Pomona jurisdiction in eastern Connecticut much enthusiasm has followed the organization of a large choral group, which proposes to furnish timely musical features for Grange meetings and civic occasions in that section of the state. The group is putting in lots of time on rehearsals and has selected Charles H. Caswell of Willimantic as director.

* * *

MEMBERS of Niagara County Pomona in New York State are saddened by the death of their master, Howard Dewitt Aikin, who was a loyal and whole-hearted Patron. He had been master of Pendleton Grange, No. 1307, four years, had filled many positions in Niagara County Pomona and became its master in 1939. Mr. Aikin was also president of the Niagara-Orleans Dairy Herd Improvement Association and was very active in church as well as in Grange affairs.

* * *

MICKELTON GRANGE, No. 111, in Gloucester County, New Jersey, joined in an Old Home Week celebration, into whose exercises all the subordinate Granges of that vicinity heartily entered and with State Lecturer Howard B. Hancock the principal speaker. The presentation of four Golden Sheaf certificates to 50-year Grange members and 28 Silver Star certificates to 25-year members was one of the enjoyable features of the celebration.

* * *

IN WASHINGTON County, Maine, lives a Grange lady, a member of Mushquash Grange at Topsfield, who has a record of office holding in the Grange that will be hard to beat. She became a charter member of Mushquash subordinate when she was 21 years old and now at the age of 54 she points to her record of having held office in the local organization every one of the 33 years since. Not only that, but she has very rarely missed filling her station all that time. Her name is Lula B. Thornton and she has

(Continued on Page 21)

MILK DRIVERS Threaten STRIKE!

A LABOR UNION representing more than 20,000 milk drivers, delivering over 90 per cent of the milk in the metropolitan milk district, has served notice on the milk distributors that new demands of the drivers must be met or a strike will follow immediately.

The union is a part of the International Brotherhood of Teamsters, which is affiliated with the American Federation of Labor.

Demands include large wage increases, a 40-hour 5-day week, and 15 legal holidays a year. There are many minor demands totaling more than 50 separate items, every one of which the dealers state will add to the cost of milk to the consumer. The contract between the dealers and the drivers has expired and the drivers are asking for a five-year renewal to include the increased demands.

After several days negotiations, distributors announced that to grant the demands of the drivers would increase cost of milk in New York City 2 cents a quart, and that it was absolutely impossible to grant them. The dealers state that under the expiring contract time and a half is provided for overtime, all employees receive two weeks vacation with full pay, the union now has a closed shop, with the privilege of check off and arbitration of all controversies, which make far more privileges, say the dealers, than exist in many other industrial fields. Fifty-one milk distributing companies represented in the negotiations are unanimous that the wage increases demanded by the unions are utterly without economic justification. House-to-house milk drivers now average in excess of \$50 a week. These union wages are now approximately 20 per cent higher than those of non-union companies, and are well ahead of those paid in comparable industries, approximately 4 per cent higher than the big wages of 1929, although cost of living is approximately 16 per cent lower.

Controversy is still raging as we go to press.

Every farmer sympathizes with the desire of every other working man to get wages which will give him a decent standard of living. But how many farmers are making \$50 a week, or half that? To be sure, the working man in the city has to pay high rent and buy all of his food. The farmer does not have to pay rent (in cash) and he gets some of his food from his farm. The city man at \$50 a week for his labor is far better off economically than the large majority of farmers have been since 1929, and the farmer, in addition to his labor, has a heavy capital investment.

The present unreasonable demands of labor unions are one of the chief causes of our economic distress. Too high wages result in a larger use of machinery and in a greatly increasing unemployment. The worker himself loses in the end. Further than that, the unreasonable cost of labor in what the farmer and everybody else buys has slowed down all business.

* * *

Bordens and Sheffields have announced an increase in the New York City retail price of 1c a quart for milk and an increase of 1c a half pint for heavy cream effective July 1. This will make the retail price of Grade B milk 13 cents and Grade A 16 cents, delivered on the doorstep, and the price of a half pint of heavy cream will be 19 cents.

Administrator Harmon has announced that the Class I and Class II-A prices for July will be respectively \$2.00 and \$1.50 per hundredweight.

Milk Problems Yet to be Solved

THE MILK marketing agreements are back, and dairymen can now look forward to rising prices for milk. But let no one get the idea that milk marketing problems are all solved. All that we can expect from the marketing agreements is that they will bring the price of milk to farmers up to the general price level. It has been far below since the marketing agreements went out. The fundamental problem, of course, not only for the milk farmer but for everyone else, is to raise the price level itself.

Also with us in the dairy business, marketing agreements or no marketing agreements, is the old surplus problem. Marketing agreements or any other marketing plan will only help temporarily if farmers begin to increase their production as soon as milk prices improve. Of course, the equalization plan is really a surplus plan, because when there is too much fluid milk the average equalization price is automatically reduced. The trouble is that the average dairyman does not realize that he suffers immediately if he produces more than his share.

What is the answer? Farmers will never take care of their own surplus as individuals, because this would take 100 per cent cooperation, which is impossible. But maybe through cooperative associations a plan can be reached to place every dairyman on a quota basis. In any case, some further surplus plan must eventually be followed. Doc. Roberts has some excellent surplus control suggestions on page 11.

Another problem to which dairymen should give much thought is the danger of leaning too heavily on the state and federal governments. These government agencies have been 100 per cent cooperative with the milk marketing agreements. Their administration has been fair and government officials are perfectly willing to correct injustices where the agreements do not work. Nevertheless, every farmer should look forward to the time when he can go forward alone, dependent upon his own cooperative association and its cooperation with all other associations. That is the only American way. Otherwise, the time will eventually come when the farmer will have little to say about either his marketing or milk production problems. Every effort should be made, therefore, to strengthen your own cooperative and to demand that it work 100 per cent with the other dairymen's cooperatives in your milk shed.

Their Big Day

IF YOU were asked to name the greatest day in your life, what would it be? If married, your answer will be your marriage day—at least I hope you would say that.

Another big day for most of us is when we graduate from high school or college.

Gathered for Commencement in the immense Drill Hall at Cornell University on June 19 were over a thousand young men and women, members of the Class of 1939. As I looked in their fresh young faces, so eagerly looking forward to life's experiences, and as I looked at the worn but happy expressions on the faces of hundreds of their fathers and mothers gathered for this great day, I hoped for them that graduation would always mean what it meant on that day, that there would be no disillusionment or impairment of their high, youthful ideals.

Then President Day of Cornell, in one of the finest Commencement addresses I have ever heard, told the Class of 1939 how to keep their

ideals bright and shining, how to make their lives all that they now promise to be.

For all of the thousands of young men and women who graduated in June from schools and colleges all over the land, and for all of their parents who worked so hard to make their education possible, we print on Page 1 President Day's message in part. Cut it out, paste it in the scrap book, write it upon your hearts, and ten, twenty-five, fifty years from now review it and see how you have measured up.

Fifty Years of Happiness

ON JULY 3, at the invitation of the Hunterdon County Pomona Grange, hundreds of friends gathered to celebrate the fiftieth anniversary of the marriage of Mr. and Mrs. David H. Agans of Three Bridges, New Jersey. That is one of the finest tributes that has ever come to my attention, fine because it was so richly deserved.

Both Mr. and Mrs. Agans have devoted their lives to the service of New Jersey farmers, in fact to farmers and citizens everywhere. In almost every move for the good of the people and of agriculture over a long lifetime, Mr. and Mrs. Agans have been active. Dave's common sense, his straight from the shoulder honesty, his high ability, and his outstanding determination to help folks, have made friends even of those who have not agreed with him. As a result his fellows have honored him with service in the State Senate as long as he would stay, have appointed or elected him on innumerable commissions, and the State Grange of New Jersey has elected and re-elected him its Master for twenty years.

I have long been a believer in the philosophy expressed by the old saying that "you cannot read your tombstone when you are dead." How right and fitting it is, then, for the Grangers and all the rest of their friends to show appreciation of Mr. and Mrs. Agan's work.

The staff and readers of *American Agriculturist* congratulate Hunterdon County Pomona Grange for holding this celebration, and we congratulate Mr. and Mrs. Agans for their long service and for achieving fifty years of happiness together. May it long continue!

Changes in Cultivating Practices

WHENEVER I see a farmer cultivating, I think of the weary miles on miles that I, as a farm boy, followed an old farm plug, cultivating the corn and potato fields. I think too of how swearing mad I used to get when the careless horse insisted on walking on the rows instead of between them. Fortunately, some of the grief has been taken out of cultivating by the modern cultivator, which enables the farmer to ride instead of walk.

Many scientists who have experimented with the problem claim that were it not for weeds it would be unnecessary to cultivate at all. Probably this is going too far, for there are certain kinds of soil that need stirring up for best results. But it is true that too much and too deep cultivating does more harm than good by injury to the root system of the plant. Anyway, cultivation has to be done in practically all cases on account of weeds, which cost the American farmer last year something like \$44,000,000.

Another big advance in farm methods is the almost complete elimination of the hand hoe. How I hate it! The very sight of one carries me

back to boyhood days when no potato field was considered properly cared for until it had been hoed by hand at least twice. That meant ten hours each day for weeks at dull, monotonous labor, with cows to milk and chores to do before and after. No wonder the boys left the farm!

"The Youth of Tomorrow"

MEETING in annual convention in New York City last week were hundreds of members of the National Council of the Boy Scouts of America, with scout officers, executives and friends. The theme of the convention was *The Youth of Tomorrow*.

As I looked over this great group and listened to the inspiring program, my confidence, optimism and hope increased for the future of America and of the world. From all over America, and from even as far as Hawaii, came men active in business and the professions who still had found time to give to boys. Over half a million men — and that is a sizable army — are devoting a part or all of their time to boy scouts. That their effort is worthwhile is shown by the fact that 1,271,000 boys are enrolled scouts, an increase of 13 per cent for 1938 over 1937. This brings the number to an all-time high. Since the movement was incorporated in 1910, 8,400,000 boys and men have enjoyed the benefits of scouting. What those benefits are doing to make boys better men and better citizens is beyond measure.

When one adds to this army of scouts the equally splendid work that is being done by other young people's organizations, such as the 4-H clubs, the Young Farmers Clubs, the Juvenile Granges, and all of the young people's church societies, he realizes that in spite of the present troubles *The Youth of Tomorrow* are marching upward toward a better day.

You don't have to live in town to be a scout. You don't even have to go to town to join, for there are scout opportunities for everyone no matter where he lives. Anyone interested should write to O. H. Benson, Boy Scouts of America, 2 Park Avenue, New York City.

Eastman's Chestnut

WHEN it comes to stealing chestnuts, there is no honor among thieves. Everybody steals mine, and I do not hesitate to steal others when they are good enough. Here is one I have heard or read at least six times, and laughed at every time:

The night-clerk of the hotel was surprised to see a battered-looking person in his shirt sleeves come staggering up to the desk and to pause there a bit groggily.

"What can I do for you?" inquired the clerk.

"I'd like", said the stranger laboriously, "to be 'scorted to that room 202 on the secon' floor."

"202"? repeated the clerk. He consulted the register. "Why, that room is occupied by Mr. Oscar J. Billups of Toledo, Ohio, and it's pretty late to be rousing a guest."

"I know that, well as you do," stated the other. "Nevertheless, and contrary notwithstanding, I desire to be shown to room 202 without any further con-ver—any further talk."

"What business have you got there?" demanded the clerk.

"Thash my business."

"Well, what's your name, then?"

"I'm Oscar J. Billups of Toledo; I jusht fell out of the window."

New York City.

Dear Ma and Pa:

I DID something pretty good the other day. I got off the subway train at Grand Central Station and came out on the street just an hour and five minutes later—which is ten minutes less than I've ever done it before. I ended up within two blocks of where I intended to, too, so I guess I'm really getting so I know my way around.

I been doing a lot of going lately. I went to the Paramount theater which is about 22 times bigger than the Hog Hollow Opera House and about 50 times fancier. When the picture was over, the front part of the stage raised up out of the cellar and on it was Benny Goodman and his band swinging it. Well I tell you I haven't heard such a hullabaloo since the Hog Hollow Hoppers beat the Rural Rompers in that basketball game. When the show was over, Mr. Goodman sunk down in the cellar again.

You're apt to see most anybody on the street here. I was walking by the Hotel Astor the other day and got quite a surprise to see Mrs. F. D. R. standing waiting for her car. She looked very tall and stately but like anybody else and I think she's a lot better looking than her pictures.

You know, even though a lot of things may need fixing in this country, it made me kind of glad and proud to see her standing there without a lot of soldiers around or bands playing or people bumping their knees on the ground or clicking their heels and sticking their arms out.

Well this is all I got time to write this time.

Your loving son,
Cephus.

* * *

Dear Ma and Pa:

I GUESS I'm a little late in writing to you this week. But this business of finding a new place to live and getting settled takes a lot of time. I finally found a place where I have 150 square feet of earth outside my window, and it actually has grass on it. You know, it's funny how important this little chunk of ground is to me now. For years I lived where I had fields and hills stretching out for miles all around me and I sort of took it all for granted.

I went down and watched that big boat, the Normandie, sail the other day. I went on board and looked around and, by gosh, it was hard to believe that it was actually afloat and would soon be crossing the ocean. I never saw anything so big and luxurious, except a big hotel. There was everything from a swimming pool to a moving picture theater.

I stood on the dock to watch her sail. People certainly get a lot of exercise out of a sailing. They start waving goodbye at the first toot of the whistle and they're packed on to the dock so tight that once they get their arms up, they can't get them down, so they might as well keep on waving.

Tell Cousin Jake I won't expect a letter from him while he's busy haying, but if you get a few days rain tell him to sit down and write me a note.

Your loving son,
Cephus.

CEPHUS in the CITY

*Being the Personal Correspondence
of a Country Boy Now Living
in the Metropolis*

Dear Uncle Zeb:

THERE'S not a lot to write about. I've been working and haven't had much time to run around lately.

You know you'd be surprised the number of hermits there are in this town. There's an awful lot of people that's never been outside a radius of a few blocks. Some don't want to move around, but most of them haven't enough money to move. I notice though that the disease germs and criminals don't stay in one neighborhood.

I took a boat ride the other day that you would have liked. I got on a ferry boat and went over to Staten Island and back. It took an hour and only cost a dime. I wasn't a bit seasick, so I guess I'm a born "gob". Coming across the bay I got a view of the New York skyline, which is like nothing nobody has ever seen before until they've seen it. We passed the Statue of Liberty. She looked like her pictures, only I thought she seemed a bit green and sickly looking. Maybe she's been reading the newspapers lately.

Has Elsie become a mother yet? I hope she has a black one with seven toes as I know Cousin Hep wants one for a pet.

Well Uncle Zeb write me a letter sometime when you have a couple of days to spare.

Your nephew,
Cephus.

* * *

Dear Aunt Emmie:

I SPENT the day in Macy's, which is just a general store grown up. I wish you could have been with me because I know you would have enjoyed yourself. I started in the basement where there looked to be about an acre of dishes. I never knew there were so many different kinds of dishes. Eating can be a pretty fancy occupation if you can afford to go in for it.

On the first floor they had everything from silk stockings to cigars. I could even have had my eyes fitted, and over on one side was a drug counter which made me wonder why they didn't call it a drug store. But what interested me

most were some bargain counters where a lot of people were having a free-for-all over some stuff they probably didn't need.

I went up to the seventh floor several times and back because I liked riding on the moving stairs. You just step onto them and they do the work. If I ever get rich, I'm going to have

some in my house.

When I got tired of riding on the stairs, I started looking through the other floors. I found everything but an automobile. I had fun on the furniture floor looking at the model rooms. It was like visiting. I liked the toys, too. They certainly got some good ones nowadays.

I certainly had a fine day there and I bought me a nice new pair of socks. When you come down, Aunt Emmie, we'll go shopping together.

Your loving nephew,
Cephus.

* * *

Dear Ma and Pa:

THIS morning I took a walk just at dawn. It's awful quiet here then. I ain't never heard a quiet just like it and never realized before how dead steel and concrete can be.

Most everybody was sleeping, including the guys with newspaper mattresses and doorsill beds. About the only person stirring on Broadway was a silk-hatted gentleman having a loud argument with himself about whether he should go home or not.

Once in a while a milkman would pass with rubber tires on his wagon, the horse making a funny plop-plop noise because he had rubber shoes on. They make it easier for the horses' feet on the pavement, but I wonder what old Sal and Pete would think if you put rubber shoes on them. I bet they'd feel like sissys.

When I got down to the Bowery, I saw a funny sight—a fellow who looked to be about your age Pa, but I'll bet he was much younger. He was eating out of a garbage pail, and he wasn't the only one I saw snitching scraps. It made me feel sort of sick and was quite a shock because I thought there was too much to eat in this country, what with crops having to be controlled and all.

It made me feel like moving to some other spot quick, so I took an elevated and got off at South Ferry and went over and sat down in Battery Park. The harbor looked pretty and peaceful with a little fog rising off from it and only a few small boats scattered around. As I sat there, a battleship went plowing out. It was very impressive looking, but it ought to be at the price they cost.

Next I meandered up where the big time gambling

is done and the country run—Wall Street. The tall buildings and narrow streets, all deserted and no sunlight, gave me a cold feeling, and the echo of the boat whistles sounded like a dog howling in a grave yard at midnight. Suddenly in the midst of all this, I came onto a little old church with a little old cemetery and the sight of it sort of took the chill off me somehow. I walked around looking at the names and funny words on the old stones, and I couldn't help but wonder if maybe these folks who lived here once weren't a lot happier than the present inhabitants; and that if they were given the chance to come back, maybe they'd jump right back after one look and pull the sod over their heads. And then maybe they wouldn't.

Time was getting on so I took a subway uptown—got mauled by a herd of humans rushing to work as the train reached Times Square and I came out into a din and a roar. The city was awake.

It doesn't make sense, but it's exciting for a while anyhow. Write me a long letter soon, Ma.

Your loving son,
Cephus.

* * *

Dear Ma and Pa:

I JUST witnessed a little excitement. They had a fire in a shop across the street which didn't do much damage but drew a lot of people and fire engines. People here are just like they are in Hog Hollow. They love to chase the fire engines too, only here they don't bother to go more than a block or two because there are so many fires that they know

if they miss one, there'll be another one soon.

Incidentally, after watching the professionals work here I decided that the boys back home are pretty darn good smoke eaters.

Well this is about all for now. Thanks for the raspberry jam you sent back in my laundry case, Ma. It was fine after I got the broken glass out of it, but the part right next to the shirt tasted funny. It was the bluin', I guess.

Your loving son,
Cephus.

* * *

Dear Ma and Pa:

WELL, I went out to the World's Fair yesterday and saw the "World of Tomorrow." It sure is some world. When I got to the Fairgrounds, I wasn't sure whether I was going to like it much or not. It was awfully big and sort of crazy looking. But after I walked around for a while I began to get the feel of it.

I saw an electrified farm that was a honey. They had machines for doing everything, except cussing the cows; and everything was so neat and clean I felt like wiping my feet before I walked into the barn. And, gosh, Ma, if you could have a house like the one they have on that farm, about all you'd have to do would be to throw a few switches to get the housework done.

Can you imagine cows riding around on a merry-go-round and being milked at the same time? Sounds silly, doesn't it? But they were doing it in one of the big milk company exhibits. The cow would get on one side of the merry-go-round and get washed, scrubbed, disinfected, and get practically

(Continued on Page 21)

GUARD GRADE and PROFIT with a McCORMICK-DEERING POTATO DIGGER

EVERY potato grower wants his crop to grade No. 1. That's a rigid standard... and a rigid test for a McCormick-Deering Potato Digger.

A few cut and bruised potatoes can cut down the grade of an otherwise top-quality crop. You don't run that risk with a new McCormick-Deering. You'll harvest clean, whole potatoes that will bring you a better price.

The McCormick-Deering dealer carries a complete line of quality-built diggers in both tractor and horse-drawn models. Three power-operated diggers are available in 1 and 2-row sizes. There are seven elevator-type horse-drawn machines in the line; also two walking diggers for farms of small acreage. Take your potato harvesting problem to the McCormick-Deering dealer. He can start you on the way to harvesting a top-grade, profitable crop.

A fixed nozzle or Skinner system provides water to this home garden when needed.

Rain Making

By PAUL WORK

on THIRSTY GROUND

VEGETABLE crops call for irrigation and often pay for it, too. In years gone by, farmers felt pretty helpless when streams were low and skies were brazen and every promising shower shied off to the North or the South. It was and is a serious matter. Each rainless day means dollar loss and the anxiety for the outcome of the season's crops mounts and intensifies almost to distraction.

To the vegetable man, the stake per acre is heavy, but by the same token he can often afford to do something about it. And when drought is widespread prices rise and the sales that are missed through burned up crops are sales at higher prices than normal. So, in seasons when irrigation is needed, price returns are likely to be particularly gratifying.

And now the rain maker is abroad in the land. Irrigation has been used for years;—yes, for centuries, but each time the salesmen come around, they bring new gadgets and new efficiencies.

Water Supply:

Many different sources of water are drawn upon in the irrigation of vegetables in the Northeast. The nearer the water level is to the irrigated area, in both vertical distance and in horizontal distance, the better. Even horizontal pumping uses up power at a rapid rate through frictions within the pipe. It takes 100 tons of water to give an acre the equivalent of one inch of rain and it is readily seen that increasing the lift greatly increases the power requirements. The Talmadge establishment has a deep well and nearly half the investment is in well and pump. Where water can be supplied by gravity and the land is fairly level, surface systems may be operated without pumping. In many cases, nearby streams or lakes are drawn upon. Where the water table is near the surface, driven wells may be used as in the practice of George Bixby at Schenectady and the Janowski Brothers at Elmira. Several pipes with perforated points may be driven into the ground and a pump may be connected to 3 or 4 of these at a time. The success of this all depends on how rapidly water can be drawn from the sub-soil. Around Rochester there are a good many shallow wells of larger diameter which serve very nicely.

Ways of Irrigating:

The simplest way to water the land is to divert a stream and let its cooling flood run down the rows to wet up the soil and refresh the thirsty plants. This is the method most commonly used

ed out West and in Texas. There are doubtless places where it could be well employed in the Northeast as well. E. C. Bradley, market gardener in the Champlain country, learned the art in his youth in Idaho and now uses it on his vegetable plots to good advantage. Surface irrigation requires fairly level land. It is somewhat wasteful of water, as some may be lost at the near end of the row while the water is making its way to the other end. Where the supply is adequate, however, it is a good and useful system.

Sub-Irrigation:

Thirty years ago, Walter Bonney at Batavia had installed tile in a considerable area of muck and he was in a position, by closing the ditches, to raise the water table underneath the roots of his crops. A little stream coming in from above furnished water for this purpose.

Much of the irrigation used in Florida employs water from artesian wells. Tiles are laid at intervals and these serve both for application of water and for drainage. The famous Stanford celery area is watered in this fashion. The system is applicable only in limited areas as it is necessary to have an impervious sub-soil. Otherwise, the waste by drainage is overwhelming.

Fixed Nozzle Irrigation:

Perhaps the most rainlike of irrigation systems is the fixed nozzle or Skinner system. This consists of pipes spaced about 50 feet apart each carrying tiny nozzles 3 feet apart on the line. These nozzles throw a slender stream to a maximum distance of about 30 feet, using pressure of about

(Continued on Page 14)

"SPEAKING OF CUCKOOS, DEAR. WHAT DO YOU HEAR FROM YOUR MOTHER THESE DAYS?" #39

NOW . . in Every Farm Home there is **HOPE**

60 short days ago there was despair in every dairy farm home in this milk shed. Federal and State help had been taken from the farmers, and milk checks were shrinking badly. Today, with that help restored, those same homes enjoy HOPE.

That hope which is in every dairy home places a great responsibility upon the dairy leaders of the milk shed. For such hopes must not be in vain.

Cooperatives must not allow themselves to be divided in the face of this opportunity to raise farmers' milk checks. Bitterness must not be allowed to come between the farmer and a living price for his milk. Dealers must not be allowed to get cooperatives against each other for the purpose of defeating the

effectiveness of the orders. Leaders must lead *for the good of all*.

When it became legal for cooperatives to work together, the Dairymen's League announced its willingness to work with other cooperatives in every constructive move. This we have done. When the Federal and State orders were in force last year all the services of the League were placed at the disposal of all cooperatives. Many leaders with whom we worked learned of the value of those services and voiced their respect for the sincerity of the League's efforts.

And today we again pledge ourselves to continue the fight we have waged for the past twenty years—a fight for better living conditions in every dairy farm home in this milk shed.

**Published by the Thousands of Farmers Who Own, Operate and
Control The Dairymen's League**

WHEN YOU'RE HUSTLING TO BEAT THE RAIN...

YOU'LL BE GLAD YOU BOUGHT
AT THE ESSO SIGN!

BAD weather doesn't give you much notice... dark clouds mean you have to *hustle*! And any time lost will cost you plenty! *That's* when your farm equipment must stand by you 100%!

That's why, for *extra* power and motor protection around the farm, you should rely on fuels and oils made and backed by the world's leading oil organization! For many years, practical farmers have been saving money by stopping at the Esso Sign for petroleum products that *last*...products that will stand up under *all* work conditions. You are pretty sure to find that patronage of your nearby Esso Dealer will cut down the expense of motorized operations on your farm. Protect your trucks, cars, tractors and other machinery... enjoy more efficient operation, too. Make it a habit to drive in at the Esso Sign! The petroleum products, tires and batteries on sale there have a *lasting* reputation!

ESSO MARKETERS

COLONIAL BEACON OIL COMPANY

Ten ewes killed by dogs in one night on the farm of the author, Lewis Allen, Macedon, N. Y. Says Mr. Allen: "The idea often reported that a goat turned with a flock will prevent dog damage is false, as is also the idea that bells on sheep will keep dogs away."

DOGS and SHEEP —A Bad Mixture

By LEWIS F. ALLEN,

sec'y, Ontario County Sheep Growers Association.

PERHAPS I may start something by discussing so delicate a subject as the damage done to domestic animals by Old Rover and his pals, but an inquiry recently in *American Agriculturist* as to whether or not damage by dogs is decreasing prompts this article.

Reasons advanced for the decline in numbers of sheep on New York farms are too numerous to mention here and probably all have a bearing on the subject. But we must look farther than the dairy cow, external and internal parasites, free wool, poor fences, and low prices to determine just why sheep numbers have decreased from 3½ million in 1860 to less than half a million in 1938. Living within a day's journey of the largest consuming center in the United States we have an abundance of good pastures, but also find importations of several hundred million pounds of wool annually, as well as large quantities of frozen lamb carcasses from even as far away as the Argentine. It surely is just too bad that something cannot be done to give the sheep grower a break.

We have but to search the records to discover that "dog damage" is about as old as the sheep growing industry. The old reliable "Randalls Practical Shepherd," well known to older sheepmen, states that in 1860 losses were 100,000 dollars per year. Daniel P. Witter in Agricultural Bulletin No. 96 is authority for the statement that in 1916 more than 6000 sheep and lambs were destroyed by dogs. Value of destroyed animals being more than 100,000 dollars. Statistics gathered by the writer from the files of the Department of Agriculture and Markets show that for the period from 1921 to 1938 the damages paid for losses to domestic animals has been in excess of

150,000 dollars per year.

Census figures show that the number of farmers engaged in raising sheep is slowly decreasing while the number of dogs is steadily increasing. For the period mentioned above, dog numbers increased from 263,882 in 1921 to 498,953 in 1938, averaging about 10,000 per year.

With all of the efforts of Sheep Grower Associations and the Extension Service of the College of Agriculture, it seems impossible materially to increase the number of sheep in New York State.

Only with the placing of the present law relative to licensing of dogs and payment of losses from license fees on the Statute books has it been possible for the grower partially to be paid for losses. The discouragement which comes from having a flock of sheep ruined by night raids of canines is so great that it is no wonder that so many give up sheep growing for other lines of endeavor.

Attempts are now being made to strengthen the protective features of the law and these efforts should receive the support of every lover of sheep. Unquestionably damage by dogs must be classed as one of the major causes of the decline in sheep husbandry.

Figures below are quoted from the Department of Agriculture and Markets for 1938 and fully demonstrate that unless something more adequate than present methods of protection are advanced, sheep growing as well as other animal industries are on the way out.

	Killed by Dogs	Injured
Sheep and lambs....	7615	3712
Cattle	252	398
Swine	221	28
Fowls	29686	918
Horses	6	5
Hares and rabbits	1223	109
Goats	114	23

"I'm not absolutely sure, Ed! I haven't seen a deer since I was a kid."

For the Handy Farm Mechanic

By I. W. DICKERSON

Crank Case Oil Harms Wagon Wheels

Running wagon wheel rims in hot linseed oil is good practice, as the oil not only dries into a tough paint-like film which keeps out water, but also partly fills up any slight looseness under the tires. Waste crankcase oil applied hot in the same way does more harm than good, since it does not dry into a tough film, but actually lubricates the tire so it will give more trouble from slipping off when working under heavy pressure.

A Tire Chair-Swing

Here is an improvement over the common type of swing made from an old automobile tire casing. The tread is mostly cut away, except for a square area which forms the seat proper and

a 2 inch strip just above the seat on the back side for the back rest. A pair of wood cleats at the top also spread the beads somewhat for greater width and wood cleats are fastened at the sides for arm rests. A square wood block is fastened to the under side of the rubber seat for reinforcement. Above it the rubber bulges slightly because it is turned wrong side out and forms a natural, soft cushion. The picture shows the completed swing.

Tightening a Loose Screw

When a screw hole gets so large that the screw will not hold properly, partly fill the hole with steel wool, and the screw will hold tight again.

Handling Hot Jars

A Home Demonstration Agent states that hot jars may easily and safely be removed from the cold pack or pressure cooker by placing a piece of inner tube over the top of the jar. The heat does not strike through nor will it slip if the rough side is put next to the jar. Another piece of the tube may be used to hold the jar while the lid is tight-

ened with the first piece. It is much more convenient than trying to use towels.

Towel Holder

A handy towel roller can be made in a few minutes as shown in the diagram (H-5) out of a piece of broom handle or old shade roller with a nail driven in each end, and two brackets from an old window shade roller.

Use Penetrating Oil

A can of penetrating oil should be on every mechanic's bench and should

be used freely on silo nuts before tightening the hoops, on rusted nuts and bolts which have to be unscrewed, on bushings or pins before removing, and in fact any part which is rusted or gummed badly. It should be applied at least an hour before the part is to be removed. Penetrating oil can be purchased from your local dealer. A fair substitute can be made of equal parts of turpentine and kerosene, with a little denatured alcohol added.

Inspect Furnace Pipes

The combination of creosote deposits and moisture is quite destructive of the ordinary galvanized furnace pipes during the summer. If such pipes have been in use two winters, better inspect them carefully and if they show specks or pits on the outside you can probably

push a pencil or a nail through them. Safety demands that such pipes be replaced before starting up the fire this fall.

Handy Insulation for Pliers

A short length of 3/8-inch rubber tubing slipped over the handles insulates any pliers so it can be used for

handling spark plugs, ignition cables, 110 or 220-volt electric wires, etc. It is much better than the usual method of wrapping with friction tape, but is not safe for handling high tension wires.

Farmers everywhere are finding this is the year to go FORD V-8

ONLY V-8 ENGINES in any low-priced car, 60 h.p. or 85 h.p. Smooth, quiet, responsive.

HIGH GAS MILEAGE. 85 h.p. Ford V-8 in this year's Gilmore-Yosemite Economy Run showed best gasoline mileage among all leading low-priced cars.

RIDE-STABILIZING CHASSIS—Only the Ford V-8 of all low-priced cars has full torque-tube drive with four radius rods. No front end bobbing or dipping.

BIGGEST HYDRAULIC BRAKES ever used on a low-priced car (162 square inches braking surface).

LONGER PASSENGER RIDEBASE than any other low-priced car; 123 inches between spring centers.

MOST ADVANCED STYLE in 1939 low-price field.

MOST EXTRA EQUIPMENT at no extra cost. Low Ford V-8 delivered prices include many items of desirable equipment.

FOR important improvements—for features that really count—Ford V-8 is the low-priced car of the year! It gives you the things you want—economy, stamina, style, plenty of room for passengers and luggage—each an

advantage of special importance to farmers who must use their cars hard. Before you decide on your new car—learn how much Ford V-8 gives you for your money! You'll agree—it's your kind of a car!

No OTHER LOW-PRICED CAR CAN MATCH IT!

By J. F. (DOC) ROBERTS

PRODUCING veal calves weighing from 150 to 200 lbs. as a profitable means of cooperating toward less milk, and therefore a better milk price, must be on a good many men's minds. I can assure you that it is not just one man's idea, because so many men have spoken to me about it, and usually so enthusiastically that they go on to say that this alone will solve the milk problem of the Northeast.

Really good veal calves bringing from 8c to 10c a pound on the farm, month after month, proves that there

them here, but can assure you that it can be and is being done with good results.

It has been most interesting, and also educational, to note the difference in the weight of calves marketed during fluctuations in the milk price. During the early part of this year when milk was bringing a more satisfactory price generally, the average weight of the calves coming to Buffalo was only slightly over 100 pounds. During the past month or six weeks, when the price of milk has been so disastrously low, the average has been almost 30 pounds more, and while this difference is more or less seasonal, the fact still remains that the calves during this recent milk-price slump have been consuming a great deal more milk than they were under a higher milk price, and again it shows that "It can be done."

Judging by the thoughts of men with whom I come in contact, we now have protection enough in the dairy industry to guarantee a satisfactory milk price, if men producing the milk will do their part, by cooperation and di-

This purebred Percheron colt is being raised on the farm of Petzold Brothers, Newark Valley, N. Y. These brothers have a fine herd of Holsteins and they are following the ideas outlined by Doc Roberts on this page. They keep a couple of brood sows, and have been using skim milk to veal calves. They are following another good sound practice by retailing as many products of the farm as they can.

is a very definite demand for choice veal as meat. Yet the average dairyman is marketing little, light calves, which in some cases are not over a day or two old, so there can be no question but that calves, as a milk-consumer, can and should have a very definite place in the milk price structure. On the other hand, it is not hard to find dairymen who object to vealing their calves, on what seem to be pretty sound facts, such as harm to the cow, her falling off in milk when the calf is taken away, etc. But to meet these objections, we also find a good many dairymen who have overcome such difficulties and are making money, producing top calves. There are so many ways and means, and so many different ideas on just how to do this, that I will not attempt to go into any of

versification, toward holding down the milk surplus. Therefore, in the last few issues of *American Agriculturist*, I have tried to show how surplus feed, which has been producing the surplus milk, can profitably be diverted into other livestock—horses, sheep and lambs, beef cattle, hogs, or veal calves, depending entirely upon the situation on different farms in different localities. Personally I feel that there is great opportunity for livestock diversification, and that the future milk price depends entirely upon the cooperation that this diversification idea gets from the producer himself.

* * *

I am hearing a good many bear stories in regard to this year's hay crop and oat crop; in fact, all feeds. From reports that I am getting, and from the things that I see, I do not believe that these should be taken too seriously. Undoubtedly, the first cutting of hay is short, but not as short as we have all seen it. Rains have been pretty fairly general, and with a normal rainfall from now on, I do not believe that we in the Northeast will have a serious shortage of any forage or grain crop. Therefore, do not rush livestock to market, fearing that there will be a big influx this fall because of a shortage of (or high-priced) feed. I quote from a letter I received from a man who has been making a survey through Indiana, Illinois, Iowa, Minnesota and Wisconsin: "It has rained steadily for almost 24 hours and the prospects at present are for another bumper crop of corn. While the first cutting of hay is short, the second should be immense, and oats are going to turn out much better than anticipated; in fact, all small grains are doing wonderfully well right now. I see corn better than knee-high, which is unusual this early in these sections."

"I'm goin' to bed, dear—do you want to go through my pants before I hang them up?"

Shell Live Stock Spray acts like Tear Gas on Insects

DAIRYMEN and other livestock breeders asked Shell for five major points in a spray. First, it must kill insects in the barns; second, it must repel them in the pasture; third, it must not irritate the stock; fourth, it must be stable; fifth, it must be economical.

That spray is ready for you now—Laboratory-tested thoroughly and during the past three years proved on thousands of farms, Shell Livestock Spray gives you every advantage you could ask:

It kills insects—doesn't merely stun them.

It repels them—they won't come near it.

Properly applied it will never irritate the hide, nor cause loss or matting of hair.

Keeps its strength, stays active for hours after spraying.

And you will find it costs you no more than ordinary sprays. Watch it increase your milk output and keep stock in better condition by its power to relieve them of the worry and discomfort of insects. Available in all sizes from one quart up. Order today from your Shell dealer or the nearest Shell depot.

We make special preparation for the late buyer. There's plenty of time to get and erect a Unadilla, for it's the easiest silo to put up.

On 24 hours' notice we can ship your Unadilla in fine, clear, well-cured Oregon Fir stored under cover.

Only in the Unadilla can you have patented doweled staves, making any big silo extra solid and storm-defying. There's nothing to match the convenience and safety of Unadilla doors and door-front ladder. Write or wire for catalog and prices. Unadilla Silo Co., Box B, Unadilla, N. Y.

NORTHEASTERN Slants ON THE National NEWS

Huge Farm Bill Goes to White House

LARGEST farm bill in country's history, carrying appropriations totaling \$1,194,498,633, finally emerged from Congress last week and went to President for his signature. As finally passed, bill contains about \$350,000,000 more than President Roosevelt recommended in his budget. Most of the money will go for New Deal farm programs, including direct benefit payments to farmers, removal of farm surpluses, and farm tenancy program. Bill also includes funds for activities that affect general public as well as farmers, such as highways and roads, weather bureau and its forecasting services, and food and drug administration.

SLANT: Annual income of American farmers is now 5 million dollars short of pre-depression totals. Since 1929, farmers have lost tremendous total of 50 billion dollars. Against this ruinous loss, government's policy of doling out a few dollars to each farmer who cooperates with it increases taxation, makes agriculture more dependent on government, and does little permanent good.

Another Spend-Lend Program

"SAME only different" is latest spending program proposed by President Roosevelt, in letter to Senator James F. Byrnes of South Carolina. Plan calls for a revolving fund of \$3,860,000,000 to spur lagging business recovery by coaxing out private capital and putting it to work through government agencies. About \$870,000,000 would be used in current fiscal year, July 1, 1939 to July 1, 1940.

President proposes that certain government agencies be authorized to issue government-guaranteed bonds to finance projects that would eventually (it is hoped) pay for themselves. He recommends four main types of loans:

- 1. Federal Works Agency:** \$350,000,000 for non-Federal public works such as bridges, hospitals and water works; \$750,000,000 for toll roads, express highways, city by-passes; \$500,000,000 for railroad equipment to be leased to the roads.
- 2. Department of Agriculture:** \$460,000,000 for expansion of the rural electrification program; \$500,000,000 for such items in the farm tenant program as loans for farm purchases, repairs, cooperatives, etc.
- 3. Foreign loans:** \$500,000,000 for short and long term loans to foreign governments to promote American foreign trade.
- 4. Housing:** Expansion of U. S. Housing Authority's borrowing power by \$800,000,000.

Plan has been discussed at White House conference and it is reported that bill covering President's recommendations will soon be introduced into Congress, and action taken before session ends. This is fourth big pump-priming program to be launched by New Deal since 1933. During past 6 years, Congress has authorized more than 20½ billions for "recovery and relief," and of this more than 18 billions has been spent.

Commenting on President's plan, New York Times points out that he is advocating it not as an emergency measure this time but as a permanent policy of government. "The belief,"

says the Times, "that private investment must be displaced by government investment must in the end lead to state capitalism and to an increasingly State-dominated economy, the ultimate results of which are sufficiently clear abroad."

"The truth is that private enterprise will recover quickly enough if we allow it to do so. A whole network of obstacles to that recovery exists in many present governmental policies, and the first step of Government should be to remove these obstacles. In the campaign of 1932, Governor Roosevelt summed up contemptuously the policy of the Hoover Administration in these words: 'Owe more! Spend more! This was the program.' In his first inaugural address he remarked of the 'money-changers': 'Faced by failure of credit they have proposed only the lending of more money.' Does the President wish to have his own economic policies summed up in the same way." **SLANT:** It looks like it.

President May Lose Dollar Control

AT MIDNIGHT on June 30 Administration's bill to continue control of President's money powers lapsed, after hectic efforts to get House and Senate to approve it before deadline arrived. After sailing through House several weeks ago, bill met rough going in Senate last week. Republican Senators and Silver State Democrats ganged up on it and added amendments to it which would deprive President of further powers to devalue the dollar, end Administration's power to set price of domestically-mined silver, raise present silver price of 64.64 cents an ounce to 77.75 cents, and forbid any more foreign purchases of silver. About all that was left of original bill which passed House was its authority for Treasury to continue for two more years the life of the 2 billion dollar stabilization fund.

Vote, which came as complete surprise to everybody except those who were in the "deal", followed a week of filibustering on part of silver-state senators which held up enactment of several bills on Administration's must list until they got what they wanted—higher silver price.

After Senate's action bill went to joint House-Senate Committee for conference. Committee came to rescue of President's money powers and threw out both anti-devaluation amendment and anti-foreign silver purchase provision. House voted favorably on this compromise bill, which then went back to Senate four hours before midnight deadline, too late for action. As we go to press, report is that money bill will have to come up again later, possibly some time this week. In meantime, money powers granted to President three years ago are out.

If Congress fails to pass legislation at this session to continue President's devaluation powers, it is reported that President may call special session for this purpose.

Cotton Swap

FEDERAL government has found one answer to part of its cotton surplus problem. By treaty signed in London on June 23, Great Britain has agreed to trade 85,000 tons of rubber for 600,000 bales of United States cot-

ton. No money is involved in deal, which goes into effect about Oct. 1 if ratified and made effective by legislation in both countries.

Agreement provides that these stocks of cotton and rubber are to be stored and used only in case of a major war. If none develops within 7 years, they may be liquidated in a way that will not disturb world markets.

U. S. will have no difficulty in filling this large cotton order. Country now has biggest cotton surplus in its history. Domestic stocks, according to figures published last week, stand near 15,000,000 bales, more than 1,500,000 larger than this time last year.

Two other first-aid measures for cotton are being considered by Department of Agriculture: First, gifts of cotton goods to persons on relief; second, subsidizing cotton exports. Department has already worked out its stamp plan for distributing surplus food products to workers. Cotton goods would be distributed along same lines.

Congress Hustles Through Tax Reforms

DURING fortnight, Congress made new record. Bill revising taxes was shoved through both houses in just eight days from time it left House Ways and Means Committee. Average time for passage of revenue bills is said to be about 3 months.

Bill extends existing excise ("nuisance") taxes, including taxes on securities, stock transfers, lubricating oils, gasoline, electrical energy, tires, tubes, toilet preparations, trucks, autos, motorcycles, refrigerators, firearms, matches, theatre tickets, etc. It repeals remaining undistributed profits tax, substituting flat 18 per cent levy for corporations having incomes of over \$25,000 annually (instead of present graduated tax of 16½ per cent to 19 per cent); it permits corporations to carry over for 2 years losses to offset taxes during next two years, and repeals present \$2,000 limit on capital losses that can be charged against ordinary corporate income.

Another injustice which bill corrects will affect inventors, authors, professional and technical people who collect in one year income for which they have worked over a number of years. New provision permits them to pro-rate their income over years in which they worked to earn it. Case of one inventor has been used to illustrate former injustice of tax. He had worked on his invention nearly ten years, borrowing large sum of money to carry on his work and perfect his patent. When he finally sold his invention for \$1,000,000, he had to pay so much in Federal and State income taxes that he didn't have enough left to pay back all of the money he had borrowed.

Further tax changes are expected at next session of Congress. Among them may be removal of tax exemptions on future issues of government securities, and broadening of income tax base to include persons of smaller incomes.

24 Hours to Europe

HISTORY was made last week when regular transatlantic air service for commercial passengers became a reality, making it possible to travel from New York to Portugal and France in about 24 hours. Flying boats in the service are Pan-American Airways' Atlantic Clipper and Yankee Clipper, which have been making trial flights over Atlantic for a year, carrying air mail and, just recently, a shipload of reporters and radio men.

Describing trip back to New York from Portugal in Atlantic Clipper,

Ansel Talbert, Herald-Tribune staff correspondent, says: "The headwinds prevailing along the route proved no great hindrance to the clipper's powerful engines . . . and for all the departures from routine we experienced we might have been making the trip in a Pullman car. Greatest excitement which occurred aboard the Clipper was caused, not by a sudden hazard, but by seeing antics of four whales that were frightened by the hum of the Clipper's propellers. Lacking any tension, passengers lounged in comfortable chairs of airplane's several compartments and either read, chatted among themselves, slept, or looked at the sea."

Average speed of crossing on way over was 156.4 miles an hour. Coming back, wind and rain cut it to 126.3 miles an hour.

Japan Shutting China's Open Door

LIVE WIRE is now being used by Japan to enforce her blockade of British concession in Tientsin, China. Food supplies there have been practically cut off, and shortage of milk is seriously affecting hospital patients and children. Feeling against Japan is running high in England, after reports that several Britishers, including one woman, were rudely undressed and searched by Jap soldiers before allowed to cross the barrier.

Speaking to House of Commons last week, Prime Minister Chamberlain said he "hoped" for peaceful settlement of quarrel, which originally grew out of Japan's demand that English hand over four Chinese accused of political assassination. Late report from Tientsin says that Japan has warned her soldiers there to stop insulting British subjects, though blockade is to continue until Britain agrees to "cooperate" with Japan. General belief is that Japan plans to make Tientsin blockade "beginning of the end" for foreigners in China, and will not stop short of driving them out.

United States, though not directly involved in quarrel, has put in her oar. Japanese have heard from three sources — Secretary of State Hull, American Charge d'Affaires in Tokio, and American Consul General in Tientsin—that American rights must be respected. Also, when Japanese recently seized Chinese treaty port of Swatow and ordered foreign warships to leave, Admiral Harry Yarnell, commander of American Asiatic fleet, refused and announced that American naval vessels would go wherever needed to protect American citizens (of whom there were believed to be 48 in Swatow).

11,000 Miles of Trees

GOVERNMENT'S "shelterbelt" project, begun in spring of 1935, is said to be proving its worth. In five years, 127,000,000 trees have been planted to protect farmlands in seven of the semi-arid Great Plains States. The trees are now from 3 to 35 feet high, and add up to 11,000 miles of trees.

Shelterbelt program is managed by U. S. Forest Service, with WPA providing the planting labor and funds for growing seedlings, buying needed equipment, supervision, etc. Trees are planted on windward side of individual farms in demonstration belts, and take up about 7 per cent of a farm's acreage. Sections where plantings have been made include western third of Minnesota, half of North Dakota, a third of South Dakota, four-fifths of Nebraska, half of Kansas and Oklahoma, and half of the Panhandle of Texas.

Typical planting of a 320-acre farm

is said to include a primary shelter belt of 10 rows of trees, about 100 feet wide, to protect the farm from damaging hot winds which take soil's moisture and blow off top-soil. Smaller belts on the farm, on quarter section lines, contain from 1 to 3 rows of trees. In winter, trees prevent snow from being blown off the land which needs it for moisture and protection.

Penn State Producers Cash In

PENNSYLVANIA crops brought bigger returns in 1938 because of increased efforts of growers in that State to grade and label their farm produce according to official State or Federal

grades of quality. Recent report of Pennsylvania State Department of Agriculture states that farm value of these graded products exceeded 4 million dollars, and that the standardization program brought many other benefits to those who took part in it—increased consumer demand for Penn State products, less waste in handling, more cash sales and fewer consignments; also, greater protection for the consumers who bought the carefully graded and labelled produce.

Good Books to Read

THE GIRL WHO WAS MARGE, Edith Talant. Filled with enthusiasm over the fine work of Sir Wilfred Grenfell and his mission, Margaret Lovell and her young

sister volunteer for a summer's work of teaching in far-off Labrador. Their adventures there during that short northern summer were many and various. Although the story itself is fiction the background is authentic, written from the author's own experience of several summers' teaching up and down the coast of Labrador and Newfoundland. Young people will thoroughly enjoy this book.—J. E. Lippincott Co., Philadelphia, Pa. \$2.00.

Good Movies to See

SECOND FIDDLE. A combination of talent—Sonja Henie, Tyrone Power, Rudy Vallee, Edna May Oliver, in Irving Berlin's picture. For the first time on the screen, Sonja skates the tango with a partner, and the production includes Irving Berlin's six new song hits.

CHEVROLET TRUCKS

in all ways
It pays Δ to buy Chevrolets

Lower Prices

Lower Fuel Costs

Lower Upkeep Costs

Chevrolet is the nation's largest builder of trucks, because buyers of single trucks and buyers of large fleets both agree that "it pays in all ways to buy Chevrolets!"

It pays in dependable performance, for Chevrolets are real quality-built trucks through and through, with exclusive truck engines, exclusive truck frames—all parts being designed and built for heavy duty and long life.

It pays in modern features, for Chevrolet brings you every desirable up-to-date advantage, from a sturdily built chassis to the new comfort cab, with vastly improved visibility

and many other comfort and safety factors for the driver.

And it pays in immediate and long-term economies, for Chevrolet trucks sell in the lowest price range, and the famous Chevrolet Valve-in-Head Truck Engine assures lowest cost for gas, oil and upkeep.

Visit your Chevrolet dealer today . . . ask for a thorough demonstration of the Chevrolet truck best suited to your particular needs . . . and you will receive convincing proof that "it pays in all ways to buy Chevrolets!"

THE THRIFT-CARRIERS  FOR THE NATION

The Effect of Price Fixing Upon Milk Consumption

By LELAND SPENCER

IN THE preceding article I expressed the opinion that the higher prices to be set for milk when the Federal and State orders go into effect again July 1 would not have much immediate effect upon either consumption or production. We shall now consider what evidence there is concerning the effect of price changes on the consumption of milk.

Leland Spencer

Retail prices of milk and cream are not fixed in the Federal and State orders but nevertheless are determined rather definitely by the prices which are set for Class 1 and Class 2A milk. On July 1, the retail price of milk probably will be raised from 12 cents to 13 cents a quart on retail routes, and from 7 or 8 cents to 9 or 10 cents at stores. Thus there will be an increase of 1 cent on retail routes and nearly 2 cents at stores. The price at welfare depots will remain at 8 cents a quart, and the sales of "8-cent" milk undoubtedly will increase.

About 15 years ago Dr. H. A. Ross, who was then working at Cornell, made a careful study of milk sales in the New York market. He traced the sales of milk week by week for a period of five years. His conclusion was that the curtailment of sales following a 1-cent increase in the retail price was almost negligible; similarly the increase in sales following a 1-cent recession in price was barely noticeable. During the years covered in Dr. Ross's study there was only one instance of a 2-cent rise in the retail price of milk. On that occasion the sales fell off as much as 6 to 12 per cent for the different grades of milk. The price for Grade B milk was then 18 cents a quart. After falling back to 15 cents the price was stepped up 1 cent at a time until it again reached 18 cents. Following the last 1-cent increase, sales fell off more than 5 per cent, indicating that consumers were inclined to rebel against any price higher than 17 cents a quart.

This study by Dr. Ross was made

at a time when the buying power of city people was much greater than it has been recently. It seemed probable to us that consumers would show more reaction to changes in the price of milk when they have to watch their expenses more closely. To make sure about this we have studied the records of milk sales in New York for the years 1933 to 1938. This work was done by Dr. Charles Blanford, who reported the results on this point as follows: "Although the data are too variable to justify definite conclusions, it is apparent that a 1-cent increase in the price of milk caused only a very slight reduction in sales, considerably less than 1 per cent. Likewise a 1-cent reduction in price brought less than 2 per cent increase in sales during the first week. No significant effect could be traced beyond the second week." He also found that changes of 1 cent in the price of a half-pint of cream brought only about 2 per cent change in the sales of cream.

During the period of this study the retail price of milk was never changed more than 1 cent at a time. However, changes of 2 cents a half-pint in the retail prices of cream brought increases or decreases of about 5 per cent in the quantities sold.

The results indicate that the demand for milk continues to be rather inelastic. Nevertheless, it would be a serious mistake to conclude that the price of milk can be manipulated without consideration for consumers and their attitude toward these prices. Although we have not been able to measure their demand precisely, it is probable that families with very low incomes show more reaction to changes in the price of milk. In New York City these families buy mostly unadvertised brands of milk at independent grocery stores, and their purchases are not sufficiently represented in the records that were available for the studies I have mentioned.

There is also the possibility that consumers may cut down their purchases of milk gradually if the price is maintained at a high level for a long time. As we showed in a recent article, the consumption of evaporated milk has been increasing steadily. The most probable reason is the fact that evaporated milk has become cheaper and cheaper in comparison with fresh milk.

A price of 13 cents for milk delivered at the doorstep, or 9 to 10 cents

New York Milk Prices with Comparisons

	May 1939	May 1938	May 1910-14	April 1939

*Net pool return without special location or upstate city differentials.

†Adjusted for change in seasonal variation of price.

EDITOR'S NOTE—This is a relatively new comparison of milk prices. If you are interested in receiving similar figures for previous months, drop a post card either to American Agriculturist, P. O. Box 367, Ithaca, N. Y.; or to Prof. Leland Spencer, Dept. of Ag. Economics & Farm Management, College of Agriculture, Ithaca, N. Y.

for milk sold over the counter in New York City is not excessive in comparison with the prices of other foods or with milk prices in other markets. Judging from past experience, consumers will not reduce their purchases much when these prices go into effect, although in the long run they probably will take a little less milk than they would if the prices were 1 or 2 cents lower. The fact that the demand for fresh milk is rather inelastic makes it possible to increase the income of dairymen for a time, at least, by fixing the price for fluid milk somewhat above the competitive level.

In an early issue we shall discuss the effect of price fixing upon the supply side of the milk market.

Advertising Increases Milk Consumption

The metropolitan New York market is consuming upwards of 20,000,000 more quarts of milk every month than it did in 1935, according to the latest figures issued by the United States Department of Agriculture. This increased consumption, running counter to the general trend elsewhere in the United States, is a tribute to the effect of advertising.

According to Commissioner Holton V. Noyes, of the Department of Agriculture and Markets, it was because of this showing that the State authorized the continuation of the Milk Publicity Campaign for another year. The new campaign, jointly sponsored by producers and distributors and conducted under the supervision of the Department of Agriculture and Markets, is starting July 1st.

The advertising, as previously, will be designed to increase the market for milk by stressing that it is more than a food for babies. Appeals used in the last four years have been directed to adults and to boys and girls of school age. The beneficial effects of milk on appearance and physical condition have been emphasized to grownups, while its body-building properties have been pointed out to the younger generation. Variations of these proven appeals will be employed in the 1939-1940 milk publicity campaign.

Under the supervision of the Department of Agriculture and Markets, the Bureau of Milk Publicity in Albany will coordinate the advertising with the Department's own merchandising and promotional work in behalf of the milk industry.

Rain Making on Thirsty Ground

(Continued from Page 6)

50 pounds. The lines are either turned occasionally by hand or are moved by means of water driven oscillators. The lines are installed on posts or suspended from cables and special roller bearing paddles are available. Some growers increase the area to which irrigation is available by moving the lines

from place to place. In this case, they may be carried on temporary posts, on potato crates, or even laid on the ground.

This type of irrigation requires 8 to 10 hours to apply the equivalent of an inch of rain. Even rather heavy soils can be watered without erosion or puddling. This method of watering is used on market gardens near almost every city and the South Jersey area in the vicinity of Bridgeton has hundreds of acres watered in this fashion.

EDITOR'S NOTE: In an early issue Paul Work will discuss the whirling-head method of irrigation as well as the engineering angle.

Low Fluid Milk Prices

do not compare favorably with returns from Selling Cream and Diversified Farming.

That is why so many farmers are changing to cream.

Cash received for the butterfat in cream amounts to almost as much as some get for the whole milk. Additional returns from feeding the skimmilk are better than the average price of farm products.

Sell Cream and feed skim to calves, pigs and chickens for best results.

We offer you our Cash Market for all your cream. Payment made promptly for each shipment at top market price.

BUFFALO, N. Y.

from Skeff's Notebook

Apple Institute to Meet

THE ANNUAL meeting of the New York and New England Apple Institute will be held at Springfield, Mass., July 11, followed by the directors' meeting the following day. I had the pleasure of attending both meetings last year and I would advise all who are interested to make a special effort to be on hand this year.

John Lyman of Middlefield, Conn., who has been president of the institute since its inception five years ago, has announced that he will retire this year. If he sticks to that intention, he will retire at a time when the institute is firmly established, is enjoying greater prestige than ever and is in good financial shape. A year ago the institute had a deficit of more than \$5,000, all of which has been wiped out.

In the trade the institute is recognized as the first sustained effort by apple growers to promote apple sales. For years it had been losing markets to all kinds of competitors and growers seemed indifferent. Even when friendly groups in the trade wished to co-operate they found no organization with which they could work. Growers appeared to be interested only in producing, and seemed indifferent whether or not apples found a market. No claim is made that the picture is changed entirely, but the institute has made a good start and it now is up to growers to see that the work is carried on with renewed vigor. Large crops of all fruits are in sight this year, so the need will be more than ever apparent.

To Advertise Cherries

A campaign among growers of sour cherries to pledge one-eighth of a cent per pound for advertising and promotion appears to be successful. The campaign is being conducted in New York, Michigan, Ohio and a few other states. Horace Putnam of Lyons is president and Carl Wooster of Union Hill secretary of the New York group, which seeks to sign up a minimum of 18 million pounds. The campaign is based on securing at least 75 per cent of the total of last year's crop of 24 million pounds, all of which were grown in Western New York.

Summer Meetings

Don Ward, Onondaga County agent, is general chairman for the annual field day of the Empire State Potato Club which will be held at Gardner Brothers' farm at Tully Aug. 3. The Gardners are among the oldest certified seed growers and usually have about 80 acres. It will be recalled that a year ago approximately 12,000 persons turned out for the field day at Orchard Park.

The summer meeting of the State Horticultural Society will be held at Cornell University, but the exact date has not been fixed. Secretary Roy P. McPherson said it will be between Aug. 15 and 18.

New Laws

IN THE June 10 issue we gave a summary of bills then before Governor Lehman. Here is a final report on the fate of these bills. The following were signed and are now laws:

1. Providing for nominal registration fee of \$1 for trucks and trailers used strictly in the farm business.
2. Amending the unemployment insurance law to clarify the term "farm labor" and definitely to define exemptions.
3. Providing that only the highest grade cheese can be stenciled with the terms "New York State Whole Milk Cheese" or "New York State Whole Milk Washed Curd Cheese."
4. An appropriation of \$50,000 to finance the state label plan. Labels will be sold and funds turned back in-

to the state treasury.

5. An appropriation of \$310,000 for milk advertising. Milk will be taxed $\frac{3}{4}$ c a hundred and the money turned into the state treasury.

6. Requiring county highway superintendents to remove weeds and brush along roads between July 15 and August 15.

Also signed by the Governor were bills providing for the issuing of separate hunting, fishing and trapping licenses, and appropriating \$12,500 for the state exhibit at the World's Poultry Congress.

The following bills were vetoed:

1. Requiring itinerant truckers who buy farm produce for resale to register with the Department of Agriculture and pay a fee of \$5.
2. Suspending the establishment of

central schools for one year.

3. Making local authorities responsible for administration of home relief.

4. Making it a misdemeanor to interfere with a person driving a motor truck while it is loading or unloading goods.

5. Requiring a mark of origin on all merchandise imported into the state.

Also vetoed by the Governor was a bill appropriating \$10,000 for research in vegetables at the College of Agriculture. Governor stated he was in favor of research, but that the regular budget carried sufficient appropriation.

At this writing, the outcome of the state budget disagreement is uncertain. The Legislature is in a special session following court decision that its action in cutting the budget was not according to the law.

Grange Bread Baking Contest News

Another Manufacturer Offers Prizes

MORE prizes have been added to the list of Grange Bread Baking Contest awards which we published last month. From Perfection Stove Co., of Cleveland, Ohio, comes the news that it will give a No. 142-GE Perfection Oven to each of the four highest State winners; also, 110 Perfection Stove Wicks to Pomona winners. A list of State and County prizes was given on page 10 of the May 27 issue.

Every day it becomes more apparent that when *American Agriculturist* and the New York State Grange sponsored this bread contest, they started something! One Subordinate Grange winner—Mrs. Edna Shaver, of Shells Bush Grange, Herkimer Co.—writes that she is not in the habit of making bread and only took part in the contest to see if she really could make a good loaf. Now her family of seven says that she will have to make it often.

Three Grange brothers did the judging at the bread contest held by DeRuyter Grange, Madison Co. Chairman Mrs. Nell P. Ryder writes: "I have found that men prove to be pretty good judges of cooking. They each graded each loaf, then added their totals for each loaf and averaged them. There was no doubt in anyone's mind as to the judging. It was really perfect and none of the women could have done better!"

Letters from many other Grange chairmen hint that the men were keenly interested in the contest. Chairman Mrs. Arthur Lyker of Mapletown Grange, Montgomery County, writes: "The committee in charge of refreshments sliced the loaves after the judging and put the heaping plates of delicious bread on the tables, together with butter, jelly, salad, cake, and coffee. But before that, during the judging, it was very amusing to see the men and boys edge around the kitchen corner where the judges were busy. They tried to hurry them and offered their assistance in the tasting process."

One Grange—Midland, of Sullivan County—had the bright idea of offering a special prize to the Grange brother who made the best loaf of bread for their contest. Midland's deputy William Whittaker accepted the challenge and almost won the contest. His loaf of bread scored 93 per cent, trailing the winner by just a few points.

We wish we could print more of the interesting and lively accounts of contests which we are receiving daily from Grange Chairmen of Service and Hospitality Committees, but this time we need the space for winners' names.

Names of winners of Subordinate Contests are pouring in so fast that it is hard for us to keep up with them. Here are those reported since the last list we published:

COUNTY	GRANGE	WINNER
Allegany	Alfred	Mrs. Cecil Cornulious
	Canaseraga	Lura Sommers
	Genesee Valley	Mrs. Willard Young
	Inavale	Mrs. Grace Clark
	Rushford	Mrs. Oaniel H. Williams

A New Portable Milking Machine

THE INTERNATIONAL HARVESTER CO. has developed a new portable milker (illustrated) which makes pipelines unnecessary. The pump unit weighs only 175 lbs., and power is supplied by a $\frac{1}{4}$ horsepower motor with choice of 110-volt alternating current or 32-volt direct current. A 50 ft., 3-wire, rubber-covered extension cord is supplied with each outfit.

An additional safety feature is an automatic circuit breaker to prevent motor damage from overheating or overloading. The portable vacuum pump is 21 $\frac{1}{2}$ " wide, 45" long including handle bars, and the height to the top of the pump is 25".

The Unitractor is a new type of garden tractor developed by R. D. EAGLESFIELD, 300-400 S. LaSalle St., Indianapolis, Ind. It is powered by a 1 h.p. gasoline engine which is constructed to give ample power for plowing gardens, running lawn mowers and cultivating. It also has an attachment for dusting crops and orchards.

In a recent talk over radio station WGY, George H. Smith, Secretary of the EMPIRE STATE GAS & ELECTRIC ASSOCIATION, discussed "Playing Safe With Electricity." Mr. Smith emphasized safety in the handling of radio aerials, kites and electric fences. Said he:

"Electricity when properly handled and

used is perfectly safe, but when not so used, it may become dangerous.

"No radio aerial should ever be strung over or under a power wire, nor should they be placed near poles carrying electric wires of any kind. There are aerials being designed today for home installation made similar to the horse whip type you have seen on automobiles. If you decide to take your outside aerial down, please remember that there is just as much danger in removing it as there was in installing it. You had better call your power company, and they will be glad to remove it for you if it is over their wires. "Tell your boys not to fly kites over wires and not to use wire or tinsel twine. Use only cotton string. Do not use a kite with metal ribs. Tell them particularly not to climb poles to release kites caught in wires.

"Electric fences are a new hazard if not properly equipped and installed. Let no one tell you that he can build for you a home-made cheap device that is safe. What is safe for some people is not for others."

THE OLIVER FARM EQUIPMENT CO. has announced the appointment of Walter Borst as manager of Oliver's Nichols and Shepard Division Plant at Battle Creek. The appointment became effective June 1. For the past 10 years Mr. Borst has been superintendent of the Harvester Works of Deere and Company, Moline, Illinois.

A view of the kitchen at the electrified farm at the New York World's Fair. This kitchen is designed to save steps and is literally a homemaker's dream. The refrigerator has a zero temperature section for storing frozen foods, and equipment includes every electrical device to save work in the kitchen. The demonstrator has a microphone attached to her dress and as she works, she talks to the crowds which gather at the windows.

NEARBY MARKETS for NEARBY POULTRYMEN

Egg Quotations

By J. C. HUTTAR

ALTHOUGH the grade or class names under which eggs are quoted in the larger markets do not change very often they do seem to keep egg producers fairly well confused. To one who uses them in daily trading they seem simple enough. But that is because he understands just why each

grade name has been chosen and what it means in terms of quality and dollar and cents value. He probably has some dealing each day with the folks who make the names and through actual business and talk it's perfectly clear to him just what is meant by each grade name and how each grade compares in value with all the others.

J. C. Huttar

I haven't had much personal experience with other egg trading centers than New York. I guess the majority of my readers either deal in New York with their eggs or base their deals on the quotations of that city. So I'll talk about New York's present egg quotations.

Who Quotes Eggs

In this column about two years ago or so, I took up a lot of space describing the three market reporting agencies in the New York City wholesale market. I won't go into all that again. I'll just remind you that there are three which keep a pretty constant check on each other. Two of the three are public agencies and the third is private. The first two are the departments of Agriculture of the State of New York and the United States and the other the Urner-Barry Publishing Company.

Specifications

The really astounding thing about egg market quotations is that a good share of the grades quoted have no definite specifications that anyone can put a finger on. To be sure such grades are almost always based on other grades for which definite qualifications are written up, but the quality, size or value relationship is not always the same. Most of our Nearby eggs fall into these unspecified classes. Prices on them (in white eggs, not in browns) are based on grades in which eggs from other parts of the country are mostly found. That has always seemed to me to be a weakness.

I want to point out here that I believe the market reporters are doing the best they can in reflecting true values day by day. After all, it's not up to them to draw up formulas for grades or make up trading rules and say to the folks who buy and sell eggs, "Here now, you fellows will have to follow these rules so that we can tell the world exactly what each kind of an egg is worth." They have no authority to do this.

The U. S. Department of Agriculture has had specifications for wholesale egg grades written up for over twenty years, I believe. But egg men claim you can't trade by them. That Department is thinking of revising those grades at the present time. Some wholesale markets have been using these Federal Grades for some years already and perhaps more will after they are revised.

In New York the only written specifications for eggs in use in wholesale trading are those of the New York Mercantile Exchange. Since most egg

dealers are members of this organization and since it provides a place and facilities for actual trading it is to be expected that there is more business done on the basis of these grades than any other.

Nearby Eggs

So far as Nearby eggs are concerned there are only six of the twenty or more "Exchange" grades which affect them—three for white eggs and three for browns.

The three white egg grades I refer to are Specials, Standards, and Mediums.

SPECIALS are the best grade of large, all white eggs described by the Exchange. Briefly, they must be clean, sound of shell, chalk white in color, of good quality, and weigh at least 46 pounds per 30 dozen case, which is 24 $\frac{1}{2}$ ounces to the dozen. A small tolerance is permitted on each point. That is, there may be a few dirty, a few cracked, a few tinted, a few off slightly in quality and even a very few completely inedible or blood spots. Altogether all these slight defects may total six dozen of the thirty dozen eggs, but not more.

STANDARDS are also large white eggs of generally lower specifications. In each of the points mentioned above a slightly lower level or greater tolerance is permitted and they need only weigh 45 pounds to the 30 dozen case or 24 ounces to the dozen.

Having dealt with these grades for six years and having seen thousands of cases of Nearby eggs and knowing the history and handling of some of them I would say this about the two grades just mentioned.

Eggs given just ordinary care and sent to market about twice a week would probably grade Specials if size, color, cleanness and breakage were O. K. Or eggs given a little bit better than average care but only shipped once a week would go into this grade so far as quality is concerned.

STANDARDS are eggs which definitely show some age or holding under dry or warm conditions in the summer or badly chilled in the winter so far as quality is concerned. Or they may be eggs of good quality poorly graded, speckled with many creamy or tinted eggs or some dirties or too much breakage.

MEDIUMS are a grade described just like Specials except for size. The minimum weight requirement for these is 40 pounds per 30 dozen crate or an average of about 21 $\frac{1}{2}$ ounces to the dozen.

So much for the Exchange white egg grades. In browns the Exchange has the same three grades with the same names and same requirements except for shell color. No mention is made of what shade of brown is required in the Exchange rules.

Now I realize that what I have said here is only a foundation on which you can build a building. I shall try to build the building in the next issue. In that discussion I'm going to try to make as clear as I can what is expected of the producer in furnishing eggs of four or five sizes and two colors to qualify them for the various Nearby quotations. Or to put it from your point of view, what you can expect for the kind of eggs you ship.

Congress Brief

Membership work in New York State is going forward in good shape. Apparently this state as well as the rest of the Northeast will be well represented at Cleveland in about four weeks. Will you be there? It's going to be a grand show. I'll be looking for you.

NEARBY MARKETS for NEARBY POULTRYMEN

More Questions By L. E. WEAVER

Bare Chicks

Why is it that heavy chicks, particularly, sometimes fail to feather out as they should?

One reason for this is crowding. It is not satisfactory to attempt to tell how many chicks you should have to

L. E. Weaver

100 square ft. of space. Chicks which may have plenty of room when they are young soon grow and become crowded. Therefore, the best measure is to say that you should never have more than 1½ lbs. of chicks per square ft. of floor space. Moving cockerels as soon as they can be distinguished helps to relieve congestion, and the use of wire sun porches increases the space in which the chickens can run.

Another way in which chicks are crowded is by insufficient hopper space. Provide enough hopper space so that practically all of the chicks will be able to eat at the same time.

Burn Dead Hens

Is it necessary to burn dead hens?

Not absolutely, but it is important to dispose of them in some way so there is no danger of spreading disease throughout the flock. On a farm where poultry is an important enterprise, there is no better way of doing this than by burning them. One simple way of doing this is to punch several

holes about ¼ of the distance up an oil drum, and then cut a hole near the bottom for the door. This can be set on end, the dead hens put on rods which are put through the holes to form a grate. Then a fire is built at the bottom and the birds are soon consumed.

Scaly Legs

I have a few hens whose legs are scaly. What causes this and how can I cure it?

A mite so small that you cannot see it burrows under the scales on the legs. A simple way to kill these is to dip the legs of the affected birds in a mixture of ½ pint of kerosene and 1 pint of raw linseed oil. Be careful that this does not get onto the feathered portions of the legs as it is likely to burn the skin.

If the legs are very badly affected, it may be wise to wash the legs first with soap and warm water to remove all of the loose scales.

Broody Hens

What is the most satisfactory way to break up broody hens?

The first thing is to break them up quickly. It is much easier to break up a broody hen the first day she shows symptoms than it is to wait several days. Provide a broody coop covered with wire so that air can circulate easily around the hen. Then feed her a good laying ration. Some poultrymen put a leg band on a hen every time she becomes broody. This way they can spot the ones that are consistently broody and sell them.

Rats

We have too many rats. I have tried poison and traps; but they are still with us.

One thing that you can well do is to get your neighbors interested in rat control and put on a neighborhood drive. It is difficult for one man to control them where a whole neighborhood is infested.

Next, I suggest you try fumigating with cyanogas. Some rats are very cagey about eating poison bait, but when you blow poisonous dust into their burrows, there is no way they can avoid it.

Cod Liver Oil

Is it necessary to feed cod liver oil to laying hens in the summer?

Yes, if the hens are confined. No, if they are running outside. Since all commercial laying mashers contain vitamin D supplements of some kind you need not be concerned about this question unless you are mixing your own mashers.

"I thought it was only the HAIR they were wearing off the neck this year."

Let's Have a Picnic!

by
MRS. GRACE
WATKINS
HUCKETT

EATING outdoors is so healthful and so delightful that it ought to be a regular part of family fun in the summer time. There is nothing in the world like it for producing keen appetites and relaxing tired nerves.

To make it as easy as possible to "pick up and go" at a moment's notice, have a picnic basket always packed with the necessary things. An ordinary market basket fills the bill for a small family; a big hamper or clothes basket for a large one. If the picnic spot is to be reached on foot, you can use a rucksack, that most convenient shoulder bag which walkers abroad use to carry their necessities. In foreign countries, it is a common sight to see them tramping merrily along, pack on back and stick in hand.

A real camper, of course, can prepare a tasty meal with only a frying pan and a forked stick, but few of us want to be so limited in our equipment. Have the following articles always packed and ready to go, and half the worry of preparation will be avoided: salt and pepper, sugar, paper napkins, a can opener, a bottle opener, a corkscrew, holders for hot pans, plates and cups either paper or tin, aluminum or enamel; knives, forks and spoons, a bread knife and a paring knife, long-handled stirring spoons, long-handled forks, and a long-handled broiler; a large-sized coffee pot; and plenty of matches and old newspapers. (Or, if you prefer, buy a ready equipped kit or basket in the stores. They are available in almost any size or price range.)

Weather has a lot to do with the kind of meal prepared; also whether it is to be served as an entire meal or whether it is to supplement foods brought along. At any rate, the menus should be worked out in advance, for balancing the meal is as important for picnicking as for the home table.

Let's start with the main dish, meat for instance. There are all kinds of meat casseroles which may be cooked at home and kept hot for several hours if carefully covered with a lid and wrapped in several thicknesses of newspaper. One may even slice ham thin, fry it at home, pack it in a hot casserole and keep it hot until reaching the picnic grounds.

Meats which lend themselves to cooking over the camp fire are steaks, chops, frankfurters and weiners, hamburgers and "kabobs". Kabobs are little chunks of meat made famous in Armenian restaurants. They are strung on skewers with slices of onion in between. These skewers are kept turning until the meat is browned nicely on all sides and cooked thoroughly. If you have no skewers, a handy husband can devise some from clean, heavy wire, sharpened at the ends. Thin, flat cakes of hamburger broiled in the pan—with onion if you like—just fit those big round hamburger rolls that children like. The other meats may be cooked in the pan or in the wire broiler or on the proverbial stick, letting each cook his own if it is that kind of a party.

But the garden's contribution to the meal is most tempting, both in color and crispness — tender leaves of lettuce, crisp radishes, juicy

tomatoes, cooling cucumbers, melons or whatever else is available. Berries and fruits are equally welcome on the picnic menu. Berries may be washed and chilled and taken in a cold jar wrapped in several thicknesses of pa-

per, if there is no thermos bottle handy for that purpose. Thermos bottles or jugs are invaluable for taking a prepared lunch. They serve for beverages either hot or cold, and the jugs with wide mouths will hold even boiled potatoes or corn on the cob.

For boiling vegetables over the camp fire — sweet corn, potatoes, or whatever — some sort of a kettle with wire bail and a lid that fits is necessary. Some stores even show a nest of such kettles for real camping. The old standby of canned vegetables is always a picnic possibility, but as long as the fresh ones are available they are far preferable. Any food canned in tin may be heated in the can by submerging it in hot water. This helps somewhat with dishwashing but requires some skill in opening in order to avoid a burn.

The raw vegetables should be chilled and crisp before starting. If they are kept in a cold pan or damp cloth, they will stay fresh for some time. It is often convenient to slice the tomatoes or cucumbers for sandwiches at the picnic table, the bread having been buttered or mayonnaised before leaving home.

In addition to the fresh, raw stuff from the garden, a cooked vegetable is often possible, green peas, escalloped asparagus or casserole of spinach with white sauce beaten up with egg and baked, or string beans. Fresh beets pickled, carrots or onions in white sauce, and canned vegetables are other suggestions.

A sweet dish of some kind tops off the meal. It may be simply cake or cookies with lemonade, fruits fresh or canned or ice cream. Whatever it is, it should be simple and easy to prepare and to transport.

Milk is an item too often omitted from the picnic menu. Every child should have his regular quota besides having enough for the adults who wish it. A holiday touch may be given by adding a little fruit or chocolate syrup to milk.

AL. COLEMAN
— '39

Hot cocoa is a convenient way of providing one hot dish in an otherwise cold meal; this covers the milk requirement also.

No fruit drink has yet surpassed good old lemonade. It seems to blend with almost any flavor besides being one of the very best thirst quenchers. On most farm cellar shelves are bottles of home canned fruit and berry juices—or they should be there. There should be some tart ones, currant, rhubarb and sour cherry to combine with the more sweet ones. Lemon juice can always be added. Besides these home canned juices there is the great assortment of commercial canned juices, grapefruit, pineapple, orange, loganberry, etc. Whatever combination is made, just bear in mind that color is important, as well as flavor.

Now that state parks and camping areas have open fireplaces, it is comparatively easy to do a certain amount of cooking when going to such spots for a picnic. It would be a pity, however, not to have a fireplace of one's own which is always available when one feels in the mood for an outdoor meal. There are few farms or homesites where such a fireplace could not be built easily by members of the family. There are several types of such fireplaces, those of a permanent nature built of stones and cement, or the movable kind of loose bricks piled together to support a grate with suitable chimney for draft and smoke removal. This type has the advantage of being able to be switched around according to the way the wind blows.

NOTE: There is not space here to give detailed instructions about building this movable fireplace. If you wish to send 3c to cover mailing costs, we should be glad to forward you a mimeographed sheet of instructions. Address American Agriculturist, Savings Bank Building, Ithaca, New York.

Size 16 requires 3 yards of 39-inch material; 2 yards of ribbon.

SUNSUIT PATTERN No. 11200 is a roomy playsuit that tells the story of the old woman who lived in a shoe. Youngsters love the straps that won't slip from the shoulders. A brimmed hat is included in the pattern. One size only, suitable for sizes 1 to 2 years. Sunsuit and hat require 1 1/4 yards of 35-inch material; 2 packages of binding.

TO ORDER: Write name, address and pattern size and number clearly and enclose 15c in stamps. Address Pattern Dept., American Agriculturist, 10 North Cherry St., Poughkeepsie, N. Y. Add 12c for a copy of our new summer fashion catalog.

Today in Aunt Janet's Garden

Seedtime and Harvest Meet

THE business of watering is more than standing with a hose or sprinkling can and wetting the foliage of plants. In fact, watering may be actually harmful unless a thorough soaking of the ground takes place. If the surface only is wet, this tends to draw roots upward where they suffer more from drought and lack of nourishment than if they turn downward in search of food and water.

Besides the ill effects of cold water applied under pressure, there is the other probability of disease which may be encouraged on damp foliage during warm weather. For this reason roses particularly need to be watered in early morning, so that the foliage has time to dry. Whatever way is chosen for watering the plants, the water should be as nearly as possible the same temperature as the air, should be given in sufficient quantities to soak the ground, and should not damage the plant by being too forceful. The more nearly like a gentle rain the better the watering.

Window boxes need watching to prevent drying out. They require regular cultivation and fertilizing just as any garden does. Pulverized sheep manure watered into the soil is recommended.

Now that columbines and delphiniums have finished flowering, their seeds ought to be planted for a new supply of plants—that is, the varieties which you wish to keep. If you do not want the seed, the old flowers should be cut off before seeds form, as that is too much of a drain on the plant. The seeds of both plants germinate better if planted immediately, rather than waiting until next spring. Columbine takes about three or four weeks to germinate.

Seeds could be planted in the open ground and kept moist. A cold frame shaded by lath is much better, however. Pansy seed should go in by the first of August; if you have not already ordered, it is wise to do so soon, for only the best pansy seed should ever be planted.

The polyantha primrose and painted daisies (pyrethrums) are best divided at this season rather than in the fall. Although my intentions were perfectly good last year about dividing my painted daisies early, it was fall before I got around to the job. The result this year is small plants and few blooms, where last year I had masses. In the case of primroses and pyrethrums a clump is composed of many small plants which separate naturally when lifted. Each small division needs to be put into the ground a little deeper than before, kept covered for a few days and watered in case of dry weather. Division is the only way to keep either of these plants true to color, since seeds cannot be relied upon to do so.

Give Yourself a COOL LOOK

GIVE CLOTHES that lighthearted look to offset the heavy feeling of hot weather! There are many ways to give this lightsome lift to the costume—heartshaped neck, short puffed sleeves, tiny bows, rippling ruffles, crisp prints, gay fabric shoes, off-the-face hat.

Voiles are strongly in favor even for evening dresses. Dotted swiss and frosted organdie are other favorites. White ground with small allover or sprawly patterns in lively colors are particularly popular.

DRESS PATTERN No. 2907 is a go-everywhere frock in sizes 12 to 40.

WHY 3 OUT OF 4 JELLY CHAMPIONS STICK TO CERTO:

1. Certo is the "tried and true" pectin that takes the guesswork out of jelly-making!
2. Certo alone gives you 79 recipes—a separate tested recipe for every fruit!
3. Certo reduces boiling time to 1/2 minute for jellies—only a minute or so for jams!
4. Certo jellies retain fresh fruit flavor—no "boiled-down" taste!
5. Certo gives you half again more glasses—makes all fruits jell perfectly!

Look for the tested recipes under the label of every bottle of Certo—a product of General Foods.

Says Mrs. V. J. Daniels whose jams and jellies made with Certo took 7 prizes at the 1938 Midland Empire Fair.

Insist on CERTO THE "TRIED AND TRUE" PECTIN THAT TAKES THE GUESSWORK OUT OF JELLY-MAKING!

MUFF — A Serial Story

By C. A. STEPHENS

THE STORY THUS FAR

Christened Henry Nemo, the name "Muff" stuck to our hero because his mother tucked him into a muff and abandoned him on the doorstep of two New England spinsters. A crimson birthmark around his neck was referred to by village gossips as "the gallows mark."

When 14 he was hired out to farmer Glinds for \$7 a month. He refused to stay and Glinds refused to pay him. Thereupon Muff stole oats from Mr. Glinds' bin equal to the value of the work he had done. He was discovered, arrested, and sentenced to Reform School. On the way there he escaped.

Muff was captured and sent to the school again, but escaped a second time. After wandering a bit, he stopped to examine the surveyor's instrument used in construction of a railroad, and was hired by Mr. Lothrop, who was destined to have an important influence on Muff's life.

On Lothrop's advice, Muff returned to the reform school, where good behavior soon gained his release. During his stay at the school, Mr. Lothrop died. Following his release from school, Muff went back and worked unrecognized for Glinds until he had repaid him for the oats.

Muff left Mr. Glinds' place to return to his boyhood home. Overcoming the opposition of the townsfolk he took up the work of woodturning and eventually established a successful business, principally the manufacture of wooden spools. During his experimental efforts he happened upon a method of producing wood pulp for the manufacture of paper.

* * *

MUFF heard nothing more of the pulp till the following April, when he received from the mill a roll of white paper, and also by mail a letter, saying that a "very fair quality of paper could be made by mixing pulp with rags, and that though others had manufactured a similar paper, a market could be found for all he could produce at a certain stipulated price.

On hearing this report, Muff had several slabs of coarse, tough granite quarried and set in his mill; and he then rigged gearing for holding and rubbing blocks of poplar wood to meal against the surface of the granite, and went on experimenting for a month or more, in some cases having the granite slabs revolve like a mill-stone; in others, revolving the poplar blocks against a stationary slab, the object in both cases being to grind the wood to fine slivers.

For this same purpose, too, he invented a number of other devices, and soon after made proposals for five hundred cords of poplar wood, at five dollars per cord, to be ground into paper pulp. A new industry was then added to the spool business, and a new mill was built during the following autumn.

Another accident, which occurred during the progress of these experiments, illustrates Muff's character in quite another direction.

While grinding wood bolts to meal, a fire—from friction probably—happened in one of the buildings of the spool factory, consuming the building and entailing a loss of four or five hundred dollars. The mill was insured, and the insurance company sent a person to adjust the loss. There was no hesitation on the part of this agent in appraising the damage at four hundred dollars, and it would have been paid in due course. But just as the agent was taking leave, Muff came out to the road, and in his blunt way, said:—

"Wait a moment, sir. I have been thinking over the origin of this fire, and I have come to the conclusion that it

was due to unjustifiable carelessness on my part. I ought not to have left those bolts running in the way I did. I really do not think the company to be justly holden to pay for a loss under such circumstances. So I shall make no proof of loss and surrender the policy, to be renewed on my new building about one month hence, if you please."

The agent was, of course, glad to avoid payment. Being a man of not over strict honesty himself, perhaps, he was astonished, and failed to understand Muff's motive. In conversation with another agent the following evening, he remarked that Nemo was the "biggest fool" he (the agent) "ever struck." But was it foolishness, or was it that sturdy, self-possessed honesty which values an inward consciousness of truth more than any present gain in money?

Men who are morally weak never do such "foolish things" as that, and they cannot understand them. But this was quite in keeping with Muff's usual way of doing business.

About a year after Muff began the manufacture of paper pulp from poplar wood, there occurred one of those "depressions" which periodically afflict business in America. Old business men have come to look for them and to be on their guard, but the young men who are doing business are apt to fail.

Muff had never faced a business panic before, and it tried him sorely, not so much on account of his own errors, as those of other parties with whom he dealt. The great paper-making firm which he was then supplying became embarrassed and failed to pay for a large amount of pulp which it had received from Muff's mill. Worse still, the market was "flat", and Muff had a great stock of wood on hand and still more contracted for.

As he had only a small capital, he was seriously embarrassed. It would have been comparatively easy to fail, or at least stop work for a time in both mills, and let the stagnant market become relieved before resuming operations. But he was determined to keep

all his contracts if possible; and he disliked, too, to throw his help out of employment, for now a little settlement of operatives was clustered about his two factories.

He was absolutely obliged, however, to reduce their wages one-quarter. Being a young man of few words, he simply told his help that the depression in business would compel him to pay twenty-five per cent less in wages for six months or more, and made no further talk about it.

But this made trouble.

A manufacturer nearly always has a few enemies among his operatives. Muff had two, and these accused him of oppressing them unjustly, and from beginning to think evil of him themselves, they soon aroused so much ill-feeling among the workmen that obscure threats were made of burning the mills. About a week later the malcontents made a demonstration before the office in the spool factory one morning; and by way of expressing their discontent, one or two stones were thrown through the office window, to the accompaniment of certain doleful groans and cries.

Muff was inside. He came out at once, and stood face to face with the angry crowd.

"Well, what are you stoning me for? What do you want?" he demanded.

"We want justice. We want our wages. We won't stand this cutting down our pay. We'll burn your old mill down first!" were the cries in reply.

"You mean to say, then," replied Muff, slowly and distinctly, "that unless I pay you the same wages as I did last month, you will burn the mills?"

"Yes, we will. We will. We'll do it, too!" were the defiant responses.

"All right!" replied Muff, calmly, "You can do so—on your own responsibility."

He added: "The mills are insured. I am going over to the post office (half a mile), and shall be gone an hour. You will have plenty of time—and plenty of time after they are burned, for I shall not rebuild them this year."

He started off, but turned to say, "I am borrowing money this morning to give you such wages as I am paying. If you don't want it, all right."

He walked off briskly, leaving them in full possession.

Many of these folks were ignorant,

The Amateur Poet's Corner

Because of the number of contributions, we do not return poems not published. Keep a copy of your poem.

The limit in length is sixteen (16) lines and poem must be original and written by an amateur. \$2.00 will be paid to the author of each one printed. Check will be mailed on or about first day of month following publication.

The Blues

Don't try to cheer me up today,
It won't be worth your while.
Today's my day for feeling blue,
Don't try to make me smile.

There's not a thing to smile about,
Life's just a bitter pill;
I licked the sugar coating off,
And now I'm feeling ill.

Don't try to cheer me up today,
Just leave me to my sorrow;
Today's my day for feeling blue,
I'll smile again — tomorrow.

—Mrs. H. B. Slocum,
c/o Mrs. Ella Z. Slocum,
Anglica, N. Y.

too ignorant to understand the real facts of the case as regarded business, but their native common sense began to assert itself, and they thought better of their threats.

When Muff came back, he found both mills running as usual, and every hand at work. That was the last he heard of his "strike", and he managed to continue the business without breach of a single contract with anyone.

One day, as Muff was measuring a lot of poplar wood, recently delivered to him in the factory yard, a somewhat grand equipage drove up, and a gentleman with long hair which fell upon his shoulders in patriarchal fashion, gravely solicited his attention.

"Of course you have heard of me, Mr. Nemo," remarked the patriarchal personage; "I am the well-known Dr. Haddinger, and I have taken the liberty to call on you in relation to a matter which I think is of some interest to you. May I request a private interview?"

Muff had never heard of the doctor; but he asked him into the office and shut the door.

His visitor then spoke as follows:

"Through certain channels of information to which the medical profession have access I hear that you have a 'birth-mark', as it is called, of an unfortunate, or at least disagreeable character—one I presume you would be glad to get rid of."

Having thus broached the subject, the doctor then proceeded with suitable preliminaries to disclose his object in calling, which was to remove, by a certain peculiar treatment and for a certain not very unreasonable sum, the said mark from around Muff's neck.

Muff heard him through carefully and even drew him out a little as to his methods, then said:—

"I remember a day, doctor, when I would have given everything I possessed on earth willingly to be rid of that red mark. But my sentiments touching it have undergone a radical change. I don't know how I came by it. But it is there for better or worse. I shall always wear it. To tell you the truth, I now cherish it as a reminder of certain grave mistakes which I once made, and also as a kind of talisman for certain resolutions which I made afterwards. Doctor, I am not jesting, but merely stating a fact, when I say that I would not part company with that mark for a thousand dollars!"

Somewhat disappointed, the doctor took leave immediately.

(To be concluded next issue)

The Song of the Lazy Farmer

THIS YEAR on Independence Day, I'm mighty glad I needn't say "Heil Hitler," or goose-step, by jing, for any potentate or king. There ain't no dictator can tell me when I have to cheer or yell, and if I want to boo and stamp there ain't no concentration camp to put me in, no Gestapo can tell me when to come and go. There ain't no place I'd rather be, than here in this land of the free; a man can call his mind his own, nor do his talk-in' in a tone that's half a whisper cause he fears that it will reach official ears.

If we don't like the government or want some other president, we're free to say so anywhere: if politics get in our hair and we don't like the things they do, we speak right up and tell 'em to heed our opinions or they'll note the way we'll swat 'em with our vote. We sit around the barber shop and call the governor a flop, or else we set out one by one the things the president should do, to get us out of this here mess, there ain't a single thing.

I guess, that we don't settle, we know how the nation should be managed now. Life surely wouldn't seem so bright, a-sittin' with our mouth closed tight, afraid to say a word, or think, for fear that some officious gink would tattle to the Fuhrer so that off to concentration camp we'd go. So three cheers for the U. S. A., where ev'ry feller has his say!

"Swim the Deep River"

(Continued from Page 1)

note understanding and consideration fall on deafened ears. The social situation in these respects is deteriorating at a rate that is truly alarming. After all, hatred is a poison which no body politic can long withstand. In human relations there is no substitute for good-will. Social progress is to be achieved through negotiation and peace, not through exploitation and war. The perplexities of these troubled times are only to be resolved by men and women of unflinching humanitarianism who work with sympathy and understanding to establish justice, to insure tranquility, to promote the general welfare, and to secure to themselves and posterity the blessings of their hard-won liberty. May you members of the Class of 1939 never fail to exhibit that understanding and good-will of which our times are so desperately in need.

In one other direction, the present social situation carries implications for individual character that should be recognized. In matters of ethics and morals we are more nearly on our individual own than ever before. In consequence, individual integrity grows in importance. We sorely need more men

Sorrow

By Edith Horton.

Death came to the house of my friend,
I went to her and wept,
Not as she wept,
But for all sorrow.

and women whose word is as good as their bond; whose honor is high above suspicion. Edmund Burke once observed that he knew no way of indicting a whole people. Neither is there known any way of policing a whole people. All any government can undertake to do is to police the few who respect no authority not backed by force. The system works because the great majority obey the dictates of their individual consciences. Self-imposed responsibility is what holds any effectively-free society together. We need more of that type of responsibility in our present social situation. The kind of personal integrity that sets its own high standards of right and worthy conduct, that enforces its own exacting rules and regulations, that places its own conscience in continuing judgment over the inevitable mistakes and failures of life, this kind of personal integrity is needed today as never before. Let not the vicissitudes of life lead you into that irreparable betrayal which consists of a betrayal of your own better selves. Whatever the measure of success that you may individually achieve, may you members of the Class of 1939, each and every one of you, develop that personal integrity and self-imposed responsibility which lie at the very foundation of every orderly and progressive society.

There is no mistaking the fact that

"We didn't have enough lumber for a diving platform!"

we face today many grave social problems. Of these I have not attempted to speak. Instead I have tried to bring to your attention some of the implications of our social distress for your own innermost living. Abiding happiness in life lies in qualities of mind and character. Social reform, whatever its range and promise, will never achieve the hoped-for results if it fails to establish the moral and spiritual bases for life together, in justice and in peace.

Cephus in the City

(Continued from Page 5)

everything but a manicure. Then they'd fasten the machine to her, and when she came off the other side she was all milked. All the men that handled her were inoculated and vaccinated, inspected by doctors every day, and wore sterilized clothes. I couldn't help but think how foolish Old Sal would feel with all this fuss. Of course the cows they had there were used to being pampered. They were champions from 33 states and four provinces of Canada; and mighty fine looking even if they were stuck-up!

The Fair had something that was mighty popular with the city folks who have been denied its joys, but it's something that you have had out in Hog Hollow for years. They had people making telephone calls and it was fixed so a couple of hundred people could listen in, and they were fighting over those receivers just like Aunt Emma and Aunt Hep used to until they had that other phone put in.

I saw part of a baseball game in one of those new television sets that lets you see what you're hearing over the radio. And it came over pretty good, but I don't think it will keep people out of the ball parks. You've got to consider the human element. I can't picture Uncle Zeke sitting in front of a radio set yelling names at the umpire.

They had a mechanical man at the Fair that moved when somebody told him to and smoked and talked and obeyed every command, but he couldn't do anything for himself. I couldn't help but look on him as a warning of what the man of tomorrow will be like if we don't keep on our toes and stop the government from regimenting all of us.

Write soon, Ma.

Your loving son,
Cephus.

Grange Gleanings

From Possibility to Certainty

There's always a chance your earnings will be cut off. Will your family suffer? Have you provided for their future? Adequate protection is the surest way to safeguard their future. Your local Farmers and Traders representative will be glad to help you decide on a plan best suited to your needs. See him—or write us for booklet outlining our many policies.

FARMERS & TRADERS LIFE INSURANCE CO.
DEPT. A-7.
STATE TOWER BLDG. SYRACUSE, N. Y.

By pasting a couple of snapshots together we built the above picture which gives a pretty good idea of the Guernsey heifers we are pasturing on Coy Glen farm. With twenty-two heifers due to freshen in October, the hour when we must decide whether or not to go back to milking cows will soon be upon

us. In the two years we have been growing these heifers we have been able to handle them so that they always moved forward in both growth and condition until the last two weeks, when a combination of drought, hot weather, and flies has distinctly set them back.

Kernels, Screenings and Chaff

By H. E. BABCOCK

FOR MONTHS now my mail has contained a plentiful sprinkling of literature about the World's Poultry Congress which is scheduled for Cleveland during the period from July 28 to August 7.

The fact that I have been receiving this mail and that every other poultryman who reads this page has been made aware of the Congress all stems back to the almost superhuman enthusiasm and energy which a single individual has poured into its promotion.

Of course, you all know to whom I refer—the General Chairman of the Congress, Professor of Poultry Husbandry Emeritus at Cornell University, James E. Rice.

A FITTING TRIBUTE

To my mind, the holding of the Congress in the United States at this time takes on special significance.

First, it is the rallying point for a great industry which because of its economic plight badly needs leadership and program at this time. Second, it automatically becomes, despite its world-wide significance, a personal recognition of the lifetime, unselfish services and spirited leadership of perhaps the greatest figure in the poultry industry, "Jimmy" Rice.

YOUR SUPPORT NEEDED

Nothing will round out the Congress like the support of the great Empire State of New York, Jimmy's home state. In the whirlwind campaign which Professor Rice is conducting to secure for the Congress the final sup-

port which will guarantee its success, we home folks must not let him down. (EDITOR'S NOTE: Buy a \$1.00 ticket, even if you cannot attend the Congress. It's an investment that will pay dividends).

Entirely apart from sentiment, the Congress itself furnishes us poultrymen with our chief hope for that leadership which will do something toward making the general public more conscious of the food value and cheapness of poultry products and thus do something to offset the inroads which are being made in egg and poultry consumption by industries which are more aggressively marketing their products.

* * *

Silage Notes

This is being written on June 29th. If it does not rain before nightfall, we will get through haying at SunnYGables today. Usually we aim to be through on the fourth of July but very seldom have we made it.

This year's rapid progress has been accounted for by a somewhat lighter stand of hay (although it was better than we thought it was when we got into it); by a long period of hot rainless days which have dried up the country to the point where nothing is growing; and by filling a 14 by 40 foot silo full of grass ensilage. With our gravity dump truck and the way we handle our chopping, we can really handle green hay faster than we can dry, especially when we store the dry hay without chopping it.

The green hay we chopped for silage at SunnYGables was cut off a piece of new seeding. It contained from ten to thirty per cent by weight of volunteer winter barley and wheat. It also con-

tained a considerable percentage, perhaps another third, of timothy. We set up our chopping rig so as to drip 68% phosphoric acid on this green hay as it went through the chopper. However, only in the case of a very few loads of hay which appeared to be practically pure clover and alfalfa did we drip on the recommended five quarts to the ton of phosphoric acid.

On all the rest of the stuff we chopped we cut the acid stream down from a maximum of five quarts to the ton to as low as one quart to the ton. We determined the amount of acid we used by the proportion of timothy and winter barley and wheat which was in the hay we were chopping. By thus economizing we cut the recommended amount of acid in half and saved that much cash outlay.

I am setting down what we have done for this reason. Four years practical experience has absolutely convinced me of the economic importance of grass silage in the northeast. At the present farm price level, however, northeastern farmers certainly can not take on any more cash expense. Up to date, it has been necessary to make a substantial cash outlay for either molasses or phosphoric acid in order to make good silage out of legumes, like clover, alfalfa and soybeans. What I am interested in doing is cutting this cash outlay to the very minimum.

I'm sure, because one of my neighbors did it very successfully last year, that I can make good soybean ensilage in the fall by growing some corn to mix in with the soybeans and perhaps supplementing the mixture with a little acid or molasses.

Corn isn't available, however, when grass silage has to be made, except of course for fall cuttings of second growth. At SunnYGables, however, winter barley appears to be in the dough state, when clover and alfalfa should be cut for silage, and wheat in the milk stage.

We, therefore, are laying our plans to have winter barley and wheat to mix into our grass silage in June, 1940, with the idea of keeping our purchase of phosphoric acid down to a minimum, unless, as may be the case, we find that we have gotten into a mess with the silage we have just finished. If we have, I'll so report in due time.

It might be well, for the sake of the record, also to record here that at

Larchmont we have filled a 14 foot silo with a clear stand of timothy to which we added no dope whatsoever.

* * *

Weed Control

I've already reported on the fact that by using two different methods, both cheap enough to be practical, we have secured this season in a field of barley what appears to be practically one hundred per cent mustard control.

I am now going to allow the weeds to come up on a twenty acre field of sod which has been plowed for fall grain, and when I have a good stand check the results I appeared to get this spring. The two methods I am using are dusting and a wet spray.

In the meantime, I have a very interesting letter from W. E. Washbon, the manager of the Schuyler County Farm Bureau, concerning the effectiveness of grass silage in controlling the spread of weeds. He says: "When I was an undergraduate in the College of Agriculture about five years ago, I carried on an experiment on the killing of weed seed which had gone through a silo. We used twenty-two different kinds of weed seeds, which included quack grass, mustard, thistle, cinquefoil, yellow rocket, and a number of others. Samples of each weed seed were germinated to determine what the percentage of germination was before going into the silo. I counted 72,000 weed seeds in this experiment and then divided them into lots. They were then placed in three silos located in different parts of the state and were placed in the silo in a number of different positions relative to vertical and horizontal positions. The period of ensiling ranged from about 58 days to over 180. Of all the weed seeds which we placed in the silo, only one species seemed to be able to withstand the treatment, that being the *Abutilon* *Tephrostrati*, commonly known as velvet leaf or butter print. It germinated equally well and in some cases better after being ensiled for that period. Of the other 21 kinds which represented over 65,000 seeds, only one or two seeds germinated. Because it is commonly thought that quack grass and mustard are spread through silage, we put in extra lots of mustard and quack grass seeds in numbers exceeding a million each, and of them not one seed germinated."

Notes

*Sign a note and lose a friend,
That's a universal trend.*

In one sense a note is not a particularly valuable piece of paper. It is different than a protested check in that failure to meet a note when due is not considered a criminal act. The holder of the note must sue and get a judgment. If the man who made the note has no property, the judgment may be no more valuable than the note itself.

There is, however, another side to the question of giving notes which readers should watch. If you do have property and give a note to a man—say in payment for equipment you have bought, and with the understanding that you are to pay on the installment plan—he may sell the note to a third party. Then in case you do not pay your installments promptly, this third party can legally come back at you and demand immediate payment of the entire amount.

The fact that the merchandise you purchase may not be satisfactory has no bearing in the eyes of the law as the holder of the note is supposed to be an innocent-third party and, if he takes the matter to court, is almost certain to get a judgment against you. Then if you are not satisfied with the treatment received from the man you originally had the deal with, your only redress is to bring suit against him. It is well to keep that in mind when you give a note.

By the way, many smart business men have a hard and fast rule never to act as a co-signer of a note as an accommodation. If you must be neighborly loan your friend the money and, for protection, get a chattel mortgage on something of value.

* * *

Collector Got 95%

"I gave twenty accounts to a collection agency. They collected \$40.13 and I got a check for \$2.07. The accounting showed 50% deduction for commission, and \$18., the minimum charge on 18 accounts they did not collect."

This is the common experience of our subscribers who turn over accounts for collection to out-of-town collection agencies. According to the contract they charge a listing fee for accounts not collected which usually figures out so that the subscriber gets little or nothing. It's quite legal and according to the contract!

* * *

Read the Guarantee

"Our guarantee only lasts ten days and only covers the chicks when properly brooded and cared for. There are many things that can happen to chicks for which we cannot be responsible and over which we have no control."

The above statement is contained in a letter from a baby chick hatchery which, by the way, is not an advertiser in *American Agriculturist*.

It is true that a hatchery cannot be blamed for all of the chicks that die, but it seems to us that the above guarantee leaves plenty of loop-holes. It is important to read and understand any guarantee made by a baby chick hatchery. We feel, also, that trouble is avoided by patronizing firms whose ads appear in publications that guarantee their advertisers.

* * *

Won't Return Commission

"If the goods are not worn, the subscriber may return them and we will return his money. The deposit will have to be returned by the salesperson."

The above letter from a concern that sells from house to house is fair and square and we are publishing it only to point out one fact. If goods purchased this way are not satisfac-

tory, the company will not return the deposit given to the agent, and it may be impossible to persuade the agent to do so. The usual practice in house to house selling is that the deposit is the agent's commission, and the company gets only the money sent directly to it.

* * *

No Pay for Timber

"I sold some timber to a man who cut and sold it but did not pay me at the time. The agreement with him was verbal. I have been to his place several times but he was not at home, and I have been unable to get my pay."

This is typical of a number of letters we have received recently and indicates the necessity of cash in selling timber. In the first place, we believe a written contract stating the rights and obligations of each party is advisable. Secondly, why not investigate the finances of the buyer before you consider the deal? If he owns no property and has a few judgments filed against him, the chances of collecting after the timber is sold are problematical. In such a situation, the safe thing to do is to demand at least part of the pay before the timber is taken off the farm.

* * *

Resale

"I would like some information regarding a correspondence school in Dorchester, Massachusetts, called the General Training Institute. A Mr. Richmond came to me and said he was field man for that school and had my name recommended by a local minister. Before he left we found he was the only person connected with the school, and that this school was in his home. His line was training for civil service jobs and he claimed he bought his course from the Pergande Institute. His fee was \$70 and he insisted that I sign up then or never. Naturally I did no business with him but I was wondering if he is crooked."

The Pergande Publishing Company states that Mr. Richmond is in no way connected with the organization, but merely purchases study material from them for resale purposes.

* * *

"I wish to thank you for I know he would not have made any settlement if you had not written to him. This is the third time the *American Agriculturist* has helped me get a settlement. One was for \$275. for hay; another on cabbage plants of about \$30., so I say the man who does not take *American Agriculturist* is soft in the head."—T. E. W., New York.

* * *

Holding Fur

"I shipped some furs and was not satisfied with the returns so asked to have them shipped back. The company replied that the furs had not been kept separate."

If you want furs kept separate until you accept the price offered, you should state that specifically in a letter when making the shipment. Most companies are glad to do this upon request, but don't do so unless asked.

* * *

A Lewis County, N. Y., reader would like to learn experiences of dairymen who have built home-made silos from hemlock timber. He is planning to build a silo next fall and has quite a bit of hemlock growing on his place.

We will gladly forward letters to him.

* * *

We would be glad to have information that would help in locating Mr. M. B. Hawes, recently of Bridgewater Corners, Vermont, and North Walpole, New Hampshire. If you know where Mr. Hawes is living at present, we would appreciate your dropping a line to the Service Bureau.

Mr. and Mrs. James Dundas, Dexter, Maine.

"IT WAS very fortunate for us," writes Mr. Dundas, "that we had the policy to help us following our unfortunate accident when the bus collided with our car. (See picture below). We were both laid up for 12 weeks and each of us received \$120.00. Everyone who rides in a car should have North American Protection."

What it takes..

TO MAKE PULLETS LIKE THIS INTO LAYERS

Like this

The pullet at the top is 12 weeks old. The one below is 24 weeks—just getting into her stride as an egg producer.

The difference between the two is 16 pounds of feed—8 of mash and 8 of grain. Total feed cost for the 12-week period will be about 28 cents if Starting & Growing Mash is fed; 27 cents if the feed is Growing Mash.

The principal difference between the two feeds is *milk*. For one cent per pullet additional,

Starting & Growing Mash provides each bird with the equivalent of six pounds of liquid milk products. This means an extra supply of the "growth" Vitamin G, an increase in animal protein, and more minerals.

Lots of good layers have been raised on Growing Mash for the second half of the growing period. But most poultrymen feel that the extra margin of safety provided by Starting & Growing Mash is well worth

the slight difference in cost.

As one man expressed it, "I'm interested in raising the best possible birds. I want to get plenty of size on them, and put them in the laying house in good health and good flesh. It would take only about one egg the first year to make up the difference in cost between Start & Grow and the cheapest mash I could buy. That's why I keep my pullets on Starting & Growing Mash right through."

NEW SUPER UNICO TIRE GIVES EXTRA TRACTION

This farmer is carrying the new Super Unico tire with the deep non skid tread. On smooth highways which become slippery with rain, the saw-toothed ribs of the Super Unico keep the tire in constant grip with the road and offer a broader traction surface.

On dirt and muddy roads the best tire is the Standard Unico with its open tread which grips better on rough surfaces. Standard Unicos cost 10% less.

BINDER TWINE THAT DOESN'T CAVE IN

Ever have a ball of binder twine collapse when you got near the outside layers, causing it to snarl and break? G.L.F. binder twine doesn't do that. It's wound in a new way so that it stands up right to the very end. It's tough and strong, and very uniform in thickness with a minimum of thick and thin spots. All G.L.F. Service Agencies carry it.

HOW WOULD YOU FEED THESE COWS?

The picture below shows part of a string of 10 cows. In this string there are four very high producers which are on test. Four others are pretty good milkers. Two are dry. They are on fair pasture and are getting hay which contains some clover.

Here is one way of feeding them:

ALL COWS.....Exchange Dairy 20%

Here is another way:

TEST COWS...

... Super Exchange Dairy 20%

FAIR MILKERS.....20% Cow Feed

DRY COWS.....Fitting Ration 13%

Production from the test cows is worth more than just the cash returns from the milk. High records increase the value of the cows and of their offspring. Therefore it is a good plan to feed them a fixed formula feed such as Super Exchange, very

high in quality of ingredients and in digestible nutrients, with a minimum of 4½% fat, in order to get every possible pound of milk and butterfat and keep them in top condition.

In feeding the fairly good milkers, digestible feed at low cost is the main problem. 20% Cow Feed provides 100 lbs. of total digestible nutrients for about \$2.00, which is slightly less than Exchange Dairy. It is a good, well-balanced feed, averaging close to 4% fat. For average cows on the average farm, at present milk prices, 20% Cow Feed is an excellent buy.

The dry cows do not need as much protein as the milkers, so they can very well be fed Fitting Ration. However Fitting Ration is more expensive than 20% Cow Feed, and the extra protein will do no harm. It would be more economical to

give the dry cows 20% Cow Feed or even 18% Cow Feed which costs about \$2.10 a ton less.

A simple feed cart with two or three compartments, such as

that shown in the picture below, makes it easy to feed cows according to their individual needs—getting the most out of the cows and out of the money you spend for feed.

AMERICAN AGRICULTURIST

FIVE YEARS FOR \$3.00 — THREE YEARS FOR \$2.00 — PUBLISHED EVERY OTHER WEEK

I Go To Church in Penn-Dutchland

View of a neighboring church shed on the same Sunday morning. This church is near the other, but it is of one of the more primitive sects who do not believe in automobiles. There were about 120 buggies—every one exactly like every other—under three unbelievably long sheds. These people are known locally as "Wagon-enders."

(Left) View of the Mennonite Church in Lancaster County.

I HAVE WRITTEN how on a Saturday afternoon I attended an auction sale and saw a farm sold for a per acre price that was entirely beyond my experience or even my thinking and the next Sunday morning I went to church with the same people. I went to church because this is my invariable habit and more specifically because in any community the church is perhaps the one most significant institution.

The service I selected was at the Mennonite Church not far from the hamlet of Beartown and in the general vicinity of two villages which bear the delightful names respectively of Bird-in-Hand and Blue Ball—designations, I understand, which owe their inception to the devices painted on ancient roadside tavern signs. The church in question is not in any village or even on what may be called a main line road. It stands right out in what we properly designate the open country and might be called almost lonely for situation. It is set in the midst of a venerable oak grove and I am told that it is the third edifice which has occupied this same site during the last two hundred years. The building is large—almost unbelievably large for a country church and is relatively new, having been built in 1926. Built of fine pressed brick and excellent material and having neither bell nor steeple, it is as plain and dignified and substantial as the folk

By Jared Van Wagenen, Jr.

who worship there. Inside, the auditorium is as simple and unadorned as is the building without, save only one concession to extreme modernity. On the preaching desk stands a microphone and on either side high up is an amplifier or loud-speaker—a device very convenient for one who must make his voice heard in the furthest corner of that big room.

It was the first day of October and a singularly beautiful autumn morning. We drove in very leisurely fashion the dozen or so miles from Ephratah where we had lain the night and arrived a little early for the service—primarily, I suppose, because for once I had had no part in milking or feeding the cows and none of that array of chores which makes the dairy farm such a desperately busy place of a Sunday morning. To one of the early comers I explained that I was a New York farmer who had come especially to see the Pennsylvania farmer on his land and in his home and at his church. The beaming kindness and sincerity of his welcome was of a sort to make a man feel that he had indeed come among friends. The auditorium has the somewhat unusual arrangement of two entrance doors—one on each side of the pulpit—a plan that is pretty hard on those unfortun-

nates who are late because their delinquency is held up before all the congregation.

I had a choice seat near the front and within a few moments the first thin trickle of arrivals grew into a constant stream that flowed through the doors and sought their accustomed places. Against the walls of the big vestibule were hundreds of hooks, and each worshiper as he entered hung up his black, round, low-crowned felt hat, every one of which to my untrained eye was precisely like its neighbor. I found myself in a state of amused wonder as to whether every man retrieved his own individual hat or whether being all exactly alike it just didn't matter which one he took when he went out. In like manner every woman hung up her black bonnet which being taken off revealed a little white lace head dress, which I believe is worn always in public and even in the home if strangers or guests are present.

I am told that this great church seats more than a thousand worshippers in the pews and presently I noticed that chairs were being placed in the aisles to accommodate the overflow. Before I came I had been warned that there would be more babies than I had ever seen at one time before in my life and this prediction was fully realized. It seemed to me that literally almost every young woman bore in her arms what somebody has called a "bud of promise". I especially remember counting five young wives who, going up the aisle one behind the other, made a little procession and each with her babe. The scene brought to my mind those lines from Joaquin Miller, the "good gray poet" of California:

*"The queenliest woman, bravest, best,
Beneath our starry flag is she
Who loves her spouse most ardently
And rocks the cradle oftenest,
Who rocks and sings and rocks and when
The birds are nesting rocks again."*

Unfortunately I am unable to testify that every last one of this (Turn to Page 20)

New Law Stops Loophole in New York Law on Trespassing—See Page 6.

Better Footing Now...

but watch for traps!

YES, the decision of the Supreme Court has given farmers a more certain footing. **BUT** the road ahead is not smooth. Already the same old Anti-farm Gang is at work. They are now seeking ways to defeat the effectiveness of the order.

Today, with farmers united, the same dealers are saying, "We're for the order **BUT**. There are injustices involved. Let's correct this. Let's correct that."

If they had their way, there would be little of the order left.

This same group of dealers are seeking their own selfish advantage. So let's all be on our guard against proposed changes which would make it more difficult for farmers to get **A LIVING PRICE FOR THEIR MILK**.

**Published by the Thousands of Farmers Who Own, Operate and
Control The Dairymen's League**

Wins Trip to Poultry Congress

On June 10 at Ithaca, N. Y., HARLAND CHIDSEY, a 4-H Club member of Penn Yan, N. Y., won a trip to the World's Poultry Congress at Cleveland. With his model, made to scale, he showed how to construct a 20 x 20 laying house. His talk was not based on theory because he has actually built a full-sized house for the flock which he is raising as a 4-H project. At Cleveland he will compete with Club members from all over the country for the title of National Champion and a substantial prize.

What Would You Do?

(Above)—Covering trees with lime-sulphur in the Wilson and Jones orchard at Hall, N. Y. The other day when I was walking through this orchard with MR. CHARLES WILSON, he raised an interesting question about their McIntosh orchard (which we later visited) where originally fillers (also McIntosh) had been planted. In several rows the fillers had been cut out; in a few rows where they had been allowed to remain, the trees were noticeably crowded. Said Mr. Wilson:

"It is easy to agree on the theoretical proposition that the fillers should be cut out. However, every time we come to pick the crop, we find that the rows where the fillers are give more bushels of apples than the rows where the fillers have been cut out. Neither can we see any difference in the quality.

"Added to the question of yield is the fact that ice storms and other unfavorable weather conditions seem to do less damage in the rows where the fillers have been allowed to remain. Every year I look the situation over, and every year so far I have decided to leave the fillers one more year."

Mr. Wilson asked me what I would do if I were in his place, and I was forced to admit that I probably would reach the same conclusion.

Perhaps some of our readers have had a similar problem to solve. If so, we would be interested to know how they handled it.—H. L. Cosline.

Thorough Spraying Grew More Potatoes

is the result of a test he made. A measured row sprayed once gave the three bushels at the left. A row of the same length sprayed five times yielded the five bushels at the right. In addition to the increase in yield, a higher percentage of the five bushels graded as U. S. No. 1's.

CARL EMERLING (right) of Boston, Erie County, N. Y., knows that spraying potatoes increases yield. Here

Tops Erie Co., N.Y., Hay Growers

PHILLIP F. KILLEEN (below) of Williamsville, N. Y., is Erie County's first hay king. This title of royalty was conferred upon him at a hay show which climaxed the Erie County Farm Bureau's annual dairy feeding school last winter. King Phillip I. is shown here with his hay fork sceptre and the sweepstakes cup which was his award.

Oxen Can Still "Take It" Oxen, once so common on rugged Connecticut farms, are now something of a rarity. The cut shows a yoke of high bred Devon steers owned by BENJAMIN E. HARWOOD, prominent gentleman farmer of Chester, Conn.

He Knew the Answer 100 Years Ago!

DR. V. B. HART, Cornell Extension Professor in Farm Management, has given me a very interesting paragraph about gold and prices written by an English Gentleman of Fortune in 1850. The book from which the quotation is taken was awarded a prize of 1000 pounds by a London Literary Society as being the best account of the California gold strike. Here is what the writer said about gold:

"Whenever there was a big strike made in an isolated camp and there was a lot of 'dust' available, prices immediately went up. When a large amount of gold was being taken out, prices of a pair of boots frequently went from \$3.00 to \$50.00 and picks and shovels jumped from \$2.00 to \$25.00. Then when the workings played out and there was little gold around, prices dropped again."

In the same book the English writer said he wondered if there were not a very definite relationship between prices and the amount of gold available in the form of money. There is!

It seems strange that a sensible man cannot see that gold is only a commodity, subject to the law of supply and demand like any other commodity, and that, therefore, prices based on gold will jump around as the amount of gold increases or diminishes. This fact more than any other causes hard times.

The remedy, of course, is to base the value of the dollar on several commodities instead of on the single commodity, gold. Then the purchasing value of the dollar would not vary very much. When we get all through with all kinds of schemes to pull us out of these hard times, it will seem that all of them put together have done little toward raising the general price level compared with the single act of making the dollar an honest, constant, unvarying measuring stick of value.

Neighbors Did the Haying

MY BROTHER, George Duff, was taken very ill just before haying. Helpless in bed, like any other farmer he started to worry about getting his haying done.

Among his neighbors is a former Russian soldier, Mr. Konrad Kozonosky, who is educated in his own language but has considerable difficulty with ours. A stranger in a strange land, Mr. Kozonosky became acquainted with my brother, and they found much in common in discussing some of the stirring old events of Russian history. He knew that worrying about the haying was delaying George Duff's recovery, so one afternoon he and several of the neighbors appeared with mowing machines and in a short time cut all of the hay. Next afternoon the neighbors all came back and put the hay in the barn.

I doubt if there is a farm neighborhood in this old northeastern country of ours where something like this has not happened many times. Webster defines neighbor as "one regarded as a fellow being, and hence entitled to receive and expected to render kindness." Country people on the farms and in the villages live up to the definition and to that ideal. A neighborhood is much like one large family. To be sure, we gossip a little once in a while, and occasionally find fault with our neighbors' shortcomings, just as members of a family do. But let trouble come, and the neighbors always rally around. That is my idea of practical, everyday religion.

In order publicly to emphasize the kindness of my brother's neighbors, and through them good neighbors everywhere, I am citing the names of those who left their own work to help a brother farmer in his trouble:

Konrad Kozonosky, former Sergeant Russian

Imperial Police, Russia, Siberia, Vladivostok; Enos Vanderpool, former corporal Company A, 166th Regiment, Rainbow Division, A. E. F.; Stephen Shaff, Tony Kozonosky, Earl Harvey and sons, Luke Winship, John Walker, Henry Clark, Henry Sharp, Leon Pickett, Carl Klossner, Mr. Uniker and family, Homer Justice, Frank Nurkoski and son, William Smith, and Carl Rice.

Beef Cattle on the Vermont Hills

IN THE grand old state of Vermont, two gentlemen, Messrs. Murdock and Burnham, have embarked on a program to produce beef cattle on a large scale. In the town of Shoreham, on the shores of Lake Champlain, they purchased a 1500 acre cattle ranch, put up 22 miles of wire fences, constructed corrals, silos, and two 600-foot long feed sheds, and brought in 600 Hereford cattle. About 1100 of the 1500 acres will be used for pasture, the other 400 will be in meadow and silage.

Everyone interested in the welfare of northeastern agriculture would like to see this project succeed. If it can be demonstrated that beef cattle can be made a profitable enterprise in the hills and valleys of our northeastern farm country, it will make a substitute for the dairy business, cut down the surplus of milk, and give farmers another source of income.

But those familiar with the economic facts of producing beef cattle are skeptical. They do not believe it can be done here on a large scale. For one thing, most of those who try such projects make the mistake of getting over-capitalized. They do things too well. Profits are so close in such enterprises that any extra expense throws the business on the wrong side of the ledger. Such projects often go along well in periods of high prices, and then lose when prices go down.

On the other hand, there are several good farmers in the Northeast who are making some money on beef on a small scale. One New England farmer has kept about 40 head on his farm for many years, but he does not depend on beef cattle alone and has several other sources of farm income. Asked how he does it, he answers in one sentence, "I keep expenses down."

Famous Trees

New Jersey's Largest Tree.

AN ENORMOUS white oak on a soil conservation demonstration farm between Chesterfield and Jacobstown in Burlington county, New Jersey, has the largest girth of any tree known in the Garden State. The trunk measures almost 25 feet around.

Mr. Thomas Harrison is the present owner of the farm. His father, Mr. Richard Harrison, measured the tree in 1911 and found that its cir-

cumference was 21 feet, 2 inches. Photo by courtesy of the U. S. Soil Conservation Service.

Sweet Corn on July 8

MY FRIEND, Bruce Millard, farming in the Inlet Valley at Ithaca, had fine sweet corn on his table on Saturday, July 8, and a few days later had plenty of it for sale at his roadstand. Who, in this same latitude or farther north, can beat that record?

The variety of this earliest corn was Seneca 60, which is about a week earlier than Golden Cross. Bruce says that he believes that the quality of a little later variety is better.

Romeyn Berry, one of the *A. A.* staff, is bragging around about having had new potatoes and peas on the Fourth of July. Well, that's no record for peas, but it is pretty good for potatoes, providing the potatoes are bigger than hickory nuts. I bet Rym's were not.

A few years ago at my place at Dryden, which is not quite as warm as Bruce's, I had sweet corn on the 17th of July. I bragged about it some, with the result that I got about a hundred letters from friends all over the Northeast who said they were going to beat that record, and I guess some of them did the next year. To get this early corn I used hot caps. Bruce tells me that he did so this year, and they made a difference of about three days in maturing corn.

Such small things add to the joy of living!

An Interesting Contest

YOU WILL be interested in the Weyerhaeuser Contest described in our department "With American Agriculturist Advertisers" on page 16 of this issue. Substantial cash prizes have been given to the winners of this month's contest, and new prizes offered for the next one. Our readers seem to be as much interested in both editorial and advertisers' contests as they are in anything else in the paper.

Eastman's Chestnut

THERE are so many stories told on the hired man that I thought it no more than fair to turn the tables and give the hired man a chance. So I have been getting some good ones on the boss. The following story was sent in by Mr. Paul B. Jennings of Towanda, Pennsylvania. Mr. Jennings writes:

"I enclose one that was sent to my father about 25 years ago. I do not know the writer." Here it is:

FROM BEHIND THE BARN

He owns the place, and I'm his Farmer;
He says "My Man" does Squire Palmer.
And seems to think he runs the Farm;
But that don't do a mite of harm.
Fer he can think or else forgit it,
So long as him and me can hit it.
I buy the stuff, an rigs and hosses;
He pays the bills and stands the losses.
I do the plantin' as I please,
An' foller out my own idees.
An' he don't talk, not in my hearin'—
Ner he don't do no interferrin'.
I git my house an wood an water,
And all the stuff, just as I oughter;
I'm workin round the hull year through—
Got all the work that I kin do;
I git my livin' and a salary
While he's a-playin' to the Gallery.
He comes around when things is growin',
An brings his friends to hear his blowin'.
An' shows em all around the place,
An' prances 'till he busts a trace.
He gits his pay—An' that's the story,
Fresh air and grub and lots of glory.

OUR READERS . . . Wrote this PAGE

Want to Laugh?

READ THIS LETTER

IF SOME time you'd like to see a really efficient job of manure spreading done, let the train do it. The farm machinery companies put out some neat spreaders, some with engines to do the work we used to do with a fork, a strong back, and much cussing. The railroad, however, has never advertised this service to the farmer, and now I should like to testify to its thoroughness and dispatch.

But the credit for the discovery of this extra-curricular activity of the railroad really goes to Bill, a former hired man of ours. In order that you may appreciate his discovery, I shall have to explain Bill, for his particular genius at such things is really the key to the whole situation.

Bill smashed every piece of machinery he touched. It was a gift. If he was plowing, he found every submerged rock in the lot, found it with the plow-point and to its sorrow. Harvesting corn one time, he smashed the harvester by hanging it high and dry on a plainly visible boulder. So anxious was he to mow a field of hay clean around the edges that he would try to cut the maple trees in the hedge row. It isn't recommended in the U. S. government bulletin on "The Care and Training of Cutter Bars" (No. 0.11, if you'd like a copy. Adv.). I firmly believe that if you set Bill loading a mountain of goosedown into rubber wagons with a steam shovel, he'd find something to wreck that steam shovel on.

The classic example of his destructiveness, however, was what I started to tell you about. He had a load of enrichment on the wagon ready to spread in the pasture across the railroad track. He left the horses and wagon standing about fifty feet this side of the track and went back into the barn to bed the cows. There was no witness to the actual event, but here is what must have happened:

The team stood patiently thinking whatever thoughts occupy the minds of waiting horses. Into their reverie there presently broke the sound of the milk train whistling for our crossing. Probably the horses set their cerebral chronometers by that train even as Helen sets the kitchen clock. At any rate, they realized that their day was out of step with the music because always when that whistle blew they were on the other side of the railroad. They decided to try to reach their accustomed place at this bar of the day's music, and started across. They very nearly—but not quite—made it. The step on the locomotive just clipped the rear of the wagon.

The Limited (limited to three cars and ten miles an hour) did not falter in its onrushing course. The wagon and its contents did not halt either, but rather violently changed direction. Horses and wagon parted company; wagon and enrichment likewise. The horses, tongue still between them, came to a halt in the orchard and paused to meditate as to why their efforts to restore the day's rhythm had failed. The enrichment rose to unexpected heights and spread itself lavishly. The garage on this side of the tracks, the tenant house on the other, both gates

and both fences were all ready to raise a bumper crop of corn if a liberal dressing of manure were all that was necessary. Bill had started his chores a little late, but he was all caught up now. At least, the manure was spread.

I repaired the wagon and laid low, expecting an adjuster to come and discuss settling the damages. Instead, one day the mail brought a letter from the "Dilly-Dally" billing us for \$37.07 for cleaning the engine and repairing the broken step on same. We figured the odd seven cents was probably for cleaning the engineer. Now, of course, it is a point of honor with any proper farmer never to knuckle down to the big and powerful interests of the railway trust. I knew that there was no legitimate way in which I could fight this bill as such, so I cast about in my mind for a genteel scheme for getting out of it. Blackmail or highway robbery was what I lit on.

Some years before this happened, the section gang had broken a couple of fine perfect flagstones in the stone steps that led from our lawn down to the track. At the time I had been plenty sore and had had a building contractor give me an estimate as to their value. He said he had to pay fifty dollars apiece for such stones. I had had some correspondence with the railroad in regard to the matter, but had finally cooled off and dropped it. Now I decided to pick it up again. I sent the company a bill for a hundred dollars for those stones, referred them to our previous correspondence, and assured them that, upon receipt of that sum, I would pay their bill of \$37.07.

A deep unbroken silence emanated from the office of the big transportation moguls, a silence which, on this particular subject, remains intact to

this day. Presumably they footed their own \$37.07 and cleaned up the engine (and the engineer?). As for us, we let nature's snow and rain restore the pristine beauty of our buildings, fired Bill, and bought us one of those spreaders with an engine to do the work. Not that we had any fault to find with the job the railroad did, but some of our fields are too far away to depend on that method.

—Gershom Gage.

Wishes

If I had a wish
I'd wish it this way:
I'd wish I could have
A wish every day.

I would wish for love
And I'd wish for wealth,
I'd wish for wisdom,
And I'd wish for health.

I'd wish the wishes
That would make folks glad,
I'd bring happiness
To folks who are sad.

I'd make the whole world
Feel happy and gay,
If only I could have
A wish every day.

EDITOR'S NOTE: This excellent little poem was written by Wilma Benson, R.F.D., Clinton, New York. In sending it in Wilma says:

"I am 14 years old and in the eighth grade. I have four sisters and one brother. We are poor and we would not pull through if we were not happy. I love the out-of-doors. I like to hike more than anything else, and I like to write poems."

No one could write a better piece of philosophy than that!

WHERE THE FLUID MILK BUSINESS BEGAN

HERE'S where all the trouble began. From this farm in 1842 went the first shipment of country milk for a city market. It was the beginning of the fluid milk industry, source of so much hope, disappointment and dissension among farmers ever since. The place is just outside the village of Chester, Orange County, N. Y., and is now the Summer home of Hervey J. Osborn, New York business man. Philo Gregory owned it in 1842, and William Langridge was his tenant farmer. Thaddeus Selleck, a contractor engaged on construction of the Erie railroad through Chester, became the first station agent at Chester, and it was he who induced Gregory to undertake the milk shipping experiment. The consignment, sixty quarts, went of course to New York City. Theretofore Orange County had been noted for its butter, but immediately the production of Goshen butter began to decline and Orange County's main industry since 1842 has been production of milk for the metropolitan market.

SAYS MILK SURPLUS LAW NEEDED

THERE are dairymen who have too many cows and are trying to make as much milk as they can, and this gives the surplus of milk. How can this be changed? There should be a law which says that every farmer can have to his farm so many cows, say 1 milk cow to 8 or 10 or 12 acres. Then you will find how quickly the surplus of milk will be gone.

The farmer can do something else. He can raise beef animals or raise grain for his cows and horses.

—W. B., New York.

EDITOR'S NOTE: The equalization plan is a surplus plan. The more milk dairymen produce, the less goes into Class I milk and the lower is the price. Something more is needed, however, so that every dairyman will see this point directly and will become "surplus conscious". Something in the way of a quota plan as suggested above may be needed, but it should be set up voluntarily by farmers themselves through their organizations and not by law.

A. A. COOKING SCHOOL A SUCCESS

I JUST want to thank you for the beautiful diploma I received a few days ago for the *American Agriculturist* cooking school course. I assure you I am very proud of it and have framed it and hung it in my kitchen. Everyone admires it.

This course certainly has been one of the best features in the A. A. in all the time the paper has been in our family, which is nearly 20 years. However, we enjoy all the articles and news, particularly Eastman's Chestnut! You certainly have some good ones. We look forward to many more years of receiving the good old A. A.

—Miss V. L. I. S., Pennsylvania.

IN DEFENSE OF DRIED APPLES

EASTMAN'S Chestnut on Dried Apples encourages me to pass along this old recipe for dried apple cake, which is a great favorite in my family. It beats most modern fruit cakes and is better if kept a short time before using.

And, while I do not dry them on a string, a warming closet being quicker and cleaner, or have a bag always hanging in the pantry as our grandmothers did, I occasionally dry a few when apples are plentiful.

I will admit that Editor Eastman is undoubtedly right when it comes to apple sauce and pie.

Dried Apple Cake

3 cups dried apples 2 cups molasses

Put apples to soak over night, pour off water and run through chopper. Boil in molasses until tender. Cool. Add 1 cup sugar, 2 eggs, 1 cup shortening, 1 cup sour milk, 2 teaspoons soda, 1 teaspoon cloves, 1 teaspoon allspice, 1 tablespoon cinnamon, 4 cups flour, 1 pound raisins, all measurements level. Bake in two loaves in moderate oven (350°-375°) 45 to 60 minutes.

—F. M. S., N. Y.

WHAT BECAME OF HALSTEAD?

WE ALL think much of your paper, and I, coming from central New Hampshire, greatly appreciate the Stephens stories you have been running. Once I wrote Mr. Stephens and asked him, "What became of Halsted?" He answered at considerable length, and later wrote me that my letter had prompted him to write the serial you recently printed. He was a wonderful man. I never met him, but have several letters from him that I cherish.—Wm. H. Sanders, Bedford Farmers Club, Bedford Hills, N. Y.

The whirling head system is easily moved and can apply the equivalent of one inch of rain in two or three hours.

Rain Making on THIRSTY GROUND

By PAUL WORK

PART II.

EDITOR'S NOTE: This is a continuation of the discussion on "Rain Making on Thirsty Ground" which appeared on page 6 of the July 8 issue.

Whirling Head Irrigation:

The latest enthusiasm in the irrigation field is for the whirling head type of appliance. These installations are always portable, using 4 to 6 inch pipes which are made of light steel. They have slip joints, gasket lined, which are put together and taken apart simply by inserting the pipe in a coupling unit. In spite of the circular coverage of each nozzle, uniformity of watering is achieved by overlapping. Thus, a head may have a watering radius of 100 feet. Sprinklers are spaced at about 40 feet on the line and the lines are moved 50 feet at each change. So there is enough overlapping to insure fairly even distribution.

The whirling head system of irrigation offers the advantages of service for a large area with a minimum investment in equipment and rapid application of water. An inch of rain may be applied in 2 to 3 hours. H. R. Talmadge & Son of Riverhead figure that it requires an average increase per year of but 15 bushels per acre of potatoes to justify their investment in well, pump, main and distributing system. They are equipped to water 130 acres.

The whirling head type of irrigation seems to be gaining rapidly in both West and East.

An Engineering Job:

The planning of an irrigation system is, as far as equipment and installation are concerned, an engineering job. Figuring back from the amount of water to be applied to a given area at a given time, it is possible to calculate the sizes of mains that are required, the necessary water supply, and the required pumping capacity. Matters of this sort need to be worked out with considerable care. There are several kinds of pumps—some adapted for one situation and some for another. The engineers of the irrigation companies are generally capable and well informed. Also, the extension services of the agricultural colleges can be of material assistance. The Committee on Electricity in Relation to Agriculture in Chicago has issued a most valuable booklet giving tables and full discussion of the various forms of irrigation.

One of the first things people want to know is how much will it cost to

install an irrigation system for a given area. About the only way to get a good answer to this question is to describe the situation and the requirements and to get estimates on it. Large installations will cost considerably less per acre than small ones. Portable systems will cost less per acre than permanent installations. Deep wells are much more costly both for digging and for pumping than shallow ones. Permanent installations of Skinner type irrigation with oscillators on small areas will cost as much as \$250. per acre. It is claimed that large areas of whirling irrigation can be taken care of with investments as low as \$15. to \$30. per acre. Of course, under specially favored circumstances, surface irrigation with a stream on the place can be set up with little cost except for labor.

With an irrigation system installed, the first question is when and how of-

EARLY this spring New York State farmers who had posted their lands against hunters and fishers heard a piece of news that astounded them. While the law said that signs warning against trespassing for hunting and fishing must be at least 11" square, a lawyer had interpreted this as meaning that the PRINTING on the signs must be 11" square, thus making illegal thousands of signs that farmers had bought and posted around their farms.

A storm of protest arose. Most sportsmen and sportsmen's organizations, as well as Commissioner Osborne and officials of the New York State Conservation Dept., appreciate the good will of farmers. They know that most farmers, even though their land is posted, will permit a true sportsman to hunt and fish so long as he will respect their rights.

If this lawyer was right, or at least until he was proved wrong, a hunter or fisherman could trespass on posted

ten should water be applied. Decisions on this point are made largely in the light of experience and rule of thumb. With broad and deep rooted plants well established, the soil may be allowed to dry out pretty thoroughly before growth is seriously checked. However, many of our vegetables have comparatively narrow and shallow root systems and one of the times of greatest need for irrigation is when the little seedlings have just come up or when plants have recently been set. In cases of this sort, irrigation should not be neglected. It is, in general, advisable to water thoroughly and not too frequently. In the home garden light waterings as so commonly practised, wetting only the upper half inch of soil, might about as well be omitted. A fair general rule, subject to rather wide modifications according to conditions, is to figure that the crops ought to get about an inch of water a week. If nature doesn't supply this much, irrigation may generally be used to advantage.

Considerable progress is being made in methods of judging water needs more accurately than has been possible in the past. The simplest method is the one mentioned above of relating water needs to actual rainfall. In most of our Northeastern territory, 3 inches of rain per month is about as much as we can expect so that there are few areas where there is not likely to be a month of rather serious drought each season. Sometimes there is much more than this and sometimes less. Various devices for registering the dryness of the soil are being tried out.

To Irrigate or Not:

After all, irrigation is no cure-all and costs must be faced. If the crops grown are too low in returns, irrigation is practically out of the question. On the other hand, South Jersey finds it profitable to grow cannery peas under sprinkler systems. In considering this question, it is well to take into account, the increased yields that are brought about by ample moisture supply; the improved availability of nutrients; the assurance of maturity at the expected time; the chance to make full use of land; and the improvements in market quality with most of our vegetables.

POSTED

New Law Stops Loophole in New York Law on Trespassing

property if the printing were less than 11" square, and if he were arrested, could use as his defense that the land was not posted in accordance with the law. Here was a disturbing situation, and if allowed to continue would have cost farmers thousands of dollars to buy and put up new signs.

To handle the situation, the Stokes Bill was introduced into the Legislature. It provides:

1. That signs already posted, which are at least 11" square, are legal.
2. That where missing or illegible signs are replaced, or in putting up signs for the first time, the sign, in addition to being at least 11" square, must have printed matter on it occupying at least 80 sq. in. of space.

This bill, which was passed by the Legislature and has been signed by the Governor, is an excellent example of prompt and efficient action taken to correct an intolerable situation. We

"Most farmers, even though their land is posted, will permit a true sportsman to hunt and fish so long as he will respect their rights."

want to congratulate everyone who had a part in securing the prompt enactment of this new law.

The law now requires that notices at least 11" square, with the printing occupying at least 80 sq. in. of space, be posted along the entire boundary of a farm, one on every corner and along the boundary at distances not greater than 40 rods. Notices must bear the name and address of the person posting the land, must warn all persons against hunting, trapping, or fishing on the land for such purposes or any other purposes.

To continue having the farm legally posted, missing and illegible signs must be replaced once each year during the months of March, July, August or September.

As a service to our readers, we have for years furnished at a nominal cost printed canvas signs to meet the requirements of the law. The ruling responsible for the Stokes law raised a question as to their legality because the printing was almost, but not quite, 11" square. The Stokes law removes any question of the legality of these signs. The signs are still available. Write *American Agriculturist*, 10 N. Cherry St., Poughkeepsie, N. Y.

To many farmers, particularly those living near large cities, trespassing by so-called sportsmen has been an annoying problem. Gates have been left ajar, allowing cattle to destroy crops, guns have been discharged far too close to farm buildings, and trespassers have sometimes been abusive and threatening. *American Agriculturist* has for years maintained a position designed to be fair both to property owners and sportsmen. The state has invested money in stocking streams with fish and in studying game growing methods. Hunting and fishing are healthful outdoor sports, and by exercising reasonable caution and courtesy, these sports can be followed without damage or inconvenience to farmers. However, to curb the irresponsible hunter and to protect the rights of property owners, a strong posting law was necessary. *American Agriculturist* has, in the past, worked for such a law, as well as for its adequate common-sense enforcement. We will continue our efforts to curb the irresponsible hunter, at the same time fostering good will between true sportsmen and farmers

"Somehow, Porky, I don't believe it's the prickly heat that's bothering you!"

Get Ready For HIGH FALL Egg Prices

YOUR OPPORTUNITY to make money in the poultry business is to have lots of eggs to sell during September, October, November, and December. Eggs are scarce in the fall, and egg prices go up in the fall. A study of the average egg price for the past ten years shows that egg prices in November are nearly twice as high as eggs in May or June.

The way to get eggs in the fall is to grow and develop your pullets completely during the summer and early fall months. No poultryman wants to "force" his pullets into early production before they are ready to lay. He does, however, want to have the pullet ready to lay as soon as she is fully developed, and he wants to shorten the small egg or "pullet egg" period. The sooner you can begin getting full-size, salable, market eggs, the sooner you start taking in real money from your pullets.

The Purina Feeding and Management plan is designed to help give you big, well-developed pullets ready for early laying, with a short "pullet egg" period. If you prefer the mash and grain plan of feeding, you'll want Purina Growing Chow, the growing mash that goes with grain. If you follow the complete feeding plan, then Purina Growena is the feed that you want. It comes in both mash and checker (pellet) form.

As soon as your pullets begin laying, switch over to Purina Layena, the complete feed, or Purina Lay Chow, the mash feed that goes with your grain. See your Purina dealer today for full details of the Purina Feeding plan.

PURINA MILLS

Buffalo, N. Y. St. Johnsbury, Vt.
Wilmington, Del.

IN THE NEXT FEW ISSUES I want to share with you one of the biggest thrills I've ever had in my life—escaping from Albania. I also hope to make you realize how fortunate we are to live in our good old United States.

PART I—Off for Adventure

We sailed across the Atlantic, making our first stop at the old Rock of Gibraltar; then on into the Mediterranean to Naples, right under the shadow of smoking Mt. Vesuvius. Each day on our ship we eagerly scanned the wireless bulletins. War news had grown worse. Hitler grabbing more territory—Moravia and Slovakia. England protesting. America writing notes. Hitler paying no attention—taking Memel.

In Italy flags were flying everywhere. Mussolini made one of his stirring speeches. Wildly waving his arms, he shouted for Peace—but demanded Tunisia, Djibouti, and an interest in the Suez Canal as the price of Peace. He proclaimed that "geographically, historically, politically, and militarily, the Mediterranean, including the Adriatic Sea, is vital area for Italy." To give you a word picture of these Dictators, listen to Il Duce's closing words:

"We must arm—more guns, more ships, more airplanes are necessary, even at the cost of wiping out civilian life."

Meanwhile England prepares for trouble, building underground shelters for protection against air bombs; scenic artists are camouflaging public works and factories to make them look like churches. England said:

"We must deny ourselves, train ourselves, strain all our resources to make the military strength of the Empire sufficient for its defense."

At home in America we feel safe. Over in Europe nobody feels safe. I asked an able observer: "What will Hitler and Mussolini do next?" His answer was, "Can you read what's going on in the brains of Dictators who place no value on human life?"

Another comment I heard gives me the creeps: "Everywhere the people are called on to sacrifice to the bone, leaving scarcely enough for themselves to maintain subsistence. When all has been exhausted, what then? LET THEM EAT CANNONS!"

We crossed over to Venice where we met our 14-year-old grandson, John Parker Compton, who had been in school in Switzerland. As I looked at him, clear-eyed, sparkling, upstanding, I said, "Cannon fodder for Dictators who would draw us into war."

Why should we fight? We gave of our strength in the World War in men and money. To what avail? Today the world is worse off than it was before, even though we won. "Making the world safe for Democracy" sounds like a joke. Nations owe us enormous debts which they never expect to pay. Another race for armaments is on. Even in our own country—thus increasing the burden of taxation.

I've just read a bulletin telling of the millions upon millions of foreign gold shipped each week to the United States for SAFETY. We are the one haven in the world today. Why should we want to get mixed up in foreign affairs and fight in another war when we know war settles nothing—but just makes matters worse?

I'm for PEACE . . . and I realize more than ever that it's a precious privilege to be an American.

Our next chapter will be about our Adventures in Albania and about Zog I, King.

DOWN THE

By J. F. (DOC) ROBERTS

AUCTION selling of livestock or farm products of any kind calls for caution and a lot of thought. Large cooperative selling agencies, whether by auction or private transaction, can maintain farm selling or buying power and thereby influence price. Scattered non-cooperative selling agencies, whether auctions or not, can only lessen buyers' competition and thereby lower prices. Unfortunately, when a price is broken at one point, it tends to break everywhere, because every buyer must compete with the low-cost product of his competitor. Also, it costs money, which the producer always pays, to maintain numerous auctions or farm selling organizations. A lot of little, non-cooperative, built-for-profit auctions, or selling agencies can DISPOSE of goods of any kind, but is that marketing and does it bring more of the consumer's dollar back to the farm, or less? That is the question that every livestock man and every farmer in the Northeast must think about seriously.

* * *

Horses are selling too cheap, really below the cost of production. If you are going to need a horse or two, even next spring, now is the time to begin to look around; and you can afford to shop, because a good many Western horses are now selling below original cost. Sleeping sickness in horses, up to the present time anyway, is not developing this year. My son writes me from Kansas they have had just one case, while a year ago they had many. Why this should be, no one seems to know.

* * *

The entire livestock picture has changed with the rains of the last few weeks. Abundance of feed all over this country, including the so-called "Dust Bowl," has made the man with livestock to sell very much more independent, and the buyer more anxious, which has brought about higher prices with the one exception of horses. Hogs are selling fully a dollar a hundred higher than they were, and a good many people have asked me why hogs were selling down around 7c a pound, with other livestock so much higher. With lard selling for less than the live

price of hogs, we do not have to go far for the answer. There is a very definite campaign on to increase the use of lard, and the farm wife will play a very important part in the future hog price structure by her use of lard, and her refusal to buy lard substitutes. Already hogs are selling around the \$8 mark, and will go higher if the great amount of storage lard can be moved.

Cows and bulls for bologna and hamburger purposes are selling very actively, as high as at any time, and again it is a fine time to cull out your non-profit cows. Good lambs are continuing to sell above the \$10 mark, with a good demand, and prospectively are going to bring satisfactory prices this late summer and fall. Calves are continuing to bring \$10, with a good demand, and so the predicted low livestock prices for this summer and early fall will not materialize. However, am advising and suggesting caution in buying all classes of feeder stock. With the opening of the Canadian cattle quota the first of July, receipts have been about 25% of what they were the first week in the April quota, and it does not look as if Canadian cattle in this quota, which runs to October 1st, will seriously affect cattle prices of any kind. This is due to the fact that cattle prices in Canada have advanced, making it more or less unprofitable to ship to this country.

LIVESTOCK Sales & Events

- Aug. 8 Vermont Guernsey Field Day, Tharon Strong Farm, Craftsbury, Common, Vt.
- Aug. 12 Grange Day at New York World's Fair.

CONNECTICUT UNIVERSITY COW SETS RECORD.

A world's record for lifetime milk production was reached July 1st by Radiant Romance, 16 year old Jersey cow of the University of Connecticut. Her lifetime production of milk has reached a total of 151,218 lbs. It is said she is still going strong. The American Jersey Cattle Club has officially accepted Radiant Romance's record. The milk produced is enough to keep an average family supplied with 2 qts. of milk daily for 100 years. Her butterfat production is equivalent to 10 times her own weight in butter.

PERMANENT PROFITS

If you want to be sure of silage satisfaction, get a Grange Silo. It is the silo that offers the most time and labor saving features, is more economical and durable, and returns greater profits.

You will be money ahead with a Grange. Better milk production, saving in time, labor and space, and the saving of your pasturage during the hot summer months will more than repay you on your investment in a Grange.

Colored folder sent free on request. Write today and start on your way toward Grange's "Permanent Profits".

N. Y. & N. E. Apple Institute Elects Chandler as President

JOHN CHANDLER of Sterling Junction, Mass., is the new president of the New York and New England Apple Institute, succeeding John Lyman of Middlefield, Conn., who has served during the four years of organization.

Frank W. Beneway of Ontario, N. Y., succeeds James G. Case of Sodus, J. Wessel TenBroek, Jr., of Hudson, N. Y., was elected secretary, and E. Stewart Hubbard of Poughkeepsie, N. Y., was re-elected treasurer.

Thomas H. O'Neill of Rochester was continued as manager and many tributes were paid to the value of his work during the past two years. It also was voted to move the office of the institute from Poughkeepsie to New York City to place it in closer contact with the world's largest consuming market.

In recognition of their leadership, institute directors presented Lyman and Case with brief cases. One year ago the institute was faced with an empty treasury and a large deficit. On top of that, last summer's hurricane in the New England States threatened to cut income seriously. In spite of that a full program of work was carried out during the year and Lyman reported that the balance on hand was sufficient to carry the work well into the new year.

Apple Growers' "Problem"

The "heart of our problem" was presented graphically to members of the New York and New England Apple Institute at its annual meeting in Springfield, by Thomas H. O'Neill, institute manager.

"I hardly need to tell you that we are faced with a problem of selling apples," O'Neill said, "but I think I can illustrate that problem a little by quoting some statistics from the federal agricultural department."

In 1920 and down to the present, he explained, the total United States apple crop has averaged around 150 million bushels. "We have not increased production," O'Neill said. "Many old trees have been pulled out and while younger trees have been coming on we have kept production in pretty good balance. In spite of this, our prices have declined continually."

In 1920 the average farm price of commercially packed apples was \$1.40 per bushel. In 1930 it was \$1.20 and for the 1935-38 period it dropped to 90 cents.

In 1920 total production of oranges was 25 million bushels, in 1930 it was 50 million bushels and in 1938 it was 65 million bushels. In 1920 grapefruit production was 6½ million bushels, in 1930 it was 15 million bushels and in 1938 it was 30 million bushels.

Competition

O'Neill said Northeastern apple growers face competition from three main sources:

1—Apples from other producing

sections seeking outlets in our great eastern consuming centers.

2—Enormous and increasing crops of citrus fruits seeking markets everywhere and flooding our eastern markets.

3—Canned fruits of wide variety which have made a special appeal to the housewife to rely upon the can opener.

Added to this, O'Neill stated reduced consumer purchasing power has made it impossible for many persons to buy the things they want or in as great quantity as they might wish. The same condition has resulted in many merchants offering bargains, frequently of competing products. Changes in transportation have been found to accentuate this condition. As one instance, O'Neill cited truckers hauling cheap fruits hundreds of miles to compete in local markets. Another factor against consumption of home-grown apples has been the effective sales and advertising programs of other products.

The Answer

Previous to formation of the institute, a cooperative organization of growers assessing themselves one cent a bushel, western apples received all of the promotion in eastern markets, O'Neill said.

"Since the institute began to 'sell'

apples two things have happened.

First, other areas have been forced to look to their local markets and have formed similar organizations. While competition still exists, there is a tendency for each group to concentrate more on its own area and to join together in national promotion for apples.

Second, in the Northeastern States an intensive campaign has been conducted to give priority to Northeastern apples. Cooperation of the trade and many other agencies has been obtained, "so that in a large measure we have been taking the apple from the back shelf and restoring it to its old-time glory as the King of Fruits."

The healthful qualities of apples have lent themselves to winning popular favor and the result of all this effort is having cumulative results. O'Neill made it plain the institute cannot change general price levels or restore consumer purchasing power, "but we can and are making an active bid for our share of the consumer's dollar. The percentage of eastern apples used in eastern markets is mounting and in like ratio the trend of western apples in our markets is downward. For the first time in a generation the per capita consumption of apples in the New York area is climbing."

ENGINES STAY CLEANER

When You Use Mobiloil

IMPURITIES ARE OUT!

MOBIL OIL IS DISTILLED, REFINED, DEWAXED, FILTERED

WON'T FOUL SPARK PLUGS

WON'T STICK VALVES

WON'T GUM RINGS

WITHSTANDS THE TERRIFIC HEATS AND PRESSURES OF MODERN HIGH-SPEED ENGINES

This is One of 4 ways Mobiloil's

Balanced Protection

Saves Money In Cars, Trucks, Tractors

THAT'S YOUR CAR'S HEART above. But the facts apply to *all* engines...—you must have clean oil to keep rings, valves, "plugs" working efficiently.

However, cleanliness alone isn't enough! For *complete* economy, you need *all* good oil qualities...oil that resists wear, gum, carbon, fuel-wasting "oil drag," *equally* well!

Mobiloil does that...gives "Balanced Protection"...helps keep *all* engine costs low. Socony-Vacuum Oil Co., Inc.

MOBIL OIL

A GOOD MAN TO KNOW

Your Mobiloil-Mobilgas Man Has a Complete Line of Money-Saving Farm Products!

MOBIL OIL—gives "Balanced Protection." All good oil qualities—not just one or two.

MOBIL GAS—delivers "Balanced Performance." A scientific blend of every good gasoline quality.

POWER FUEL—special tractor fuel. Smooth, even-burning, powerful, economical.

MOBIL GREASE NO. 2—the all-purpose farm grease. "Half as much lasts twice as long."

MOBIL OIL GEAR OILS—all grades. Highest quality.

KEROSENE—pure, clean-burning. Refined by experts.

WHITE GASOLINE—Finest quality! Clear-burning in gasoline appliances.

BUG-A-BOO—kills insects quickly, surely. Stainless.

SANILAC CATTLE SPRAY—won't irritate eyes or hide. Effective all day long.

He has lower-priced lubricants also—made by the makers of Mobiloil—economical for equipment whose age or condition does not justify the highest grade.

USE MOBIL GREASE NO. 2 ON HIGH-SPEED CHAINS AND SPROCKET WHEELS!

Mobilgrease No. 2 stays on the job...won't throw off or wash out. Try this fine lubricant.

NORTHEASTERN *Slants* ON THE *National* NEWS

■ Union and Wage Troubles Pester Farmers

TYPICAL of National Labor Relations Board rulings is one affecting California and Arizona melon and vegetable shippers. Ruling states that workers for packers engaged in interstate commerce and who pack produce in sheds are not agricultural laborers, as their employers claim.

Ruling orders secret election among workers to determine whether they wish to belong to the "C.I.O." or "Fruit and Vegetable Packers Association of California", an unaffiliated union. Rumor is that growers will take case to Supreme Court.

SLANT: Farmers have no choice. They must fight rulings like this or sit idly by and watch trend toward unionization of all farm help.

Another situation bothering certain farm groups is Wage-Hour Law. Hopeful sign comes from Florida where Judge Ackerman granted temporary injunction prohibiting enforcement of the Federal Wage-Hour Law in Florida citrus industry. Injunction will continue probably until hearing in Fall. Action was taken by growers not to test constitutionality of the law, but to test interpretation made by Administrator Elmer Andrews who holds that *only* packing plants in the country or in towns of less than 2500 population, and which receive fruit from within a radius of 10 miles shall be exempt from Wage-Hour Law.

■ Trying to Wean WPA

AS WE go to press, thousands of WPA workers have gone on strike as protest against provision in new federal relief act which makes them work 130 hours a month to earn their relief check. Since 1935, skilled relief workers have been getting regular union rates or "prevailing wages" and so have been able to get their maximum relief allowance by working short hours. In New York State, for instance, electricians, plumbers, etc., have gotten their \$20 weekly relief check by working about 10 hours a week. New law compels them to put in more than twice as many hours for same pay. WPA administrators warned workers on strike that they would be dropped from relief rolls after five days absence.

Commissioner F. C. Harrington, WPA head, recommended the 130-hour work month to Congress. He stated that the short WPA work month had made it possible for skilled workers to earn their relief check in short hours, and also take an outside job under another name. Result was that there were many on WPA rolls who did not need relief.

One WPA official, commenting on WPA strike, said: "The idea of striking against relief is just fantastic." Nevertheless, strike is real enough. In Minneapolis last week, policeman who rescued a non-striking WPA worker from a flying picket squad was killed in a mob in which 1000 demonstrators took part. He was pounded over the head and shoulders by a half dozen men as he tried to put the WPA work-

er on a street car for home.

Trouble occurred when 30 policemen escorted from a WPA sewing project 100 or more women and men who refused to go on strike. They were hissed and booed by WPA strikers, who finally rushed the police and herded the non-strikers in a parking lot, where they pelted them with pebbles, sticks and broken glass. Policeman's death occurred in protecting one of non-strikers who had fainted.

Both American Federation of Labor and Committee of Industrial Organization are demanding that Congress restore old wage scales. Several bills to repeal new wage regulations have been introduced into House by Representative Sabath of Illinois (Democrat) and three other representatives.

SLANT, BY E. R. EASTMAN: On Lexington Avenue, New York City, a few days ago, I saw hundreds of people marching up and down one side of the street, shouting and waving banners. I said to a policeman: "What's the noise all about?" He replied: "They are WPA workers on strike, and they call themselves Americans!"

That officer expressed my sentiments better than I can. When you think of the lengths to which the government has gone to help people, even to the extent of saving their self-respect by giving them work to do, and then think of this WPA strike, it makes one wonder where it is all going to end. This situation proves again that you cannot give people an opportunity to lean on a crutch and then take the crutch away. Most emergency measures tend to become permanent ones.

The worst result of all the economic troubles of the past years has not been the piling up of the ruinous debt, bad as that is. It is the weakening of the character of the American people.

■ President Regains Power to Revalue Gold

PASSED by Congress July 5 and signed by President July 6 was bill renewing for two years President's power to devalue dollar and to operate two billion dollar stabilization fund. Stabilization fund is used to buy and sell foreign exchange for purpose of keeping it stable so that dollar at different times will buy about the same amount of currency of other nations. In 1934 President used power of revaluation to change gold price from \$20.67 to \$35.00 an ounce. Under law President can reduce gold back of dollar to 50 per cent of figure before 1934 revaluation.

Included in bill was clause setting price of newly mined domestic silver at 71.1c an ounce, changing former price of 64.64c an ounce under which Treasury formerly had purchased silver.

Result of passing of bill was clean-cut victory for President who argued continuation of power was necessary as a safeguard in case foreign governments tried currency devaluation to gain trade advantage.

Commenting on restoration of President's power of devaluation, Master Farmer Grant Hitchings of Nedrow, N. Y., said:

"I recently attended a conference of business men and farmers at New York City to consider currency management. There it was pointed out that foreign governments had already

taken advantage of power to devalue their currency to give them distinct advantage in trading with this country. The President said that he needed the power to devalue the dollar to meet such an emergency. The emergency is here. Farmers would like to know what the President is going to do with the power given him."

■ News from Washington

POSSIBLE date for adjournment of Congress has been moved up to August 1 or mid-August. Here is status of unfinished legislation as we go to press:

Neutrality Law

On July 11, Senate foreign relations committee voted to postpone until next session of Congress further consideration of amendments to present neutrality law, which requires President on outbreak of a foreign war to ban shipments of American munitions to countries at war. Both President and Secretary of State Hull have asked that arms embargo be lifted. They argue that it increases chances for war by letting aggressor nations know that their victims can't buy arms from U. S. Many commentators agree with this view. Latest report is that President will send an urgent message to Senate, pressing for favorable action this session.

Social Security

Slated for speedy enactment into law are amendments to liberalize Social Security Act. Revised bill would keep old-age insurance tax on both employer and employee at 1 per cent for next three years, and restrict unemployment insurance tax on employers to first \$3,000 of employee's salaries. Combined savings under these changes would save taxpayers about \$905,000,000.

In addition, amendments would provide additional benefits for retired workers with aged wives; would begin payments to beneficiaries next Jan. 1 (instead of Jan. 1942); would offer monthly benefits to deceased workers' survivors (instead of present lump-sum grants). Senate version of bill also carries amendment exempting all news carriers from act's provisions. (Agricultural labor is now exempt from social security taxes.)

New Recovery Program

Introduced into Congress on July 10 was bill covering President's new lending project, supposed to stimulate business through loans raised by sale of government-guaranteed securities. Bill, officially known as Self-Liquidating Projects Act of 1939, recommends loans totaling \$3,600,000,000 (\$260,000,000 less than President asked for). Following types of loans are planned over a period of years: \$350,000,000 for non-Federal public works; \$750,000,000 for self-liquidating express post roads and highway improvement; \$500,000,000 for railroads; about \$500,000,000 for rural electrification loans; \$500,000,000 for self-liquidating farm tenancy loans; \$100,000,000 for loans to promote foreign trade.

Speaking over radio, Representative Joseph Martin of Massachusetts, Minority Leader of House, called the bill

"President's new pork barrel bill." He pictured Administration as dancing around the "political Maypole" and singing "Let's spend \$4,000,000,000 more" on top of \$3,600,000,000 deficit for fiscal year which ended July 1.

6-Year Term for President?

Reported to Senate is Senator Burke's proposal for constitutional amendment to limit term of President of United States to six years. This is not first time that question has arisen in Congress, as record shows that two-thirds of 150 proposed constitutional amendments have sought single-term limitation. In 1912, Democratic national convention adopted such a resolution, which was later approved by Senate but killed in House because of opposition of President-elect Wilson, who argued that the people should pass upon President's record. Argument for single six-year term is that President would not have to take his mind off affairs of state to campaign for re-nomination; also it would tend to take politics out of the office. Proposal now before Congress could not become effective until both House and Senate passed it with a two-thirds majority and three-fourths of the 48 States ratified it.

For detailed report on monetary legislation, see article on this page, entitled "President Regains Power to Revalue Gold."

■ Case Against Labor Leader Opens

AT ANGEL ISLAND, U. S. Immigration Station in San Francisco Bay, is being held a deportation hearing which is attracting nation-wide attention. Hearing is conducted by federal Department of Labor and is to decide whether Harry Bridges, influential West Coast labor leader, is to be sent back to Australia.

Bridges came to this country in 1920. Since then he has become powerful as leader of West Coast Longshoremen's Union, and his influence has even spread to the East. He has been frequently charged with being an alien member of Communist organization which "advocates the overthrow by force and violence of the government of the United States." Up to now, all efforts to get him deported have been resisted by federal Labor Department, with result that Secretary of Labor Perkins has been accused of shielding him.

On first day of hearing, Bridges flatly denied that he was or had been a Communist. His attorney, Miss Carol King, charged that certain employer groups were spending large sums of money to get rid of him, because of his strength as a labor leader.

Testifying against him, Major Lawrence Milner, government witness who has been making an under-cover investigation of Communist activities, said that Bridges was a Communist, that they had attended meetings together, and that he had seen him pay dues to the organization. "Bridges," said Major Milner, "was the Communist party's most important man in the labor drive on the West Coast."

■ A Matter of Opinion

ANOTHER interesting poll of public opinion has been conducted by Gallup American Institute of Public Opinion. This time idea was to find out what the people think of certain leaders, and whether they would class them as liberal, conservative or radical.

Results of poll for 8 well known political figures were as follows:

President Roosevelt: 62 per cent classed him as a liberal; 1 per cent as

a conservative; and 37 per cent called him a radical.

Vice-President Garner: conservative, 64 per cent; liberal, 32 per cent; radical, 4 per cent.

Ex-President Hoover: conservative, 92 per cent; liberal, 5 per cent; radical, 3 per cent.

Secretary of State Cordell Hull: Liberal, 46 per cent; conservative, 51 per cent; radical, 3 per cent.

Thomas E. Dewey, a possible presidential candidate (Republican) for 1940: 47 per cent classed him as liberal; 45 per cent as conservative; 8 per cent as radical.

Postmaster James A. Farley: Liberal, 63 per cent; conservative, 13 per cent; radical, 24 per cent.

Mayor LaGuardia of New York: Liberal, 64 per cent; conservative, 8 per cent; radical, 28 per cent.

Secretary of Commerce Harry Hopkins: Liberal, 55 per cent; conservative, four per cent; radical, 41 per cent.

SLANT: Most interesting thing about these ratings is that, though percentages differ, each man appears to some voters as a liberal, to others, as a conservative, and to still others as a radical. Well, it's all the way you look at it.

Voters' definitions as to what makes a man a liberal, a conservative, or a radical are worth reading: A "Liberal" was variously defined as a man who "wants to bring about a better society", one who "wants to see the little man get ahead", and one who "is willing to spend money for the common people." The "Conservative" was described as a man who "wants to do things solidly and slowly—conserve things", one who "wants to keep the best of what we've got", and one who "keeps within his means." Best definition of a "Radical" was, "He is a man whose feet are planted firmly in the sky."

Eyes on Hitler

DURING fortnight, Free City of Danzig in Polish Corridor continued to be greatest danger point in Europe, as all world waited to see what Hitler had in mind. Although German Nazis now deny any designs on Danzig or Poland, signs of German military activity in Danzig were rumored and a sudden German coup that would make the Free City once again part of Germany was feared.

Danzig has been held at different times by both Poland and Germany. At close of World War, it was capital of West Prussia. Treaty of Versailles separated it from Germany and gave it status of free city under protection of League of Nations. Poland's rights there are economic and insure her free access to Baltic sea. City's population is mostly German, and last week Danzig Nazi leader Foerster said: "We in Danzig declare we want to return to Germany and we declare further that we will return!"

Poland has repeatedly warned that she will fight any change in status of city which is so important to her economically that it is called the "Polish window on the Baltic." Three months ago, Britain and France guaranteed to help Poland if she were attacked and her independence threatened. This pledge followed Germany's final swallowing up of Czecho-Slovakia in defiance of promises which she made at Munich. Last week, Britain's prime minister Chamberlain again warned Germany that Britain will fight for Poland, and he made it perfectly clear—in case Hitler wasn't sure—that any move against Danzig, whether by armed invasion or by a political change which would bring German Nazis into power there, was included in British pledge to fight.

In addition to talk, British government has made other moves calculated

to sober Hitler. It is proposing to lend about \$234,000,000 to its allies in the anti-Hitler bloc—Poland, Rumania, Turkey and Egypt—to strengthen their military machines; also, during fortnight it continued to try to get a military alliance with Russia.

Next move seems to be up to Hitler, whose real goal in wanting Danzig is believed to be part of his program to dominate Central Europe. Danzig, though of little value to him, would be opening wedge to Polish Corridor, and eventually to Poland itself.

Editors Will Be Grateful

MAIL CARRIERS will have lighter loads as a result of O'Mahoney Amendment to 1940 Postal Appropriation Bill. Prohibited by amendment is sending by federal agencies under the franking privilege of reports, periodicals, bulletins, pamphlets, lists or other articles unless the service has been requested.

For several years desks of editors, and other persons as well, have been buried with propaganda from dozens of new federal bureaus and divisions. Merely to read this material would keep one man busy 24 hours a day. Inevitable result was that wastebaskets received most of it.

Thanks, Mr. O'Mahoney!

Milk Drivers' Strike Postponed

LAST ISSUE (page 3) carried report of threatened strike of milk drivers in New York City. Later at meeting called by Mayor LaGuardia, representatives of distributors and drivers agreed to try to find peaceful solution of differences and called off strike pending further conference.

Dispute arose over renewal of contracts expiring July 2. Drivers want more pay and changes in working conditions.

Life Expectancy Rises

AVERAGE wage-earner or his dependent can now expect to live 15 years longer than he could back in 1911. Assurance comes from Metropolitan Life Insurance Company. Company's statistics show that in 1911, when it first started to keep records, industrial policy holders could expect to live about 46½ years. Last year, this figure rose to nearly 62 years, a gain of 1.23 years over 1937 figure.

Life expectancy for United States population as a whole is slightly higher than for industrial policy holders.

U. S. Biggest Butter Producer

LAST 30 years has seen big expansion in dairy industry the world over, according to report recently published by Bureau of Agricultural Economics. Butter production for 21 leading countries is said to have averaged nearly 6,700,000,000 pounds a year during period 1931-35, as compared with less than 4,500,000,000 average for period 1909-13. Leading all of these countries is United States, its butter output for period 1931-35 having accounted for more than one-third of total figure for the 21 countries.

Second leading butter-producing country is Germany, but its annual output is much smaller than United States'. France ranks third.

Statistics on cheese compiled by the Bureau cover 16 countries and show

another big increase for period 1931-35 as compared with period 1909-13. Germany produced nearly 22 per cent of total cheese output for the 16 countries. United States was second with 16 per cent; Italy, 15 per cent; France, 14.5 per cent.

All the Comforts of Home for Cows

WHAT COWS need are air-conditioned barns, according to an official of Federal Bureau of Agricultural Engineering, M. A. R. Kelley. Speaking at annual meeting of American Society of Agricultural Engineers at University of Minnesota this month, Mr. Kelley declared that if farmers would regulate barn temperature, "the milk cow will reciprocate with increased production."

When Minnesota farmers heard of this, there was plenty of comment. "Idea might be all right for the big dairyman but it just wouldn't pay for us little fellows," said Clarence Selen-sky of Sauk Center, Minn., whose cows have topped their breed in Minnesota milk production. And his wife had something to say about it. "I should say not," said she. "If there is going to be any air-conditioning on our farm, it will be in the house, not the barn."

One farmer said that if things were coming to that, he had better get out of business. Another observed that most farmers keep their cows in the fields night and day during the summer and he wanted to know how you could air-condition pastures.

Frozen Foods Double Sales

LAST YEAR, frozen food sales jumped up 50 per cent above 1937 sales, according to figures published currently in *Business Week*. The 1938 sales totaled \$25,000,000, and the industry is now looking for new fields to conquer, both at home and abroad. Experiments are being carried on with new channels of distribution, and by some canners and can manufacturers who instead of worrying about competition are taking on frozen food lines of their own.

One California concern is experimenting with a process by which fresh food is placed in cans and quick-frozen. If successful, it is predicted that this

experiment may result in greatly cutting cost of frozen foods to consumer, making them just a little higher than ordinary canned foods.

Also interested in the business is ice cream division of dairy industry. Frozen foods need plenty of storage space, and empty rooms in ice cream plants during slack winter season are said to be ideal solution of problem.

Lockers for Home Use

Twelve commercial cold storage plants offered freezer-storage facilities for storing food products for home use in New York State last year, according to I. R. Bierly of department of agricultural economics at Cornell University. Two of the plants were co-operative, and the other ten were privately owned. Of the 427 patrons who used them, 73 per cent were farmers. Foods stored were largely meats and fruits, including strawberries, raspberries, sour and sweet cherries, and peaches. Only about one-third of the patrons stored vegetables. Majority of patrons, says Dr. Bierly, claim the service is a money-saver and that the work of preparing products for freezer-storage is easier than canning.

Good Books to Read

TO HAVE, TO KEEP, Jane Abbott. Jane Abbott's romances appeal to many readers, including young girls in their late teens. In this, her latest one, the author deals with the modern problem of marital adjustment. The marriage of Diane Tarrell, wealthy butterfly, with Bill Arden, an almost over-serious young lawyer, brings many a problem to be solved, and around their efforts to make a success of their marriage the author has built an interesting story.—*J. B. Lippincott Company.* \$2.00.

OFF WITH HER HEAD, G. D. H. and Margaret Cole. Terror and destruction within the quiet Gothic walls of Oxford. A woman's head found in a biscuit tin in the empty rooms of a student, a missing student, a street accident, all combine to make a fast-moving tale.—*The Macmillan Company, New York.* \$2.00.

Good Movies to See

THE CITY. First shown at the New York World's Fair, *THE CITY* is a film which traces the evolution and suggests the future possibilities of American urban life. It starts with a short survey of life in an old New England village, goes on to large cities, and ends with an optimistic glance at the town or city of the future.

Completely NEW!

Remington Model 17

HERE IS THE ONE TYPEWRITER THAT IS WHOLLY AND COMPLETELY NEW . . . and with it Remington steps into unquestioned leadership in the field of the so-called standard machines. In this classification, no other typewriter has so many wanted features, so many obvious advantages. Users everywhere say it is the finest standard typewriter ever built. Try it and You'll say the same.

Certainly, a trial without obligation. Call the Remington Rand Office.

BUFFALO . NEW YORK

from SKEFF'S NOTEBOOK

By L. B. SKEFFINGTON

THE Rochester Cooperative Milk Producers' Bargaining Agency is the third organization of its kind and now is in process of trying to bring stability of prices to producers. So far a fine spirit of unity has been shown by producers of all groups.

This spring when prices tobogganned there was agitation for a bargaining agency, which gained momentum with two successive cuts in retail milk prices. The six active and two non-active cooperatives in the Rochester market, together with representatives of the independents, got together and found that for the most part they were in the same boat.

Of the 1,800 producers supplying the market it was found that about 350 did not belong to any cooperative. The independents after several meetings formed a co-op to participate in the bargaining agency. Group meetings are planned to acquaint producers with

plans to give them opportunity to sign contracts.

Food Stamp Plan Pleases

Rochester, scene of the first trial of the food stamp plan for distribution of surplus crops, appears to be demonstrating great possibilities for this method. Each two-week period since the plan was instituted has found more persons taking advantage of the opportunity to buy orange stamps and receive gift of blue stamps from the government.

As has been explained, the orange stamps are sold to persons receiving relief funds and are redeemable in grocery stores for any food. With orange stamps each recipient gets blue stamps half the value of the orange stamps he buys. The blue stamps are exchangeable only for surplus foods. Fresh peas, onions, cabbage, tomatoes and a few other crops have been added to the surplus list. Oranges and grapefruit have been removed.

Why the Plan is Better

Recently I received a letter from a Wayne County grower who expressed indignation at apparent indorsement of the government's food stamp plan. It is apparent that he does not understand it, although during the past two or three years he was much in favor of government removal of surplus apples.

Most of the farm groups have asked the government to assist in taking care of surplus crops by using public funds to buy them and distribute them to persons in need. In a number of instances this has been of material aid to growers. Into the picture, however, crept criticism that government buying and distribution was expensive and unwieldy; that such distribution competed with private business, and that government price-fixing on surplus crops at times tended to depress prices to growers.

The stamp plan eliminates these objections. The grocer buys his supplies where he pleases. Government has nothing to do with the price at which he buys or sells. He is in competition in buying and selling. The government gives blue stamps to relief clients and says "with these you may buy only certain commodities designated as surplus."

"The reason I am in favor of this plan," a leading grocer told me is that it is the first step to taking the government out of business."

Incidentally, Congress has appropriated 203 million dollars for surplus purchases in place of the 90 million in the past year.

Old Rogers-Allen Law Constitutional

On July 1, under amended Rogers-Allen Law, the milk marketing order for Buffalo again became effective. Eleven days later New York State's highest court unanimously reversed Judge Bergan's decision and declared original Rogers-Allen Law constitutional.

On July 1, under amended Rogers-Allen Law, the milk marketing order for Buffalo again became effective. Eleven days later New York State's highest court UNANIMOUSLY reversed Judge Bergan's decision and declared original Rogers-Allen Law constitutional.

One effect of ruling is that about \$5,000, which five Buffalo dealers refused to pay into the equalization fund,

is now legally collectable.

Important also is court's justification of dairymen's efforts to work together. Decision was not only unanimous but more inclusive than Supreme Court's decision on the Federal-State Milk Marketing Agreement. The decision will make less likely any attempt to challenge constitutionality of the reinstated Buffalo milk order.

Taber at Berlin Picnic

On August 2 Rensselaer County, N. Y., Pomona Grange will hold its annual all-day picnic at the home of Assemblyman Whitney at Berlin. National Master Taber will be present and will speak in the afternoon.

All Grangers are invited, and doubtless many will accept as opportunities to hear the National Master are all too few.

New York Legislature Again Goes Home

Special session of New York State Legislature, which convened June 23, finally adjourned at 11:32 on July 10. Session was called to consider budget declared unconstitutional by Court because of substitution of so-called "lump sums" for itemized appropriations.

Legislature stood by guns and again passed a \$390,000,000 budget in the face of attempts to restore parts of \$25,000,000 cut in budget proposed by Governor.

Legislature (1) turned down proposal to restore \$10,000,000 cut in state

aid for education and \$7,000,000 cut in highway funds; (2) refused to reconsider bill to repeal law suspending annual salary increases for state civil service workers; (3) rejected bill to prevent closing of New York kindergartens and night schools which city claims is necessary as result of cut in educational funds; (4) approved supplemental appropriation bill for \$121,123.83 to pay cost of court test on constitutionality of budget passed during regular session and cost of special session required to repass it.

New York State Fair August 26—September 9

Plans for the New York State Fair at Syracuse from August 26 to September 9 are well under way. Premiums will exceed the sum of \$60,000 for 13 old departments and 1 new one, which is under the head of "Home-Made Equipment" with James Morse of Levanna, N. Y., as superintendent. This new department L has been added to stimulate the making of labor-saving and safety equipment for the farm and farm home. Premiums in this department will total \$400, with special awards being given by Cedar Cliff Farm of Levanna and the G.L.F.

On the sport side there will be races for harness horses and running horses, as well as for motorcycles and the annual 100-mile automobile race.

For the 15th year American Agriculturist and the Farm Bureau will conduct a State Horseshoe Pitching Tournament. Dates are August 29-30.

Grange Bread Baking Contest News

AMONG the prize winners listed this time are several women who have carried off first prize in previous baking contests sponsored by the Grange and *American Agriculturist*: Helen Carlson, of Helderberg Grange, Albany County; Rosa Giesler, of Lombard Grange, Chautauqua County (has won first prize for third year in succession); Mrs. Robert F. Glor, Attica Grange, Wyoming County; Mrs. John J. Harnett, Altona Grange, Clinton County; Mrs. Florence Phelps, Twin Valley Grange, Broome County, and others.

Mrs. Grace Hollister, winner of Nowadaga Grange's bread contest, (Herkimer County) has baked her own bread for 36 years. Chairman Mrs. Beatrice Harwick, who sent us this bit of news, says that she got it direct from Mr. Hollister, who has had the benefit all these years of Mrs. Hollister's fine bread.

Here is the complete list of subordinate grange winners since last time:

Subordinate Grange Winners

COUNTY	GRANGE	WINNER
Albany	Clarksville	Mrs. Floyd Lounsbury
	Helderberg	Helen Carlson
Allegany	Andover	Nellie Mead
	Belfast	Mrs. Fred Lilly
	Friendship	Mrs. Fannie Bissell
	Granger	Mrs. Alden Luckey
	Hallsport	Mrs. Merle Matteson
Broome	Deposit	Mrs. Frank Thomson
	Sanitaria Springs	Mrs. Fannie Jenkins
	Twin Valley	Mrs. Florence Phelps
Cayuga	Moravia	Mrs. Elmer Nye
	Sherwood	Mrs. James F. Ryan
Chautauqua	Arkwright	Mrs. Viola Holcomb
	Frewsburg	Mrs. Edwin Swanson
	Lombard	Rosa Giesler
	Sheridan	Mrs. Martha Meyers
Chemung	Big Flats	Mrs. Herbert A. Hammond
Chenango	North Norwich	Mrs. Lillian M. Schrader
Clinton	Altona	Mrs. John J. Harnett
	Valley	Mrs. Minnie Seguin
Columbia	Ancram	Mrs. Carrie M. Card
	Copake	Mrs. Frank Ounning
Cortland	Marathan	Mrs. S. E. Robinson
Delaware	Pepacton	Mrs. Harry Shaw
	Walton	Mrs. Gracia A. Neale
Outchess	Freedom Plains	Mrs. Rosamond Fowler
	Millerton	Mrs. J. O. Tiedeman
	Mt. Hope	Mrs. C. A. Van Voorhis
	Rock City	Mrs. Ethel Jones
	Union Vale	Mrs. Wilbur Van Tassell
	Upton Lake	Winifred Bowman
Essex	Whaley Pond	Mrs. Minnie Davis
	Wadhams	Mrs. Minnie J. Pierce
	Whallonsburg	Mrs. Emma Cross
Franklin	Bombay	Mrs. Fannie McCain
	Brighton and Harrutts town	Ward Rogers
Fulton	Malone	Mrs. J. Hollis Foote
Herkimer	Mayfield	Mrs. John J. Borst
	Nowadaga	Mrs. Grace Hollister
	Russia	Mrs. Theodore Pauli
	Warren	Mrs. Lester Young
Lewis	Lowville	Mrs. William Jones

Mrs. John Ross, of Stanley, N. Y., with her loaf of bread which won first prize in bread contest held by Seneca Grange, Ontario County.

Livingston	Groveland	Mrs. Leo Lenton
	Scottsburg	Mrs. May Traxler
Madison	Hamilton	Mrs. Floyd Bronson
	Morrisville	Mrs. John Black
Monroe	Ogden	Mrs. C. F. Rollins
Montgomery	Otsquago	Mrs. William Lighthall
Niagara	Hartland	Mrs. Walter Cramp
	Pendleton	Mrs. W. D. Miller
Oneida	Pleasant Valley	Mae W. Davis
	Rensen	Mrs. Jane Belle Morris
Onondaga	Canillus	Mrs. Chas. Peterson
Ontario	Canandaigua	Mrs. Royal Purdy
	Wide Awake	Mrs. Lydia Hall
Orange	Bullville	Mrs. Harold Tice
	Otisville	Mrs. Robt. L. Runnalls
	Montgomery	Mrs. Oaniel F. Taft
Oswego	Amboy	Richard Bolster
	New Haven	Mrs. Hazelton Spencer
	Pulaski	Mrs. Judson Champney
Otsego	Burlington	Mrs. Margaret Winters
	Lena	Mrs. Gertrude Morse
	Otego Valley	Mrs. Maggie M. Myers
	Pierstown	Mrs. Niles Eck
	West Laurens	Mrs. Clara Retherford
Rensselaer	Worcester	Mrs. Grace Tyler
	Johnsonville	Mrs. William Heslin
Saratoga	Tacon Valley	Mrs. Elsa Johnson
	Bacon Hill	Mrs. W. A. Sherman
	Saratoga	Mrs. Edw. D. Hathaway
Schenectady	Niskayuna	Mrs. Philip Male
Seneca	Lodi	Mrs. Carrie J. Huff
	Tyre City	Mrs. Lewis Chalkor
Steuben	Cohocton	Mrs. Raymond Crouch
	South Pulteney	Mrs. Dorothy Gibson
St. Lawrence	DeKalb	Mrs. William Thornhill
	Mt. View	Mrs. Ella Paro
Suffolk	Sound Ave	Mrs. Nina B. Hallock
Tompkins	Caroline	Mrs. Clinton Mulks
	East Lansing	Mrs. Lucie Holden
	West Danby	Mrs. Carlton Hunt
Warren	Glens Falls	Mrs. Lillian Van Dusen
	Mohican	Mrs. Helen Steves
	Mountainside	Mrs. C. N. Morse
	Stony Creek	Bortha Hill
Washington	Battle Hill	Frances Wood
	Cambridge Valley	Mrs. Ellis Bailey
Wyoming	Attica	Mrs. Robert F. Glor
	Castile	Mrs. Olin Hotchkiss

Here It Is!

The New Small FARMALL with "Culti-Vision"

"Culti-Vision" gives you a clear view of your work, while you sit comfortably in the roomy sponge-rubber upholstered seat. Row crops can be cultivated cleaner, with less damage to the crop and with fewer field stops, when you ride a FARMALL-A with "Culti-Vision." Direct-attachable planters, cultivators, etc., are available for corn, cotton, and all other row crops, including truck and garden vegetables.

FARMALL-A FEATURES

- ① "Culti-Vision"—You can see your work.
- ② Comfort—No neck craning, no body twisting. Sponge-rubber upholstered seat. You can drive comfortably, sitting or standing.
- ③ Four-speed transmission—2 1/4 to 10 miles per hour. Variable governor—you can control traveling speeds within "inches per hour."
- ④ Valve-in-head 4-cylinder engine with Tocco-hardened crankshaft, full force-feed lubrication.
- ⑤ The small all-purpose tractor with replaceable cylinders.
- ⑥ High-grade ball and roller bearings at 29 points 15 rawhide spring-loaded dust and oil seals.
- ⑦ Adjustable wheel tread—40 to 68 inches. Ground clearance, 21 1/2 inches.
- ⑧ Most complete line of direct-attachable machines.

SPECIAL EQUIPMENT is available to meet every requirement. Tractor at left is shown with electric lights, belt pulley and power take-off, adjustable drawbar, front and rear wheel weights, and adjustable front axle.

Here is power farming NEWS every farmer has been waiting for:

International Harvester announces the NEW McCormick-Deering FARMALL-A—the *smallest* Farmall ever built—a *rubber-tired* combination of modern power and efficiency, at a new low Farmall price!

Seventeen years ago Harvester engineering produced the *original* McCormick-Deering Farmall. Nearly half a million Farmalls followed in the swift march of all-purpose power. Now the *pace setter* sets a new pace—with FARMALL-A—tough little brother of the famous Farmall line!

Visit the McCormick-Deering dealer and get acquainted with the

powerful go-getting FARMALL-A. Get into its upholstered seat and at the controls, take a ride on its rubber. See what that great new feature, "culti-vision," means. That's one to start with!

A word of advice to the man who needs the new FARMALL-A—the *supply will not be plentiful for some time to come*. Get your order in early for a true Farmall, beautifully designed to do all the work on the small farm, or to replace the last team on the big farm. Catalog about the FARMALL-A and its complete line of direct-attachable machines will be sent on request.

INTERNATIONAL HARVESTER COMPANY
(INCORPORATED)
180 North Michigan Avenue Chicago, Illinois

MCCORMICK-DEERING
FARMALL A

Effect of Price Fixing Upon the Production of Milk

By LELAND SPENCER

COMMISSIONER Noyes and others have expressed concern lest dairy-men step up their output of milk so much that prices will again be driven down far below a fair level. Reinstatement of the Federal and State orders for the New York market assures about a 20 per cent increase in farmers' returns for July milk. How much increase in production should we expect because of these higher returns? This question cannot be answered definitely because the output of milk depends upon so many conditions that cannot be predicted. However, we do have some basis for estimating the effects of price changes on milk production.

Dr. M. S. Parsons, who was one of our recent graduate students at the New York State College of Agriculture, found that most of the ups and downs in deliveries of milk to the dairy plants of this State can be explained by changes in milk prices and feed prices. Of course, the weather, condition of pastures, yields of feed crops, removal of diseased cattle, and income from other farm enterprises also have some effect upon the milk flow, but New York farmers seem to be guided in the management of their herds very largely by the prices received for milk and the prices paid for feed.

Dr. Parsons found that farmers make both short-time and long-time adjustments in milk production when the ratio of milk prices to feed prices rises or falls. The short-time adjustments are made by feeding more or less grain, and by either selling or holding back some low-producing cows. These short-time adjustments usually have the greatest effect upon the deliveries of milk in one to four months after the prices have changed. For example, an increase in milk prices for July would have the greatest effect on production in August. On the other hand, November prices have considerable effect upon production in the following January, March, April, and May. If there were no striking changes in the other conditions that affect the output of milk, a 20 per cent increase in the July price would probably bring 2 or 3 per cent increase in August production.

The longer-time adjustments that farmers make because of changes in milk prices and feed prices have a greater effect upon the milk supply. These long-time adjustments are made by raising more or fewer heifers and by shifting the time of breeding. No doubt the importation of cows from other States would be an important factor, too, were it not for the restrictions that are imposed for the control of cattle diseases.

It takes about two years for these long-time adjustments to show up in the form of larger or smaller production of milk. It seems that farmers pay more attention to the ratios of milk prices to feed prices for August and September, and for February and March than to those for other months. Probably the reason is that the fates of the largest number of calves are decided at those two times of the year. If prices are favorable, more than the usual number of heifer calves is saved to be raised for dairy cows. When

these extra heifers freshen about two years later, the milk flow will be increased unless unfavorable weather, heavy slaughter for disease control, or some other factor should intervene.

Judging from past experience, if the 20 per cent increase in milk prices should hold through August and September, and through the following February and March, the stage would be set for a substantial increase in milk deliveries by 1942. If other conditions were about normal, the increased output of milk, due to higher prices, probably would amount to 4 or 5 per cent.

This does not sound like an alarming increase, but unless the consumption of fluid milk and cream should be stepped up also, the result would be a dangerous expansion of the volume of surplus milk. Moreover, according to the findings of Dr. Parsons, continuation of the higher price for another year would likely bring another 4 or 5 per cent increase of output, and so on. Obviously the higher prices for milk cannot be maintained unless other prices also rise, or unless some effective scheme of production control be worked out and accepted by the farmers.

Milk Receipts at New York

Of the 3,316,752 cans (40-qt.) of milk received in the Metropolitan market in May, 2,014,237 came by truck; New York State supplied 2,098,321 cans or 63 per cent of the total; Pennsylvania 556,073 cans or 17 per cent; New Jersey 478,188 or 14 per cent; and the balance came from Vermont, Connecticut, Massachusetts and Maryland. May 1939 receipts were 5.4 per cent above May 1938. The total receipts for the first 5 months of 1939 were 0.8 per cent above the corresponding period in 1938.

Cream receipts of 176,017 cans in May represent an increase of 8.2 per cent over May 1938, while the total for the first 5 months of 1939 was 4.1 per cent above the corresponding period of 1938.

Veal Calves Market Milk

When milk prices are low, the use of milk to feed veal calves will often bring better returns than shipping surplus milk to market. J. D. Burke of the N. Y. College of Agriculture has some interesting figures on the value of milk for veal calves.

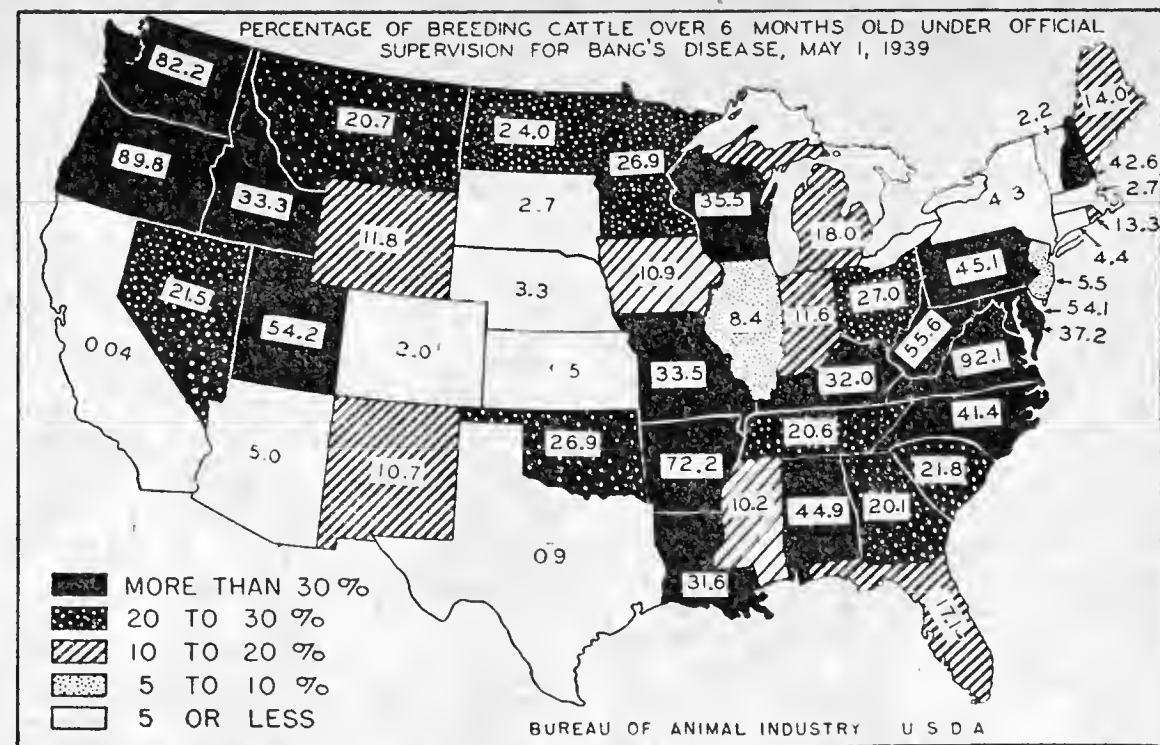

Mr. Burke states that on New York State farms there are at least 700,000 calves available for vealing each year, and that if each calf were fed 750 lbs. of whole milk, they would use half a billion lbs. of whole milk annually. Also, the use of milk in this way might well increase the demand for veal because of the better quality of veal marketed.

The returns for fattening veal calves depend on the price of veal, the price of milk, the size and kind of calf to start with, and the size and quality of the finished calf.

If a 100-lb. bob veal calf costs \$4 and the price of veal at the farm is 10c a lb., whole milk on the average is worth \$1.80 to feed calves.

If you can buy a 100-lb. bob veal at \$2, the following figures show the value of milk at the different prices for veal: at 6c a lb., milk would be worth \$1.13; at 8c, \$1.60; at 10c, \$2.07; at 12c, \$2.53.

Even if you have to pay \$5 for a bob calf and sell the veal at 7c a lb., milk fed to the calf is still worth 97c a hundred, which compares favorably with the prices received by many dairymen for April and May milk.

This map shows the percentage of breeding cattle over 6 months old which were under official supervision for the control of Bang's disease on May 1. It shows substantial gains since a year ago, with greatest progress in the states of Alabama, Arkansas, Delaware, Georgia, New Hampshire, North Carolina, Oklahoma, Oregon, Pennsylvania, South Carolina, Virginia, Washington and West Virginia.

In New York State on May 1, 81,706 cows were under official supervision, which is 4.3 per cent of the total. However, a considerable number of N. Y. S. dairymen have had private blood tests to determine the situation in their herds.

In New Jersey, 10,070 cows are under supervision, which is 5.5 per cent; and in Pennsylvania, 572,845, which is 45.1 per cent.

Western New York Field Day and Bull Sale

THE Third Annual Western New York Dairy Field Day and Bull Sale is to be held at the Hamburg Fair grounds on July 29, 1939. This will be an all-day affair beginning at 10:30 in the morning (Standard Time). This field day is sponsored by a group of twelve Western New York counties, and a committee headed by Mr. Orson Helms, of Cattaraugus County, has arranged a varied and entertaining program. Mr. Walter Rosenbach, of Erie County, is chairman of the bull sales sub-committee. The county agents of each county involved are very active in promoting this field day. Over 75 bulls are being consigned by breeders in this area, not only as possible sales but as advertisements of superior breeding stock.

Mr. Jim Hays of Michigan State College, will speak. Mr. Hays is an extension dairyman, the former Holstein secretary of the Michigan Holstein Association, and owns and manages a farm of his own in Michigan. Mr. Hays will have for his topic "The Form and Function of the Dairy Cow."

There will be many exhibits, machinery displays and interesting sidelights to please everyone. The Fair Grounds have many tables and benches, fireplaces and other facilities to enjoy a picnic dinner. This day promises to attract several thousand farmers and their families, giving them entertainment, a chance to make valuable contacts and to take a well-earned one-day vacation.

Fruit Condition Promising

Each year about the first of July the State Department of Agriculture, co-operating with the State Horticultural Society, issues a report of fruit crop conditions. The following table shows the percentage of a full crop for several varieties of apples in several areas as reported by Horticultural Society members:

District	All	Baldwin	McIntosh	Greening	No. Spy	Ben Davis
Northeast	94	—	94	—	100	—
Western	76	64	71	67	52	71
Eastern	66	53	75	60	41	63
So. West	57	50	50	48	10	—
South	30	50	80	90	72	—
So. East	68	44	70	58	46	69
Long Island	60	25	95	25	—	—

For PEARS, percentage condition of the crop is below last year. Clapp's Favorite and Seckel are relatively heavier in western New York than in

the Hudson Valley, and Bartletts and Kieffers are heavier in the Hudson Valley.

Generally excellent conditions prevail for PEACHES.

The PLUM crop was reported 57 per cent of full crop as compared to 51 per cent a year ago.

Both sweet and sour CHERRIES are giving heavier crops than last year, with sweet cherries relatively heavier in western New York.

Poultry

Estimate of shell egg holdings on July 1 was 6,985,000 cases, compared with 6,255,000 cases a year ago. For frozen eggs estimate was 137,970,000 lbs., compared with last year's figures of 138,510,000 lbs. Total stocks on July 1 a year ago were the lowest on record for that date.

The egg-feed ratio the last week in June was 8.8. A month ago it took 9.7 doz. eggs to buy 100 lbs. of feed, a year ago 7.2, and two years ago 10.2.

Top wholesale price of eggs in New York has recently been about 2c below last year. It probably would have gone lower except for purchase of some 250 cars of eggs for relief by the Federal Surplus Commodities Corp.

On June 1 there were about 3 per cent more chickens of this year's hatch in farm flocks than there were a year ago. On this basis, it is predicted that the hen population next January 1 will be little if any larger than it was on January 1, 1939.

On June 1 storage stocks of frozen poultry were 28 per cent higher than a year ago. Out-of-storage movement of poultry has been heavy, but is expected to slacken because market receipts of poultry are likely to be lower during balance of year than they were for the same months in 1938.

Wool

For the entire country, wool price to farmers on June 15 was 21.9c a pound compared to 18c a pound a year ago.

Imports so far this year have been larger than a year ago, but mill consumption has also been heavier and it is expected to continue high for the next few months, although perhaps not as high as for the first three months of the year. In the Southern Hemisphere the carry-over of wool into the 1939-40 season will be small, but stocks in importing countries will be fairly large.

Ford Presents New Tractor

If there is a small boy around, he will insist on doing the plowing, because the steering and all the controls of the new Ford tractor and its Ferguson unit implements are extremely light and simple to operate. Small plots and tight places can be worked faster and easier than with horses.

AT DEARBORN, Michigan, on June 29 a new Ford tractor was shown to 400 farm paper men, business leaders and other guests of Henry Ford.

The new tractor has a four-cylinder L-head engine, delivering 23 brake horsepower at 1400 revolutions per minute. At this engine speed the tractor has a speed of 2½ miles per hour in low, 3¼ m.p.h. in intermediate (plowing), 6 m.p.h. in high, and 2¾ m.p.h. in reverse.

To demonstrate the easy handling of the tractor in small space, a 20 x 27 foot enclosure was cultivated before the assembled guests without leaving a wheel mark on the surface.

The list price was announced as \$585 f.o.b. Detroit, equipped with rubber tires, battery and generator, self-starter, governor, oil bath air cleaner, muffler, power take-off, Ferguson system of hydraulic controls for all implements, streamlined radiator grill, fenders, instrument board, ignition lock, throttle control and independent brakes on rear wheels. Tread is adjustable from 48" to 76" on front and rear.

At a luncheon at the Dearborn Inn, Harry Ferguson, who developed the principles embodied in the new tractor and implements, spoke to the guests and explained the new principle used in attaching implements to the tractor, eliminating the necessity for excess weight to obtain penetration in the ground.

Weyerhaeuser Announces June Contest Winner—July Contest Now On

First Prize—\$250.00—F. S. Eveleth, M. D., 12 Court St., Concord, Merrimack County, N. H.

Second Prize—\$100.00—Chapman Dogan, Hudson, Summit County, Ohio.

Third Prize—\$50.00—William Roland Brown, Schenectady, Schenectady County, N. Y.

Fourth Prize—\$25.00—Robert Hettich, Towanda, Bradford County, Pa.

Fifth Prize—\$25.00—James L. Bartlett, Roundhead, Hardin County, Ohio.

Sixth Prize—\$25.00—Charles J. Smith, Martinsville, Clinton County, Ohio.

Seventh Prize—\$25.00—Mrs. R. L. Tarleton, 288 E. Fayette St., Uniontown, Fayette County, Pa.

The entry which won Mr. Eveleth \$250 was:

"What I like best about Genuine White Pine is—

its GRAIN is EXCELLENT—velvet smooth and free from resin;

its QUALITY is EXCELLENT—no danger of splitting;

its SURFACE is EXCELLENT—cov-

ers easily, economically, holds paint; its WEIGHT is EXCELLENT—it's strong, adaptable, versatile;

its PERMANENCE is EXCELLENT—proven by the homes of our pioneer ancestors, still standing in their splendid ruggedness;

its PRICE is EXCELLENT—for big and little pocketbooks, yours and mine. An outstanding product that stands out by its super-EXCELLENCE."

A similar list of prizes is offered for July, August and September. There is still time to enter the July contest. You can get an official entry blank and a booklet on white pine from your local dealer who handles Weyerhaeuser 4-SQUARE lumber. You can enter the three remaining contests and you can have as many entries as you want for each contest. You will find full details on page 3 of the July 8 issue.

ETHYL GASOLINE CORP. is conducting a series of gasoline engine clinics. One feature of unusual interest to those who attend is an automobile owned locally which, after adjustment by a mechanic, is tested right before the eyes of the audience. Rear wheels are placed on two rollers so the car can go 60 miles an hour without getting anywhere. The resistance of the rollers is electrically controlled to imitate the effect of hill climbing while the car is on the level. Gauges to show speed and temperature can be seen by the audience.

When a low grade of gasoline is used, the engine knocks badly while temperature rises and power decreases. A blend of several grades of "regular" gasoline cuts down on the knocking, reduces the temperature, and increases the power; while the use of Ethyl gasoline develops the most power, particularly if the spark adjustment is advanced to a point where full advantage of the anti-knock quality of Ethyl gasoline is used.

Opening night for one of these clinics was held in Elmira, June 19. It will be there several weeks and then will be taken to Rochester. If you have an opportunity to attend one of these clinics, don't miss it.

At the New York State Fair, to be held in Syracuse from August 26 to September 9, there will be an exhibit of aircraft and aircraft accessories. Says Director Paul Smith, "This, we believe, is the first aviation show of its type ever attempted in this country." The exhibit will be without cost to manufacturers of aircraft and aircraft accessories, all of whom have been invited to participate. A State Fair Aviation Committee has been named with Robert Fowler, Advertising Director of Aircooled Motors Corp. of Syracuse, as Chairman. Other members are: Harold E. Cobb, Eugene W. Walrath, James E. Walsh, Harry W. Ward, and Charles E. Flaherty.

NEARBY MARKETS for NEARBY POULTRYMEN

Pricing Nearby Eggs

By J. C. HUTTAR

I SUPPOSE some ambitious young social reformer could make a good case out of the system of quoting premiums on Nearby eggs by calling it "Another Great American Swindle."

Well, I hardly think he could convince me that the situation was as bad as that. I do believe, however, that there is a lot of kidding going on, though I doubt that there is any great amount of swindling actually being done.

J. C. Huttar

A fair and honest price report is supposed to say at what prices each of the important grades of the market change hands. In the New York city market I feel that this is fairly well done. I do feel, however, that the system of buying and selling eggs on ever increasing premiums brings out a weakness by which producers may be fooled for a time at least.

I'm going to repeat a statement that I have made here several times in the past on which I know I can get some argument if I want to look for it. This is the statement: *The right price is the best price for the producer.*

This may sound so simple that you might not get my point so I'm going further by adding that if an egg price is quoted too high—that is, above the right price—it's not good for the man who markets his eggs regularly in the market-place where this price has been quoted. Naturally, when an egg price is quoted too low it also hurts such a producer.

Let me give you my idea (remember, it's only one man's opinion) of what the right price is. *The right price on any particular grade of eggs at any particular time is the highest price at which practically all the eggs of that grade available at that time will find buyers.* It must be assumed, of course, that the folks who have these eggs to sell have a chance to contact a good number of the buyers who want such eggs and that such buyers have full opportunity to get at a goodly portion of the supply available—in other words, a broad and competitive market.

If trading has to be done at a level above the right price, buyers will soon switch to other grades or cut down their purchases because they cannot add what they feel is a satisfactory margin, and sell as many eggs as they could at the right price. Then some eggs in that grade go unsold for a time and sellers begin to cut prices to move them; but the damage that was done to that grade of eggs is in the fact that buyers and consumers are not immediately coaxed back to that grade of eggs by a lowering of price. There is a lag due to the fact that a buying habit is not quickly changed back and forth. Usually the low price has to prevail much longer to get buyers back on the grade than it took for the high price to chase them away. So, the net result is a loss to the producer whose returns are based on these price quotations.

I wanted to make this right price statement clear because it is the basis of any argument I ever advance on price quotations.

Nearby Quotations

You will remember that I laid a

foundation for Nearby egg quotations in the last issue. Now to build on that foundation.

Let's take white eggs first because we've got so many more to market.

Premiums Begin

Back in 1920 the quotation which is now called "Nearby and Midwestern Exchange Specials" was the highest quotation on large white eggs. There weren't enough finely graded, fancy quality Nearby eggs to base a quotation on. In 1924 a group of producers in the Vineland, N. J., poultry area formed an organization and as a group bargained with a group of wholesale egg dealers in New York City on this basis. They said, "We will take care to protect the quality of our eggs and will grade them according to these standards, which you approve of, if you will guarantee to pay us more money than we now receive for these eggs."

It was a good bargain, fair both ways, and so the agreed price was a 1c premium over the top quotations on "Exchange Specials" (they had a different name then) for the large white eggs. It worked well. The eggs improved. The call for these particular eggs improved and the price agreement has been revised several times until now it goes something like this:

From December 1 to June 30 of the following year a 2c premium over "Specials" for the large white eggs and top market quotation on "Exchange Mediums" for all the medium-sized whites.

From July 1 to November 30, a 3c premium on the large whites over "Specials" and a 1c premium on the medium whites over "Exchange Mediums."

Other groups of producers, and of late even individual producers, have made similar premium agreements with New York egg dealers, some for a little smaller and a few for a higher than the so-called Vineland premium.

Back in 1924, as soon as there were an appreciable quantity of these Vineland, N. J. eggs being traded in the market, the reporters recognized them with a quotation. Ever since then the price reporters have kept pace with improving quality and changing agreements by adjusting their so-called "Premium Mark" quotation on the large white eggs.

About five or six years ago a weakness in this quoting system became evident. This "Premium Marks" quotation was mostly a buying price so far as the egg dealer was concerned, while all the other quotations represented the prices at which the egg receiver or wholesaler sold eggs to a jobber or large retailer. So, to be con-

"Remember, Dear—drop us a line each night, and don't go on any wild parties!"

NEARBY MARKETS for NEARBY POULTRYMEN

More Summer Eggs By L. E. WEAVER

EGG PRICES have started up. Large eggs from the old hens will be more and more in demand. The pullet eggs will be a drug on the market. It seems to me that it is most important right now that we don't let anything slip in our management of the old bird flock.

L. E. Weaver

Professor Jones of Connecticut lists ten items that make up a complete program of good summer management. Better get your pencil and mark the ones that you have overlooked. Then tomorrow do something about it before a few more workers slip back into the ranks of the loafers and then have to be culled. Heavy summer culling usually indicates that management has not been up to par.

Many hens that might have been profitable layers have been sacrificed as culls only because of the ignorance, carelessness or neglect of their owner. That is what Professor Jones means by his first point. Here are the 10 points:

1. Avoid unnecessary culling.
2. Keep surroundings clean.
3. Keep the birds free of lice and red mites.
4. Feed for high mash consumption.
5. Have fresh water always available.
6. Limit the green food.
7. Keep the houses cool.
8. Break up broody hens at once.
9. Avoid moving and crowding.
10. Give lights after August 15.

I was in a laying house recently, and as I often do in hot weather, I started

to look on the under side of the roosts for red mites. The owner said, "You won't find any mites; I looked just yesterday." Sure enough, none were to be seen on the roosts themselves, but on the dropping board around the 2 x 4 legs that supported the cross pieces there were millions of mites. He had not looked very thoroughly. I'll wager that I could start out tomorrow and find red mites in nine out of every ten poultry houses in the Northeast. Unless a good red mite paint has been used liberally, they are almost sure to be there.

Extremely hot weather cuts down egg production just as much as extremely cold weather does. Those who are fortunate enough to have double-walled poultry houses, or pens with a straw loft or in the basement of a barn, can be thankful. The rest of us can only open up windows or doors on opposite sides of the pen to get all the air circulation we can and hope for a shower to cool the air.

High mash consumption is obtained by feeding wet mash once a day — morning, noon or evening, it doesn't matter. It does matter if too much is fed. It sours quickly in hot weather. That may or may not make the birds sick, but it is very likely to take the edge off their appetites. If you use skim milk instead of water to moisten the mash, the birds like it better.

I expect that the use of lights after the middle of August has a more direct influence than any other one thing on holding up egg production during late summer and fall. I have seen many flocks in recent years still going at a 50 per cent rate or better right up to December. Of course, such flocks are from bred-for-laying stock and have had the benefit of top-notch care all summer.

Notes on Culling

So much has been said and written about the benefits of culling one's poultry flock during the summer months that a good poultryman no doubt has a guilty feeling of neglected duty when he admits that he has taken out only a few birds. Yet he need not be ashamed. I am convinced that many good birds are sold every summer as culls just because they are not laying, and they were not laying just because of neglect or mismanagement on the part of the owner. A wise poultryman has only well-bred stock, and he gives it good summer care. He should have but few culls.

Good hens go out of production in the summer because of:

- (a) Broodiness.
- (b) Red mites or body lice, or both.
- (c) Overheated houses.
- (d) Insufficient mash consumption.

If any of these conditions exist in your flock, be sure to correct them; then give the hens a chance to come back before you attempt to cull.

A hen may be a low producer, but as long as she is in a laying condition, it is best as a rule to leave her in the flock.

We used to say to cull out all early molting hens. In these days of winter rearing, that rule no longer holds. Cull by the rate of molting. A rapid molter is a high producer regardless of when she sheds her feathers.

The catching crate is a very valuable aid in culling. If your hens are accustomed to being put through the catching crate, they won't mind it; but if it is their first experience, they may be so frightened that more damage than good will be done. Better do a quieter, though less thorough, job at night with a flashlight.

CANNIBALISM CONTROLS: Windowpaint, No-Pik. Specs, Pickards, Vent-shields. Get samples, prices. C. G. ROOKS, SIDNEY, N. Y.

build

now for high fall egg production, when prices are usually best, by feeding your pullets a mash rich in Vitamins A & D. These vitamins help them ward off disease and develop

huskier

bodies that will better stand the strain of heavy egg production. NOPCO X* Standardized Cod Liver Oil provides the uniform quantities of these vitamins that your

pullets

need to help them develop into profitable layers. The guaranteed potency of NOPCO X (1500 U.S.P. units of Vitamin A and 200 A.O.A.C. units of Vitamin D per gram) will assist you in getting better growth, better health, and better production...

feed NOPCO X

to your pullets in mill-mixed mashes or buy NOPCO X from your dealer for home use.

PICKLES *add*

Zest to a Meal

by
MRS. GRACE WATKINS HUCKETT

WHETHER MADE by the long or the short process, pickles have an appeal all their own. Only the freshest vegetables and fruits give a perfect pickle or relish, crisp, tender, firm and well spiced.

Too long waiting between picking and pickling gives hollow pickles. Too weak brine allows bacteria to grow which makes pickles soft or slippery. Brine should be 10 per cent to 15 per cent in strength. Too much salt or sugar or too strong vinegar causes shrivelling and toughness. It is better to start with a weak pickle mixture, then use a stronger one.

A brine or salt cure for vegetables gives the finest texture in a pickle. Four to six-gallon stone crocks with wooden covers 1 inch less in diameter are useful for this purpose. A piece of cheesecloth or muslin covers the materials after they are packed. A 4-gallon jar holds about $\frac{1}{4}$ bu. of cucumbers. The following is about enough to fill one such crock.

TO CURE CUCUMBERS

Wash cucumbers if dirty, but do not bruise. Pack in jar, cover with 10 per cent brine, made by dissolving 22½ ounces of salt in a little water and adding enough water to make six quarts. Cover with cheesecloth and the board or plate. Weight down to keep cucumbers well under the brine. On the following day add 1 lb. and 3 oz. of salt to maintain the strength of the brine. At the end of one week and of every succeeding week for five weeks, add $\frac{1}{4}$ lb. salt placed on the cover. This is to keep it from sinking to the bottom. Remove, by skimming any scum which may form from time to time. Four to six weeks will be required to complete the process of fermentation. Then melted paraffin may be poured over to seal the crock.

Fermented pickles need freshening before using, yet they will taste and keep better if not quite all the salt is removed. They are simply soaked in as many as three to five changes of cold water. Then they may be made into cucumber pickles or mixed with other vegetables for mixed pickles, mustard pickles or chopped for relishes.

After freshening, the pickles should be covered with a weak pickle solution made by combining equal parts of water and pickling solution. A good standard solution is made of 6 quarts vinegar, 6 ounces mixed whole spices and 3¼ pounds sugar. Heat the vinegar to boiling in an agate saucepan, dissolve sugar in it, add spices tied in a cloth bag, simmer for 5 minutes, let stand overnight with the spices. Sugar and spices may be varied to suit the taste, but too much sugar shrivels pickles.

After pickles have stood in the weak solution ($\frac{1}{2}$ pickle and $\frac{1}{2}$ water) they should be placed in the full strength solution in the crock. After standing 24 hours they could be packed into jars and covered with the last solution or in a freshly made one. In freshening, cauliflower and beans that have been brined need to be boiled in one or two changes of fresh water in order to make them tender. If onions are used, they are

added after other vegetables are freshened. Finished pickles should be processed in a hot water bath for 5 min. and sealed. Another fermented pickle is the dill:

DILL PICKLES

3¼ gallons medium sized cucumbers	1 pound salt
1 quart vinegar	10 quarts water
½ ounce mixed spices	Dill (stem, leaves, and seeds)
	Grape leaves

Cucumbers for dill pickles should be about 5 inches long. Wash the cucumbers and wipe them. In the bottom of a 4 gallon crock or jar, put a thick layer of grape leaves and over this a layer of dill and the spices. Pack the cucumbers into the crock and pour the mixture over the pickles to fill the jar. Put a layer of dill and then a layer of grape leaves over the cucumbers. Invert a large plate over the top of the pickles and weight it down to keep the pickles at least 2 inches under the liquid. Let the pickles cure from three to four weeks. Remove the plate, wash it, replace it over the pickles with the weight, and seal the crock with hot paraffin or pack the pickles into glass jars and seal them.

Green tomatoes as well as cucumbers make delicious dill pickles. However, most people like them better if $\frac{1}{2}$ cup sugar is added to the above pickling mixture. A temperature of between 75° and 80° is most favorable for the fermenting which should be complete in about 2 weeks—longer if the temperature is lower.

Slice the tomatoes, pack in sterilized quart jars with $\frac{1}{2}$ cup cider vinegar to each and fill the jar

A dish filled with a variety of well spiced pickles appeals to nearly everyone. In the article on this page, Mrs. Hockett gives clear and concise directions for making both long and short process pickles.

—Photo by Ewing Galloway.

with the dill brine which has been strained, boiled and cooled.

All pickles should be sealed airtight in glass top jars and stored in a cool, dry place. Some people even recommend processing all pickles for 5 min. in a hot water bath.

While the fermented pickles have a flavor and texture all their own, many of us can be happy with the results of short process pickles.

CORN RELISH (4½ pints)

18 ears sweet corn	2 onions
1 small head cabbage	1 tb. celery seed
4 green peppers	1 tb. white mustard seed
2 red peppers	1 qt. vinegar with enough
2 cups sugar	water to cover mixture
½ cup salt	

Cook corn on the cob, chop cabbage, onions and peppers which have had their seeds removed. Remove corn from cob and cook with all other ingredients 20 to 30 min. or until clear. Seal in sterilized jars.

MUSTARD PICKLES

1 pint small cucumbers	1 pint small green tomatoes
1 pint large cucumbers, sliced	1 pint cauliflower (cut in small pieces)
1 pint pickling onions	3 red peppers (chopped)
1 cup string beans (cut in ½ inch slices)	3 green peppers (chopped)
	1 cup small carrots (sliced)

Soak tender vegetables in brine (1 cup salt to 1 gallon water) overnight. Drain; soak in clear water 3 hours. Mix equal quantities of vinegar and water to cover. Let stand 1 hour, heat to simmering. Make a dressing by mixing:

1¼ cup white sugar	1 teaspoon celery salt
4 tablespoons flour	4 tablespoons powdered mustard
½ tablespoon turmeric	

Add 3 pints of hot vinegar slowly, stirring to make a smooth paste. Cook over hot water until the sauce thickens. Drain vegetables thoroughly. While hot, pour the mustard (Turn to Page 21)

It's Time to Preserve

By M. LUCILLE FORD.

It's time to preserve
The fruit of the tree,
The fresh garden dainties,
The berries so free;
In pantry or cellar
On cold winter days
What a treat they will be!

It's time to preserve
The flash of a wing,
The perfume of blossoms,
Each gay flowering.
In the mind's treasure chest
During dark stormy days
What joy they will bring!

for sunback dress; 3¾ yards of 39-inch material and 6 yards of ruffling for evening version.

FROCK PATTERN No. 2918 is especially slenderizing for the larger figure. The V-neck, blouse fullness, and pointed waistline, add height, grace and dignity. Sizes 16 to 50. Size 36 requires 4 yards of 39-inch material.

TO ORDER: Write name, address and pattern size and number clearly and enclose 15c in stamps. Address Pattern Dept., American Agriculturist, 10 North Cherry St., Poughkeepsie, N. Y. Add 12c for a copy of our new summer fashion catalog.

Today in Aunt Janet's Garden

Know Flowering Habits

SPEAKING again of watering—roses as well as other plants need it, but it should be done early in the day. This helps to prevent the spread of mildew. Massey dust or one containing sulphur and rotenone or arsenate of lead will help to control both black spot and mildew on roses; it needs to be applied regularly—just about once a week.

At times we have to curb our zeal for keeping all old flower heads cut off. Occasionally some plant objects. The Blaze rose for instance. New flowering lateral branches develop from the old flower clusters; hence if they are cut off there will be no new flowering laterals. It pays to know the flowering habits of climbing roses particularly.

On the other hand, the wisteria needs harder cutting back than it usually gets. In fact, in many cases this is given as one probable reason for lack of bloom. This is a good season for pruning it. I have even heard of root pruning being practiced in order to get bloom. This is done by cutting around to the depth of a garden spade about two feet from the parent stem of the vine—all depending on the size of the vine of course. For some strange reason this "shocking" treatment seems to throw the plant into flower, yet there are stubborn cases where nothing seems to avail.

Many of the campanula family, peachbells, Canterbury bells, etc., will furnish a second supply of blooms if the first ones are clipped off when they fade. And don't forget to remove all seed pods and old flower heads from the rock cress, iris, peonies or other early flowering plants.

I am trying a suggestion which I saw in *Horticulture* a short time ago about how to get new plants from my daphne cneorum—that sweet little evergreen with delightful pink clusters of flowers in May. First make a little slit in the underpart of a branch and cover it with 2 inches of soil. After roots are formed around the slit, cut the new plant away from the parent and transplant. I know this works with deutzias and other shrubs, so why not with daphne?

SHE STICKS TO THE "TRIED AND TRUE" PECTIN... CERTO!

WHY 3 OUT OF 4 JELLY CHAMPIONS STICK TO CERTO:

1. Certo is the "tried and true" pectin that takes the guesswork out of jelly-making!
2. Certo alone gives you 79 recipes—a separate tested recipe for every fruit!
3. Certo reduces boiling time to ½ minute for jellies—only a minute or so for jams!
4. Certo jellies retain fresh fruit flavor—no "boiled-down" taste!
5. Certo gives you half again more glasses—makes all fruits jell perfectly!

Look for the tested recipes under the label of every bottle of Certo—a product of General Foods.

Says Mrs. K. E. Harris whose jams and jellies made with Certo won 6 first prizes last year at the Wyoming State Fair.

Insist on CERTO

THE ORIGINAL "TRIED AND TRUE" PECTIN THAT TAKES THE GUESSWORK OUT OF JAM AND JELLY MAKING.

MUFF — A Serial Story

By C. A. STEPHENS

IN JUNE Muff had a very strange experience and came near losing his life through the malice of a workman whom he had, after long provocation, discharged for drunkenness and those kindred misdemeanors which often accompany that vice.

As is common in such cases, the fellow vowed to be revenged; and as he continued to reside with a family living near the factories, his spite was easily evinced in various mean acts.

Muff was a practical machinist, and attended to all repairs of his mill machinery in person. It happened one day that the turbine water-wheel of the pulp-mill had become damaged by a log of wood being sucked down the "well" which fed it. Wishing to look to it before the next day's work began at seven o'clock, Muff went to the factory at five o'clock in the morning, before the water was turned on for the day.

As he entered the building, he discovered Castman, the disorderly operative, standing on the dam. Indignant at what had already occurred, and suspecting that the fellow was out thus early for no good, Muff spoke to him rather sharply and warned him not to trespass on the property in the future.

Castman made an insolent reply, but walked away; and Muff thought that he had left the premises.

He then went down to the waste-way under the mill, but finding that he could not reach the cause of the stoppage from below, came up into the sluice-house, and then by means of a small ladder, descended into the "well" over the waterwheel.

This well was a circular tube four feet in diameter, made of strong sheathings, banded with iron hoops, and set perpendicularly over the waterwheel. It was fifteen feet in depth; and the top of it was flush with the sluice-way above. The water flowed into it at the top and stood in a column of that height on the wheel. Great power was thus obtained, for the descending column of water pressed on the wings of the wheel with an undeviating weight of five or six tons.

Muff had got down to the wheel and

had been for some minutes trying to loosen the block of wood with a small iron bar and haul it out with a hook. While thus employed, a slight noise in the sluice-house overhead attracted his attention. He stopped to listen, and next moment the sharp click and creak of the gate-wheel came to his ear—followed instantly by a deluge of water!

Castman, the dastard, had stolen in, and finding that the proprietor was at the bottom of the "well", had yielded to a sudden murderous impulse to kill him by turning on the water.

Having hoisted the gate, Castman slipped out and ran away. He probably thought that no one would suspect him, or could at least prove anything against him, and that Muff's death would be set down as an accident.

Meantime what of Muff?

The moment he heard the click of the cogs of the gate-wheel overhead, he knew his danger, and instinctively dropping the hook, leaped to the rounds of the ladder. Down came the water, like a cataract, upon him. It nearly crushed him; but knowing that his life was at stake, he clung to the rounds of the ladder and had presence of mind enough to hold his breath.

Fortunately, the water-wheel did not start; he had not yet got the clog out. Had the wheel started, it would have broken the ladder to pieces and sucked him down. Exerting all his strength, he raised himself (for the water to some extent rushed through the wheel) round by round on the ladder.

In describing his sensations afterwards, he said that it seemed as if he were raising not only his own weight, but "that of a barrel of flour on his head and shoulders" in addition, and he thinks he was nearly a minute in getting up the ladder. At last he got his head out at the top and drew a long breath of relief.

The fact of Castman's guilt was pretty surely indicated by his flight.

For four years from the date of his return to the Corners from the Reform School, Muff continued to live in the little brown cottage, on the doorstep of which he had been found when a baby, and which old Marcia had left

him at her death. On the fifth summer he had a very handsome country house built on the site of the old cottage, and he has since had the grounds about it fitted up very beautifully.

Some of the neighborhood gossips think that he is not going to live there alone much longer; in fact, that there is a lady in the case, the daughter of a wealthy paper manufacturer in an adjoining state. But as Muff himself has never said a word of this to me, I deem the rumor mere idle gossip, or at least none of my business at present.

Something much more to the point, which ought to be of interest to many, is the provident scheme which Muff has invented to secure the permanence of the pulp and spool manufacture here, and thus guard both himself and his help against any break-up in the business through exhaustion of the stock of wood.

First he consulted several gentlemen from various parts of New England who are interested in forestry and proficient in that science. Then instead of allowing the lands from which the poplar and white birch for the mills is taken to be cleared, he has begun to purchase these lands, and allows the growth to spring up again at once. Under certain conditions of the soil, the land is first lightly burned over, then left to itself again. In the course of twenty years, these lands will have thus produced another "crop" of wood, fit for cutting. As the extent of these lands is considerable, the business can, by this wise foresight, be perpetuated.

This brings our account down to present time. In spite of the misfor-

The Amateur Poet's Corner

Loved Acres

Ours is such a little farm,
With just its share of sky,
Of fertile fields and wooded hills,
And pastures bare and high.
The mighty trees that grace the place
And frame the glorious dawn,
Have watched o'er us these many years,
Indeed, since we were born.
Loved acres, few but very dear,
God grant we never part;
Thy will be done, but oh! we hope
That You may have it planned
To let us live forever
Upon this bit of land.

—M. L. A.,
Massachusetts.

tunes of his birth, his mistakes and the bad name which followed him, Muff has succeeded remarkably well.

The best of life is still before him; and he is making a fortune in one of the best of all ways, namely, the application of inventive talent to the manufactures and solid business of the country.—*The End.*

I Go To Church in Penn-Dutchland

(Continued from Page 1)

numerous flock of babies was just perfectly behaved. As a matter of fact, very frequently one of them would break into a wail and then would promptly be taken outside to be comforted. Thus it was that there was an almost constant traffic up and down the aisles. Under such conditions my sympathetic heart fairly ached for the preacher, but I must say that he did not seem greatly to mind it. Doubtless he had had so much experience and was so well seasoned that the interruption troubled him less than it did me. One thing is certain. As long as these Pennsylvania Dutch folks continue to believe that agriculture is the finest exemplification of the Good Life, Lancaster County farms will continue to be always in demand at inflated prices. I am sure that in this congregation there is a Future Farmer of America born at amazingly frequent intervals.

This church maintains a Sunday School that in no definite way was different from what might be found in a rural church anywhere, except that there was a multitude of classes. I joined myself to one of these made up of men, like myself no longer young, and I found the experience a wholly pleasant one. I did not go upstairs to the primary department but was assured that there I would find a hundred youngsters of very tender age. I know that when the School was over, these came tearing downstairs in a solid phalanx and had a great time getting themselves reunited with their elders. When the hour for service arrived, the great sanctuary was a solid mass of people, filling the pews and seated in chairs in the aisles. From my vantage point near the front and on the side I looked the crowd over. The men in their black clothes seemed to me to typify a substantial, dignified, intelligent citizenry—the type of men that you would expect to be the proprietors of the splendid farms that lay all around us. And the women—each one with the white head dress covering her hair—seemed placid and con-

tent and overflowing with kindness and cheer.

The church was abundantly supplied with hymn books but there was no musical instrument. Suddenly a man stepped forward directly before and below the pulpit and raised his hand and at the signal, as with one voice, the vast congregation burst into that perhaps stateliest of all hymns:

"Holy, Holy, Holy, Lord God Almighty,
Early in the morning our songs shall
rise to thee."

From the very beginning music has always been an important part of the Mennonite Church Service and these folks have been trained to sing without instrumental accompaniment. There were two more hymns, neither of them familiar to me but both of the same dignified, stately sort as the first one. I am so glad that they did not sing one of those cheap—perhaps I had better say vulgar—hymns such as "He walks with me and He talks with me, And He tells me I am His own"—an example of perfectly meaningless words carried by a lilting melody.

I am not going to say anything concerning the sermon. In manner and content it was very much like what might have been heard in a thousand other pulpits that morning.

I am only echoing the words of a million other men when I say that measured by our mastery of the forces of nature, we may be the wisest people that ever lived but we have made a miserable mess of civilization. In a day that has the possibility of giving the abundant life to all men in a measure never before dreamed of, we have made international relations a nightmare of hate and fear and we have want and hunger in the midst of abundance so great that there seems to be no room to contain it. I submit that in a world where the rulers and the wise wander in confusion and doubt and great darkness, these peace-loving Mennonites of the Pennsylvania countryside have found the answer and the way out.

The Song of the Lazy Farmer

THE World's Fair got Mirandy Jane all jittery, time and again she's propositioned me to go with her to take in that there show. So I've decided to give in, perhaps 'twill quiet down her chin, at any rate the die is cast and she will have her way at last. I sold a cow to git the dough, so all that's left is just to go; I bought a trailer, second-hand, to help cut down expenses, and we'll have our kitchen and our bed right with us all the time; instead of worryin' all night for fear that our hotel bill will be dear, we'll park and slumber in content and not pay anyone a cent.

The kitchen ain't so very big, it couldn't be in that there rig, but Jane Mirandy ain't so fat; no matter where we may be at when meal time comes she'll git to work and fry potatoes in a jerk. It's kind of nice to have our home right with us where'er we may roam; while Jane Mirandy

cooks the hash I figger we'll be savin' cash, them profiteers can make a fuss, but they won't git rich off'n us. We'll park beside the Fair and eat, and when the arches in our feet begin to hurt we'll amble back and go to bed in our own shack. We'll see the wonders of that Fair, we'll see the girls a-dancin' there; that is, I will, come sunshine or come rain, if I can ditch Mirandy Jane!

By CHARLES M. GARDNER

Editor of the National Grange
Monthly and High Priest of De-
meter of the National Grange.

THE OUTSTANDING Grange event of the year in New York State took place on the evening of June 26 at Chapel Corners Grange in Dutchess County, when the President of the United States and his wife, Mr. and Mrs. Franklin D. Roosevelt, were guests of the evening, and a Silver Star certificate, denoting 25 years of continuous membership in that subordinate Grange, was presented to the Chief Executive. A large number of Patrons from Dutchess County and vicinity witnessed the unusual event—the first time in all Grange history that any award of any sort has been presented by this organization to a president of the United States.

The formal presentation was made by Deputy Ethan A. Coon of Rhinebeck, to which President Roosevelt heartily responded, while Mrs. Roosevelt added greetings and good wishes. Both expressed high appreciation of the part the Grange is playing in building a better America, and following the formal program of the evening a social hour was enjoyed, when all were given an opportunity to greet the evening's honor guests. Both Mr. and Mrs. Roosevelt seemed to enjoy the occasion as much as any of the assembled Patrons. Chapel Corners Grange is located but a short distance from the President's estate at Hyde Park.

JULY 5TH will be a long-remembered day in New Jersey Grange circles, when Patrons from every section of the state journeyed to Three Bridges to join in celebrating the golden wedding anniversary of State Master and Mrs. David H. Agans. Nearly all the state officers and deputies were present, as well as a large number of rural leaders, state officials and other prominent members of the various groups of New Jersey activity, with which State Master Agans has been long identified. The occasion was a very happy one, with numerous gifts left to remind the worthy couple of the exalted place they hold in the love and esteem of a far-flung circle of friends.

THE GRANGE in Rhode Island is about to lose one of its prominent figures in the resignation of Dean Paul S. Burgess of the State College of Agriculture, to take a similar position of much larger scope with the University of Arizona. Dean Burgess, a native of Rhode Island, has done a splendid work at the State College and has taken a prominent part in all Grange activities. He is the son of Rev. Gideon Burgess of Greenville, former Chaplain of the Rhode Island State Grange and 86 years of age, who is tenderly designated throughout the state as "Rhode Island's grand old man of the Grange."

IN MAINE, an event of much significance has just taken place in the retirement of Mrs. Kate B. Ellis of Fairfield as director of the Grange Cottage for Girls at Good Will Farm, a position which Mrs. Ellis has held for many years and in which she has rendered a wonderful service to the hundreds of girls who have enjoyed the benefits of the Grange Cottage. She is succeeded in that responsible position by Mr. and Mrs. Allison P. Howes of Pittsfield, Mr. Howes a former lecturer of the Maine State Grange. Mrs. Ellis

also has a remarkable record of years in the position of deputy of the Maine State Grange over a long period, one of the few New England women who have thus been commissioned.

PREPARATIONS are rapidly making for the annual lecturers' conference of the Middle Atlantic States district, scheduled for August 15-18, at State College, Pennsylvania. Mrs. Ira C. Gross, Pennsylvania State Lecturer, is in charge of arrangements, and among the scheduled speakers will be National Master Louis J. Taber, National Lecturer James C. Farmer, Mrs. Harry B. Caldwell, National Juvenile Superintendent, and many educational and rural leaders from different states.

ONE OF THE GRANGE veterans of Connecticut is Hart E. Buell of Hebron, who recently passed his 84th birthday and who takes just as much interest as ever in all that is going on in Grange circles. Mr. Buell, familiarly known in his section as "Uncle Hart," was an important factor in the organization of Hebron Grange 33 years ago and is one of the ten living charter members. He has served as master three different times, a total of ten years, besides filling other Grange

Those who in the morning
When it was early
Made pathways
Across my heart,

On their way home
In the cool of the evening
Will pass
This way again.

offices, having been installed to some official position in Hebron Grange on 25 separate occasions.

PENNSYLVANIA loses one of its most conspicuous Grange figures in the death of Mrs. Georgia M. Piolet of Towanda, who for a half century had worked untiringly for the upbuilding of the Grange. For many years she headed the Home Economics Department of the Pennsylvania State Grange and was honorary chairman at the time of her death. It was largely through her influence that the money was raised a number of years ago for erecting the State Grange dormitory for girls on the college grounds of the State University, the first housing quarters for girls built on the campus.

JUNE 30 at Hampden, Maine, saw an unusual Grange event carried out by Eastern Star Grange, No. 1, the first subordinate ever organized in Maine—

the dedication of a hall provided exclusively for the Eastern Star Juvenile unit. The latter has been running scarcely more than a year, but has developed such an aggressive work that better quarters in which to carry it on seemed imperative. An abandoned stable, once very useful to a Grange, but no longer needed, was extensively remodeled, fitted up in modern shape with a compact auditorium, anterooms and other conveniences, and is now given over entirely to Juvenile purposes. Besides all the volunteer labor, the cost to Eastern Star Grange was about \$1200 in cash and the June 30th event was made a formal dedication occasion, using the regular service provided by the National Grange and conducted by State Master F. Ardine Richardson.

Pricing Nearby Eggs

(Continued from Page 16)

sistent the price reporters quoted the selling price of these "Premium Marks." This was done first for the large whites, calling the quotation "Resale of Premium Marks," and later for the medium whites, calling the quotation "Resale of Heavier Nearby Mediums." To bring this right up to date, last year a "Resale of Heavy Nearby Pullets" was also quoted on the pullet grade of white eggs. I don't think the last two are well named, for while net weight per case is considered, superior quality is the main thing buyers will pay these higher prices for.

Brown Eggs

The commercial brown egg producing industry is not so well developed, so that we have no such definite premium structure on eggs of this color in the New York City quotations.

I said earlier in this discussion that I considered the present premium structure on white eggs a weakness because the premium for one grade and quality of eggs is based on what a lower grade sells for. But since the demand for and supply of the better eggs is not always in so definite relation to the demand for and supply of the lower, the "Premium Marks" quotation does not always represent the right price. Sometimes it is too high and at other times too low. For this reason brown egg quotations more nearly reflect the right price on the different grades.

As I pointed out last week there are "Exchange" grades of "Specials" and "Mediums" for brown eggs, the same as whites. But Nearby, well graded, higher quality, large browns have a quotation according to sales value entirely independent of the quotation on "Brown Specials." This quotation is called "Nearby, Extra Fancy, Heavy Browns." There aren't enough fine medium sized Nearby Browns on the New York market yet to justify a quotation on them. But it may come.

I have seen the top quotation on large Browns as much as 10 cents and

Melodies Within

By CAROLINE M. LORD.

From spreading junipers along
My path a warbler's fragile song
Awakens melodies within,
That but for love had never been.
We linger'd once to hear a warbler's
song.

as low as 1/2 cent above "Brown Specials." As near as the reporters could interpret sales facts I think these represented the right prices.

The Poultry Industry

Before I meet you again in print the poultrymen of this United States will have shown their colors and their strength by uniting with others in the industry who supply them with materials for production and means of marketing, in staging the greatest agricultural event in the history of this country.

I refer to the Seventh World's Poultry Congress which will be staged in Cleveland, Ohio from July 28 to August 7.

The poultry industry needs unity badly. Will you do your share to boost your industry? I'll be looking for you.

* Described in the last issue.

Pickles Add Zest to a Meal

(Continued from Page 18)

dressing over and simmer for 5 minutes. Pack into hot sterilized, glass jars and seal tightly.

Other short process pickles are represented in the following favorites of "H. R.'s."

Easy Sweet Pickles

1 gallon cider vinegar 1/3 cup ground mustard
1/2 cup salt 1 teaspoon saccharine

Stir these ingredients in a sterilized 2-gallon crock. Pour boiling water over small cucumbers, let cool and wipe perfectly dry without breaking the skins. Add to vinegar, keep crock closely covered. Cucumbers may be added a few at a time as picked. Pickles good to eat in 10 days. H. R. (Ed. note: This recipe is useful for diabetics who cannot take sugar).

Old Time Sour Pickles

1 gallon sharp vinegar 1 cup ground mustard
1 cup salt 1/2 cup mixed pickling spices

Stir well in a crock; add clean medium-sized cucumbers, cover with horseradish leaves and a weighted plate. Let pickles stand for two weeks before using. This gives a sharply sour pickle whose spicy tang is especially liked by men.—H. R.

Rosebud Pickles

Cook tiny beets until tender; skin and add to following pickle: Scald 2 cups sugar, 2 cups vinegar and 2 cups water; cook 5 minutes after beets are added; add 1 clove, sliced garlic and seal in sterilized jars. H. R.

Vitamin Relish

1 small head cabbage 5 red peppers
8 large carrots 12 large onions
5 green peppers 1 bunch celery

Chop vegetables coarsely. Mix with 1 cup salt and place in colander to drain 1 hour. Add 1 quart vinegar, 2 pounds sugar, 2 tablespoons mustard seed and 1 tablespoon celery seed. Pack cold in sterilized jars. We use this to mix with salad dressing to make a crisp homemade sandwich spread. H. R. (Ed. note: Also excellent for perking up potato salad).

Favorite Relish

Cook in water to cover bottom of pan, 4 quarts chopped green tomatoes, 6 red peppers and 6 large onions for 5 minutes. Add 1 1/2 quarts vinegar, 1 quart sugar, 1 tablespoon tumeric powder, 1 tablespoon celery seed and 3 tablespoons white mustard seed. Cook together 15 minutes and seal in sterilized jars. Good with baked beans. H. R.

"See here, George — there is nothing in this instruction book about it."

Kernels, Screenings and Chaff

By H. E. BABCOCK.

FOR SEVERAL YEARS I have been writing intermittently about certain developments in Northeastern agriculture which seem to me to be sound and to lead toward a better standard of living on farms. These developments are:

(1) *The replacing of expensive permanent fences with cheap, movable electrified fences.*

This change is not only saving farmers expense for fences but is tending to bring about a better utilization of the natural grass production of the Northeast.

(2) *The mounting of farm equipment on inflated rubber tires.*

This adaptation is just getting under way. When it is carried out to its ultimate conclusion it will give farmers redesigned farm equipment with better bearings and more adequate lubrication systems, equipment which can be moved about readily and can be worked at higher speeds without undue breakage. An indirect result of the introduction of this kind of equipment will be to stimulate the farming of non-adjacent areas of farm land by competent operators who own the "means for farming".

(3) *The introduction of grass silage.*

Again this is a development which leads toward a better utilization of the natural grass production of the Northeast. The challenge in this connection is to develop ways of making grass silage which will eliminate, so far as possible, any cash outlay by Northeastern farmers.

(4) *The spread of farm electrification and a result of such electrification which a few months ago no one foresaw.*

I refer to the individual farm quick-freezing and cold storage box.

* * *

Winter Barley Okay

We threshed our winter barley the week of July 2. As nearly as I can compute the yield we got about 30 bushels of grain to the acre. This will not seem like a large yield to farmers living in good grain-growing sections. In view, however, of the extremely dry weather we have had around Ithaca all the spring, and the dry field on which the barley was grown, I am well satisfied with the crop we got.

I especially liked the way this particular strain of winter barley stood up even in moist places. It was also much nicer to handle because the awns are not barbed. By the 8th of July we not only had the crop harvested and threshed, but had ground up several bags as a base for a home-made hog ration.

While I have no intention of plunging in winter barley, we shall grow 10 acres next year. I am sowing this 10-acre field this fall not only because I feel reasonably sure of getting a good crop of grain, but also so that I

This year most of our small grain at Sunnysables is on small ill-shaped hilly fields which we are seeding down for permanent pastures. Under these circumstances combining did not seem practical, especially since some of the fields are all of two miles from the barn and we must have the straw at the barn for bedding and poultry litter. Accordingly we leased a threshing machine and made the set-up shown in the picture immediately above. Three men operate it. They thresh the grain, chop the straw, and

blow it into the lofts of the barns through the dormer windows. Two men and a boy draw the bundles to the thrasher. They dump their loads as shown in the picture at the top. The extreme top of the load falls off in some disorder but the balance slides out of the truck without disturbing the way the bundles are loaded. THIS IS ANOTHER JOB ON WHICH OUR GRAVITY DUMP TRUCK PROVES TO BE A BIG TIME AND MONEY SAVER.

may have the crop available to mix in with green clover and alfalfa to make grass silage about the middle of June 1940 if I elect to do so.

Whether I shall try the latter stunt or not will depend, as I have already reported here, on how the grass silage comes out which I have made this year by mixing volunteer wheat and winter barley in with legumes and using a minimum of phosphoric acid. So far as grass silage is concerned, we at Sunnysables know that it is great stuff and that it fits admirably into Northeastern farm practice. We further know, at least so far as we are concerned, that we have got to make grass silage in some manner which will keep our cash outlay for purchased acid or molasses to the absolute minimum if we are to continue to put it up.

* * *

Turkey Cycle

To a member of a Department of Agricultural Economics in a State College of Agriculture the term "turkey cycle" can mean only one thing. To me, however, it has come to mean something entirely different.

"Turkey Cycle" at Sunnysables

means a turkey for Sunday dinner every two or three weeks the year around. So far, our cycle has been entirely theoretical, but we still have hopes.

On today, July 12, there were delivered to us at the farm 60 cross-bred turkey poults. They have been put in the room where we raised 55 turkeys last summer, and, when I saw them an hour ago, they were as bright and chipper as could be. They have come so late, however, I'm afraid they won't be ready to eat much before early November at the best.

If such turns out to be the case, we're going to fall short, just a little, of completing our "turkey cycle" this year, because I've just looked out in our farm zero storage box and find that we have only four frozen turkeys left on hand. Under the circumstances, it looks as though we're going to have to ration these birds out one-a-month.

If the poults we have just put in do well, we plan on eating what we want of them fresh during November and December and quick-freezing about 25 for the rest of the year. This should be enough to give us a complete cycle of turkey diet during 1940. Incidentally, our family has come to prefer a

quick-frozen turkey to a freshly killed one.

* * *

Teamster Gossip

Last spring we bought a pair of mules. We have had them long enough now so that we can draw some worthwhile conclusions as to their usefulness.

When we first brought them home Jake said he would be darned if he would drive the "blamed things." I noticed, however, later that he was glad to fall back on them to relieve his beloved Silver and Gold from some of the hard spring work. Then the boys took them over to Larchmont farm.

After they had been over there awhile, Howard volunteered the remark that Jake was all wrong in his attitude toward the mules—"that the trouble was Jake tried to drive 'em, whereas the only practical thing to do was to follow them." At the end of one of the hottest days last week, I asked Ross, who had been driving or following and steering the mules all day, what he thought of them.

A big grin broke over his face, and he said, "They sure can take it." And so we'll let Ross' summing up stand.

SERVICE BUREAU

MEMBER
AMERICAN
AGRICULTURIST
PROTECTIVE SERVICE

Conducted by H. L. COSLINE

Handling Baby Chick Complaints

WE ARE always glad to handle complaints from subscribers who feel they have had unsatisfactory treatment from baby chick hatcheries advertising in *American Agriculturist*. We cannot, however, handle complaints against hatcheries that do not advertise in our columns. I am sure you will agree that such complaints should be made to the publication that carried the advertisement.

It is important, if you wish prompt handling of claims, to deal with firms advertising in a publication that carefully investigates its advertisers and refuses to take those with reputations for shady dealings.

It is equally wise when you order your chicks to say, "I saw your advertisement in *American Agriculturist*." When this is done, there is no question on the part of the hatchery operator that we are within our rights in asking for his side of the story and in demanding an adjustment if the situation warrants it.

When dealing with *American Agriculturist* baby chick advertisers, you are certain to get your chicks or the return of your money. If any advertiser fails in business before shipment is made or for any reason cannot ship chicks, we guarantee that your money will be refunded.

We expect every hatchery to stand back of statements made in its advertising and at all times to meet subscribers half way in settling differences of opinion.

Unless a statement is made to the contrary, a hatchery is not responsible for chicks that die after a customer has received them. In order to maintain the good will of subscribers, many hatcheries will make a special offer to replace dead chicks at a reduced price.

Baby chick buyers should understand that the statement "breeders blood tested" is not an absolute guarantee that chicks will not have pul-lorum. Freedom from this disease is more certain when hatcheries advertise that breeding stock "has been tested until no reactors are found."

It is only after careful thought that we have decided that we cannot handle baby chick claims against non-advertisers. To insure that your complaints are handled sympathetically but fairly, we ask that you buy from our advertisers and that you say, "I saw your ad in *American Agriculturist*."

It Didn't Work

YOU will be interested in the experience one of our readers had with a correspondence school. Two years ago he signed a contract to take a course and gave the agent \$5.00. Before he received any lessons he wrote the company telling them that he could not take the course. A clause in the contract said it couldn't be cancelled. Two lessons were received and returned, and at intervals letters were received asking for the regular monthly payments. Finally in April our subscriber received a summons telling him to appear in a New York City Court to defend action taken by the correspondence school to collect the full cost of the course.

It seemed only fair to us, if the correspondence school wished to sue, to take action in the subscriber's own county. We contended that the action was brought in New York City with the idea that the subscriber would feel it impossible to appear to defend the action, and therefore, that a judgment would be granted by the court.

We put our subscriber in touch with a reliable New York City attorney who advised that a "Change of Venue" should be requested; in other words that the action be transferred to our

subscriber's own county. This was done, and the request was granted. Motion by the school's attorney for a summary judgment was denied, the contract declared illegal and void and court expenses were assessed against the school.

This may mark the end of the case. The school can sue in our subscriber's own county but they may not.

The Service Bureau does not make a practice of advising subscribers to break contracts although we can understand how the unjustified and unauthorized statements of agents may tempt the subscriber to do so. We are glad that we were able to be of service in preventing the securing of a judgment without an opportunity for the subscriber to defend his case.

This incident points again to the importance of checking with the company about rosy statements made by the agents, as well as determining with certainty your ability to pay for the course and to profit from it.

* * *

What's the Answer?

"I shipped a 30-dozen case of large white eggs to a firm in Jamaica, New York, and received a check for \$3.21. I have been shipping to another firm and received .19 per dozen. The eggs I shipped were gathered twice a day and kept in a cool place, and were shipped on a cool, rainy morning. A letter from the firm said that the eggs were heated and that was why they brought so low a price."

Well, here is the story and from it you can draw your own conclusions. Regardless of who is right in this case, it is certain that no eggs should be shipped to any concern until the party is checked as to reliability. We are always glad to do this and have definite information on the moral and financial ratings of firms that have been in business for some time. This is not always available on egg receivers who have just started in business but frequently there is a record of other concerns for which the members of the new company have worked.

* * *

What to Do in Case You Are Involved in an Auto Accident

1. Stop your car immediately.
2. If your car cannot be easily seen by other motorists, if possible move it well off the side of the highway.
3. Leave your car near the scene of the accident until an officer arrives.
4. Give the injured all possible aid, but when a person is seriously injured, don't move him, as you may cause further injury. Send for a doctor, who will supervise the moving of the injured.

5. Make your identity, license and registration number known to the operator of the other car, at the same time make a note of his license, registration number and name and address.

6. All accidents where a person is injured must be reported to the police and the Motor Vehicle Bureau. If you cannot obtain correct accident blank to fill out, write your State Motor Vehicle Bureau.

7. If you damage an unattended vehicle, you are required to locate the owner and give your name, or report to the nearest policeman. Failure to do this is the same as leaving the scene of an accident.

* * *

We received your letter and check yesterday. We appreciate your help very much and wish to thank you for it. To show my appreciation, I will always be a subscriber to *American Agriculturist*. I am sure that many more would be if they knew of the service on which they could depend.—A. S.

John Thompson says—**“HERE’S
ONE MEETING
I WOULDN’T MISS”**

“You have a date with G.L.F.,” reads the invitation to the Patrons’ Annual Meeting which will be held at Greene, N.Y. on July 26. John Thompson says he’s going to keep that date.

GOOD HAY CROP IN SPITE OF DROUTH

Because their farm is on a hilltop and the hard-pan is several feet down, dry weather affects the Marshall Brothers’ farm near Ithaca, N. Y. as much as anyone’s. They know the importance of raising an increasing amount of feed for their cows right on their land. To accomplish this they gave superphosphate an important part in their operations a number of years ago. Winter grains receive 300 pounds of 20% and 2 pounds per cow per day are used in the stable. Ten loads of this superphosphated manure are equivalent to 1 ton of a 5-7½-5 mixed fertilizer.

“It sure has paid us during this dry year,” says Herbert Marshall. “I hate to think what the hay would have been like without this treatment. First cutting alfalfa was good, but when the dry spell came right after that we began to worry. However we cut about 1½ tons of good clover hay to the acre on the wheat ground.

“How do I know that superphosphate helped out? Well, down on one corner of the wheat field our man made a mistake and put on an extra dose of superphosphate. You could see where he went to a line when the clover started up. It was twice as tall as any other place. This little mistake reminds us that we were lucky to have superphosphate in the grain drill and in the top dressing this year.”

“It’s worth a few hours of every farmer’s time to keep control of an organization like G.L.F. in his own hands,” says John Thompson. “I feel I owe it to myself and my neighbors who use G.L.F. to go to the patrons’ meeting. This is one time of the year I can find out how our business is getting along. And I think I should do my part in seeing that the committeemen we elect are well qualified to watch this cooperative business of ours.”

Mr. Thompson is well qualified to speak on this subject because he has attended every meeting since his local cooperative service was established at Greene, N. Y., eleven years ago. He was one of the original G.L.F. stockholders and an early car-door agent. He can remember a time when \$12 retail margins on feed were not uncommon.

“It’s been different since G.L.F. came into the field,” he says. “A man has time to do a lot of thinking when he is riding

a hay rake or sitting on a milk stool. I’ve done some thinking and come to some conclusions in the 60 years I’ve been on a farm. I believe the cooperative movement is an effective means of solving many of the farmers’ problems. When we figure it up at the end of the year, we find the advantages of dealing with our own business are always in our favor. That’s why I put nearly 100% of my purchasing through G.L.F. To do any different would be the same as if I built a sawmill down here on Page Brook and then hauled my logs somewhere else to have them cut.

“There is another thing we older fellows have to look out for,” Mr. Thompson believes, “and that is the younger man coming into the farming business like my son, Bob. He must be shown somehow that patronizing his local G.L.F. Service is really trading in his own business in order to maintain standards of quality and price for raw materials he needs to run his

farm. I’m farming 160 acres here—poultry and dairy—and Bob is going to have to do most of the operating from now on. He must learn that the G.L.F. is one of his farm tools—just like his hay rake or his tractor.

“I’ve supported this business all through the years we had to pay for it and you can be sure I’ll continue now when I’m getting the benefits of it.”

AMERICAN AGRICULTURIST

A Hoosier Farmer LOOKS AT NORTHEAST FARMING

By I. J. MATHEWS

LATELY I have had a long-sought opportunity to make a study of the forward-looking practices of a number of extraordinary dairymen.

On Helmhurst Farm in Cattaraugus County, N. Y., owned by Orson and Katherine Helms is a Guernsey herd of 87 head that reflects what superlative care means to a herd. Here is a story that has a lot of inspiration in it for young breeders. It is no secret that Katherine Helms gives the herd her personal attention, both at home and on the fair circuit where she has become well known. Her cattle give her competitors something to shoot at.

In 1929, she bought five purebred cows and a little later a purebred bull. That first sire was carefully picked and he's still on the farm, not in some bologna casing. And this blonde gentleman has become the greatest proven sire in New York, bar none. Twenty tested daughters have improved their dams' records by an average of 8,178 pounds of milk and 532 pounds of butterfat!

Mrs. Helms is letting gravity save a lot of brawn. On a recently purchased farm, there is one of those high barns that butts right up against a hill so they are planning on a two-story dairy barn with a third story devoted to poultry.

He Hired Electricity

Arthur J. Black in Erie County is one dairy farmer who has a nice den—a cozy room with a stove in it, rugs of his own tanning on the floor, and a number of good books. When the

Buttermilk Falls State Park, one of the beauty spots of the Finger Lakes region. You will find it near Sunnysables, the farm of H. E. Babcock.

shafts of the west wind are tossing the snow flakes about, Black can snuggle down into his big chair and read, plan for his next deep sea fishing trip or program the following spring's activities in his sugar camp. Black has mastered what many of us might well emulate, how to disassociate himself from his dairying for a few days and thus galvanize his mental batteries.

A few years ago when electricity first came down his pike, Black invited it in with the statement "Plenty to do and long hours guaranteed". Many electrical assignments on his farm have been metered so he knows that it costs him just 2 cents to cool a can of milk in summer. He uses a 7½ horse power motor to turn his hay chopper and silo filler and it costs but four cents for power to chop a load of green hay into the silo. You would scarcely believe that it only costs him \$10.00 for the electricity with which to fill his three silos.

Freezing Farm Products

I was also impressed with some data and ideas gained from Francis Blake who orchards and dairies on 225 acres of land in Orleans County, as an avocation to the presidency of the big cold storage plant in Waterport.

"Freezing foods isn't what it used to be" Blake told me. "When meat and vegetables freeze slowly, the cell contents separate and when the water freezes, the crystal ruptures the cell and the food is ruined. But now with equipment where the product can be put in a temperature of 50 degrees below zero RIGHT NOW and frozen instantly, there's no separation; in fact, you can take a piece of meat frozen that way and thaw it out and it will be just as good and keep just as long as any

fresh meat. He showed me a household refrigerator that freezes products quickly, with a compartment where they can be later stored for indefinite keeping.

"Kernels"

H. E. Babcock of Sunnysables farm in Tompkins County, who can summon a succession of original ideas about as fast as any man I've ever met, also made a contribution to this important business of refrigeration on the farm. He showed me a cold box that will hold 500 pounds of farm products with a refrigerating unit at the end. Looking ahead, Babcock believes the time will come when farmers can take their products such as Angus steaks, Barred Rock broilers, and hot-house lambs to a central refrigerating unit, have them frozen quickly, then take them back home and store them in one of these cold boxes at a very low cost and at the same time make it possible for the family to feast on their home-raised fresh vegetables, fruits, and meats the entire year.

The economy of this mammoth cold box depends upon getting into it not oftener than once or twice a week, removing the ice cream, fresh raspberries, and chicken and putting them in the kitchen refrigerator. The cost of refrigeration of the big box can then be kept very low and there is a strong probability, according to Babcock, that the big units can be rented at an unbelievably small price per month.

Starkdale Holsteins

I approached Starkdale, tucked in between the Fishkill Mountains north up the Harlem Valley from Pawling, (Turn to Page 7)

WHEN IT'S 100° IN THE CORNFIELD

—YOU'LL BE GLAD YOU BOUGHT
AT THE ESSO SIGN!

THE day's a scorcher... but farm work *must* go on! How about the machinery? Will the lubrication stand up under high temperatures? Or will it thin out and expose metal working surfaces to friction and sure damage?

The question is answered safely... in advance... when you buy lubricants for all farm machinery at the Esso Sign. For behind that sign stands the world's leading petroleum organization, on which generations of farmers have relied for dependable farm fuels and lubricants.

Follow their example! Insist on getting petroleum products that will safeguard hard-working farm motors under toughest conditions of weather or work... protection that often means an *extra* margin of profit. Your nearby Esso Dealer is always ready to supply your needs promptly and cheerfully. Talk over your fuel and lubrication problems with him. He'll gladly help you to get the *most* service out of your equipment... at lowest cost. Make it a habit to drive in at his Esso Sign... for petroleum products, tires and batteries with a *lasting* reputation!

ESSO MARKETERS

COLONIAL BEACON OIL COMPANY

CHARLES M. GARDNER

Editor of the National Grange
Monthly and High Priest of De-
meter of the National Grange.

A PENNSYLVANIA Grange event of annual interest is the encampment and fair at Centre Hall, whose dates this year are August 24 to September 1, and with prospects of the usual immense crowd. Here will be seen all sorts of agricultural exhibits, a camp of more than 500 tents, and every field of farm and home activity, boys' and girls' 4-H Club, school projects, etc., thoroughly covered. The Centre Hall encampment and fair has been running since 1873, and was the particular pride of the late Leonard Rhone, past master of the Pennsylvania State Grange, and known in Grange circles as "the grand old man of the Keystone State." This year's plans embrace even wider activities than usual, and attendance is likely to run high into the thousands.

ST. LAWRENCE COUNTY, N. Y.,

Granges will put on a great rally day program and Church-Grange service at Gouverneur, on Sunday, August 13. It should draw one of the record crowds of the season in the Empire State. The exercises include morning attendance at the First Presbyterian Church, where the guest preacher will be Rev. George R. Harland, minister of the Scotch Presbyterian Church at Chipman and a long and active member of the Grange. Basket lunch at noon will be followed by the afternoon get-together, when the guest speaker will be the High Priest of Demeter, Charles M. Gardner of Springfield, Massachusetts, and other speakers and high-class musical numbers will complete the program. The churches and Granges of the community are heartily cooperating in making the August 13th occasion a great day for St. Lawrence County.

IN OXFORD COUNTY, Maine, at a meeting in West Paris the work of the evening was divided among several subordinates: One took charge of the tableaux; two others put on respective degrees; and still others furnished the program numbers. In spite of a terrific storm, 25 subordinate Granges answered the roll call, and it was a very enthusiastic occasion.

PISCASSIC Grange, No. 179, in Newfields, New Hampshire, awards cash prize every year to the child in each school in the township which makes the best mark for scholarship and citizenship, and there is always sharp competition to win the Grange prize. Awards have recently been made for the school year, and girls were winners in each case—future citizens indeed!

MASSACHUSETTS, Connecticut and New Hampshire have all had new Granges organized within the past sixty days, notwithstanding the general belief that these three states were about as thoroughly covered with Granges as possible. Other fields are under cultivation in each state, with results likely before the end of the Grange fiscal year, which is September 30.

MATTABESSETT Grange, in the city of Middletown, Connecticut, is occupying its new hall, and the members are very proud of their home. All con-

American Agriculturist, August 5, 1939

struction work is not completed, and the formal dedication will be an event of the early autumn.

WASHINGTON County Pomona Grange in Rhode Island awards scholarships each year to the high ranking Junior in the School of Agriculture at the Rhode Island State College and to the high ranking Junior woman student in the Home Economics course. These awards for 1939 have just been made and both fortunate students are members of Hope Valley Grange—Richard H. Bohning and Miss Kathryn M. Crandall.

ESSEX COUNTY, New York, staged recently a very successful Juvenile rally when several Juvenile units of the county presented the various features; these including conferring of the Juvenile Degree, tableaux and drills and a "flag and peace" program; the latter of very high order.

THE CELEBRATION of the 65th anniversary of Auburn Grange in Massachusetts was an event of more than ordinary interest; Auburn being one of the few subordinates in the Bay State whose existence has been actively continuous ever since it was organized July 2, 1874. This is the home subordinate of State Master Everett W. Stone; likewise of the veteran State Grange Chaplain, Rev. Albert H. Wheelock, who has served the Massachusetts organization in that capacity for more than 35 years. The present membership of Auburn Grange is more than 200, and for the first time in its six and one-half decades of life it has a lady master for 1939 — Mrs. Dorothy Warden, who is likewise this year's master of Worcester Central Pomona Grange.

IN ADDITION to their extensive collection of tinfoil for the benefit of the Shriners' Hospital at Springfield, Massachusetts, the subordinate Granges of Connecticut are busily engaged collecting books, dolls, toys, etc., to constitute next Christmas gifts for the children in the hospital. The Home Economics Department of Central Pomona, No. 1, in Connecticut has also presented a program of moving pictures and other enjoyable features for the benefit of the children in the same hospital.

ALL THE New England states, New

York and New Jersey will be extensively represented on Grange Day at the New York World's Fair, which has been set for Saturday, August 12th. The exercises occur in the Court of Peace building at 1:30 in the afternoon, with National Master Louis J. Taber presiding; brief snappy addresses by well known Grange leaders, and enjoyable musical and entertainment numbers making up the 90-minute program planned. That thousands of Grange members will be present is expected.

Copyright 1939, King Features Syndicate, Inc.

Chopped Straw for Bedding

J. SLOAT WELLES of Big Flats, Chemung County, N. Y., finds that chopped straw makes more satisfactory bedding. In previous years he found that the chaff tended to clog up the cutter and cause trouble. Being somewhat of a mechanical genius, he corrected the trouble.

As you see in the picture, the long straw passes over shakers which allow the chaff to rattle through. This chaff is delivered to the mow by the blower pipe of the separator, while the long straw goes through the cutter which is operated by an electric motor. The outfit works perfectly.

This farm has one of the best equipped farm repair shops in the state. Electric motors run various tools and there is sufficient room to do most repair jobs. In fact, machinery is remodeled as well as overhauled, and in his spare moments, Mr. Welles has done some wood work that would do credit to a cabinet maker. In addition to operating his fertile valley farm Mr. Welles finds time for a wide variety of community and farm organization activities.

From Maine to New York

IN A FARM YARD near Prattsburg, Steuben County, New York, stands a truck labeled "MacDougal Brothers, Caribou, Maine." Mr. MacDougal has put in 55 acres of potatoes. His brother is growing potatoes in Aroostook County, Maine, but if the Steuben County venture proves successful, you may see more Maine growers in Steuben County. In fact, they already have at least five in that area. One man is growing 150 acres. Several potato growers from Maine are planning to come to this area in August to look over the situation. They figure that they can grow potatoes in Steuben County, cut down on the long haul to market, and raise them on land which costs less and where taxes are lower.

These Maine boys are putting on a ton of fertilizer to the acre, using certified seed, and it is rumored that to grow the first year's crop will cost more than the amount paid for the land.

BELOW is a nice pair of colts raised by Victor Hurlbert of Grand Island, Vermont, and driven by Dana Hurlbert. The colts are brother and sister, three and five years old. Undoubtedly, there has been a big increase in interest in raising colts in the Northeast.

Hampshire Sheep

AT THE RIGHT is a nice bunch of purebred Hampshire sheep on the farm of Aaron Putnam of Steuben County, N. Y. Said Mr. Putnam: "They aren't in first-class shape, but it is a marvel to me that they have grown as they have when pastures have been so dry and poor."

Mr. Putnam has a dairy and raises beans and potatoes as cash crops. The dairy barn was once a tobacco shed. It is a bit narrow to be ideal for dairy cows but is substantial and adequate. It is interesting to observe the different uses to which tobacco sheds in this area have been put. Incidentally there is still quite an acreage of tobacco around Big Flats in Chemung County.

Pigs in Steuben Co.

HERE ARE a few of the 129 pigs on the farm of Claude Stowell of Campbell, Steuben County, N. Y. Mr. Stowell has a milk route in Corning, and became interested in pigs primarily because there is a cheese factory almost next door where he can get all of the whey he wants.

On the farm there are 35 brood sows, bred to farrow in September and October. Mr. Stowell started his pig business a year ago, and marketed a bunch in Buffalo which, at the age of six months, averaged 196 lbs. each.

The lot where the pigs now are is an alfalfa field, which is now pretty bare. The pigs will be moved to new pasture shortly. They get little grain until they are ready to fatten. They put on their gains by whey, and alfalfa, rye or vetch pasture.

Associates Honor President Thomson

E. H. Thomson.

ON JULY 17, friends and associates of E. H. Thomson gathered at Springfield to celebrate Mr. Thomson's twentieth anniversary as President of the Federal Land Bank, District No. 1, serving the Northeast.

Few men in agriculture or in any other occupation have as fine a record of service as does Ed Thomson. He was raised on one of those good Delaware

County, New York, dairy farms. After attending school and college, he worked in the Department of Agriculture at Washington, and then was appointed President of the young Land Bank at Springfield.

As a farm bureau agent in Delaware County, I well remember calling a meeting, in 1917, of farmers to form one of the first national farm loan associations. We didn't know very much about this new system of farm credit, but we did realize the great need for it. That that need has at least partially been filled in the Northeast is shown by the rapid growth of the Federal Land Bank in the twenty years that Ed Thomson has been a President. There are 12 of these banks in the United States, but in the Northeast alone the Springfield bank has loaned in twenty years, \$1,211,000,000 to 40,000 farmers on a businesslike but helpful basis. The business was built on the cooperative principle, with local loan associations. It uses the joint credit of farmer borrowers as collateral to back the Federal Land Bank bonds. The sale of these bonds to the investing public furnishes the money to make the loans to individual farmer borrowers.

Soon after the organization of the Federal Land Banks, the Intermediate Credit banks were formed, and more recently the Production Credit Corporation and the Bank for Cooperatives, all of which are doing a splendid job in supplying the credit needs of farmers.

Probably the great secret of Ed Thomson's success is the fact that he saw beyond the dollars to the folks themselves. Under his leadership, dollars were loaned to farm folks not as an end in themselves but in an effort to help that great army of farm families acquire homes, pay for them, and raise their families in the American tradition with a high standard of living.

Another fundamental principle of Mr. Thomson's success is his gift of choosing men not only for efficiency in their work but also for high character. High character of personnel, essential anywhere, is absolutely necessary in any credit institution. This character keynote of the Farm Credit system has built a confidence on the part of both farmers and those who buy the bonds that has kept the whole Farm Credit work marching on right through the depression.

Farm and Home Week at Amherst

TO FARM folks in New York and other states used to a Farm and Home Week at the State College of Agriculture held in the middle of the winter, it seems queer to think of

Farmers' Week in the summer time. Yet there are several state colleges of agriculture in the Northeast who hold this event in the spring and summer with 100 per cent results.

I am just back from attending Farm and Home Week at the Massachusetts State College at Amherst. During the same week Connecticut State College held this annual gathering. Many farm people come and stay the entire week. Some bring their tents or trailers and camp out. They make of it a week of vacation, relaxation and at the same time take home new knowledge and particularly new inspiration to carry on the old job.

What impresses me most in recent years at any of these Farmers' Weeks is the way farm people are reaching for more knowledge. The other day at Amherst I saw the crowds in the lecture rooms sitting for hours in the boiling heat, just "taking it" in order to learn better how to solve their problems.

Poultry Prospects

ON JUNE 30, 1934, it took 7 2/5 dozen eggs to purchase 100 pounds of feed. In 1935 it took 6 1/2 dozen; in 1936, 8 dozen; in 1937 10 2/5 dozen; in 1938 7 3/10 dozen and in 1939 8 3/10 dozen.

These figures are based on an average for four New Hampshire markets, and are printed by courtesy of the Intermediate Credit Bank of Springfield.

The question in every poultryman's mind is, "Will it take more or fewer eggs to buy feed for the remainder of this year, and for the next several years?" As one rides up and down this northeastern country he is impressed with the very rapid increase in the poultry business, particularly of farmers who go into it on a large scale. It is not so long ago when a poultryman who got a pullet to laying in December felt he was rather smart. But now the good breeders can make them lay almost any old time. Will this increase drive the markets down ruinously low?

Unlike dairying, poultry is easy to expand or contract, and a smart breeder watching the markets closely can cut down without too much loss when prices go down. It can be said also that feed prices at least for the coming fall and winter again promise to be very low. Record breaking crops of wheat and corn are in prospect. What the actual price for eggs will be is anybody's guess, and depends to a considerable extent upon whether or not employment and the resulting buying power of the consumer will increase this fall and winter. Consumers on the whole are eating more eggs than they used to, and enterprises like the World's Poultry Congress, now in progress at Cleveland, are all to the good from the poultryman's standpoint. Two figures that poultrymen watch are the number of chicks hatched and the volume of eggs in storage. This year about 20 per cent more chicks have been hatched than a year ago, and eggs have been going into storage more rapidly.

On the whole, for the breeder who watches his costs, the outlook is fairly good.

Will It Change Our Agriculture?

TWO WEEKS ago, returning from New England to Ithaca, I stopped in a neighborhood near Preston Hollow on the edge of Albany County, New York, where for several years farmer Leland Young has been growing birdsfoot trefoil. Highways leading to and from Mr. Young's farm are lined with fields of this wonderful plant with its little yellow blossoms.

Because of the work that Mr. Young has been doing, and that of Professor Johnstone-Wallace at Cornell and other scientists throughout the Northeast, interest in this new legume is spreading like wildfire, with small plots in many farm counties of the Northeast.

Because birdsfoot trefoil is a legume, it has the nitrogen-forming nodules and will improve the soil where it grows. Unlike other legumes, it will grow on sour soil without liming, apparently does well on poor soil, and is excellent for both pasture and hay. The fact is, it seems almost too good to be true. Birdsfoot trefoil must have its faults, but so far not many of them have been discovered. It may be that it will not do well on types of soil different from those in eastern New York, where it is now growing so abundantly. It may be that it will winter kill, and it is a fact that it is rather difficult to get it started. The seed, too, is expensive, costing around \$1 a pound. This, however, will take care of itself as the supply increases.

It is within the bounds of possibility that birdsfoot trefoil will in a few years be growing on the hills and valleys in the meadows and pastures across the Northeast farm country. If that should come to pass, it doesn't take much imagination to visualize a new day in this great dairy section.

If you have had any experience, good or bad, with birdsfoot trefoil, won't you write us about it so that we can pass it on?

We Need Men!

A FRIEND sends me the following statement, made several years ago by Senator Elihu Root, with the remark that the Senator probably did not realize at that time the extent to which what he then said would still be true today:

"God knows, we need men now! We need men whose trust is not in words, in rhetorics, in fine phrases, or in noble expressions of sentiment, but men, genuine, sincere, devoted; men who do not so much talk about their love of country, or their passion for liberty or humanity as men who do love their country and do love their liberty so much that they are willing to give liberty to others as well as claim it for themselves; men who think not merely of what they can get out of their country, but what they can give to their country; men who, upon the basis of clean, practical and sensible hard work in the ordinary affairs of life, carry ever noble idealism and a sincere capacity for self devotion."

A Good Place to Live

"The more I see of this Kentucky country, the more I appreciate our Northeast."—Doc. Roberts, Page 11.

I NEVER take a business trip through other sections of America that I don't come back feeling exactly the same way, and I don't think it is mere prejudice either. With all the problems we have here, the Northeast is one of the best sections in the entire world in which to live.

Eastman's Chestnut

DID YOU ever hear this one on Dean Arthur Deering, of the Maine State College of Agriculture?

Mrs. Deering, very sick in a hospital, was coming out of the ether after an operation. Naturally, her husband, who was very much worried, was by her side. As she opened her eyes, hazily, she murmured:

"Can this be Heaven?"

Then, becoming more conscious of her surroundings, she glanced at her husband, shook her head, and said:

"No, it can't be—there's Arthur!"

Youth SEES the WORLD

THERE are all kinds of ways of seeing the world, and too many of us are content to do it from the comfortable seat of an automobile. But more and more young people today—both boys and girls—are finding new delight and healthful activity in following the vacation trail blazed by the American Youth Hostel society.

No stuffy autos for them. They use Shank's Mare—their own two legs—or a bicycle. They carry a knapsack for extra clothing and eating utensils, a sleeping bag, wear an American Youth Hostel badge, and carry a pass to identify them along the route.

Routes they follow are laid out by the society, in beautiful and interesting regions of the country. The young travelers, or "hostelers" as they are called, cook their own food and when night comes they put up at places recommended by the society. These are called hostels, and are mostly farm homes whose owners act as "house parents" and chaperones to their guests. Mattresses, blankets, water, and a means of cooking a meal are provided by the hostels, and each hosteler uses his own sleeping bag to fit over the mattress. Regular rate for hostel accommodations is 25c a night, with a 10c fuel charge during summer for cooking meals. Some of the hostels are open in winter, also, for those who enjoy winter sports.

Before starting out on a trip, hostelers make their reservations for overnight stops, plan their entire route, and procure their badge and pass from American Youth Hostels, Inc., whose national headquarters are located in Northfield, Mass. Passes cost \$1.00 each for those under 21 years, and \$2.00 for those 21 or over.

Hostelers have several choices when it comes to how they shall travel. Some choose to go alone, but most of them travel in groups, either private or organized ones. If they wish, they can arrange for a leader or chaperon to accompany them; and at night, of course, when they reach a hostel, they are in charge of the "house parents" there, all of whom are selected by the American Youth Hostel society and are the finest type of farm people.

Distances between hostels are supposed to be a day's travel apart (about 30 miles for cyclists or less for hikers). The route is usually laid out in "loops", formed with the idea of including along the way historic places or beautiful scenery. Many of these "loops" are in our own Northeast, because it has so many interesting things to do and to see that are not too far apart. They range from Maine through the White Mountains to northern Vermont, thence southward through the valleys of Vermont and New Hampshire to Northfield, Mass. From there are chains of hostels to Providence, R. I., to Bridgeport, Conn., and Pawling, N. Y.

From Pawling or from Bridgeport, one can cross Long Island Sound by ferry to enter the Long Island loop, consisting of two hostels at Bay Shore and Rocky Point. Because of the World's Fair, these are particularly busy places this summer.

In Pennsylvania, there is a hostel loop which connects with New England across New Jersey and southern New York. Montreal, Canada, is con-

nected by a continuous chain of hostels to New England centers—Boston, Providence, Springfield, etc. New hostels are being set up all the time, and new "loops" mapped out. In Central New York, a Finger Lakes loop is planned, and a hostel has already been opened at Brooktondale, N. Y., 9 miles from Ithaca.

Besides the regular loops of hostels, there is the "Rolling Youth Hostel,"

—Photos courtesy of American Youth Hostels, Inc.

which goes on trips across the continent and to Mexico. It is a special car, equipped not only with the usual upper and lower berths and washrooms, but also with a kitchen. It is hooked to an express train, zipped across the country, and set down 500 or 1000 miles along the trail, to serve as a home to the 30 hostelers and their leaders while they take side trips on foot or on horseback or on their bicycles (which have been carried in the baggage car). There are no less than ten different Rolling Youth Hostel trips which can be taken, in the United States, Canada, and Mexico. In fact, there is no limit to where young hostelers can go. In Europe, where the hostel movement started ten years ago, they may be seen everywhere on foot and on bicycle.

Boys and girls, and young men and women, get a lot more out of these trips than just a chance to see the world. They learn to take responsibility, to be thoughtful for others, to meet emergencies as they arise, and they get a grand outing filled with exercise and fresh air. Before going on a trip, they are advised by the Society to go into training for it—learn how to choose food wisely, prepare it simply, and clean up neatly after a meal. Each hosteler, in starting on his trip, agrees to live up to the rules of the organization as to early bedtime, good conduct, etc. Otherwise his pass can be withheld by the house parent of any hostel where he stops, and he loses the privilege of using the facilities of the Society.

It is interesting to know that the American Youth Hostel organization is non-commercial. No one has any financial interest in its income from passes, sale of publications or other sources. The money it receives is used

Above: A New Hampshire house mother sees the youngest hosteler of the day off to a good start; the older ones look after themselves. Simple bunkrooms and cooking facilities keep work and cost down to the necessary minimum.

Left: Hostelers "cooking their own" in the kitchen of a Vermont hostel located in a school. Boys help too. Vermont hostels connect Montreal, Canada, with the World's Fair.

and is at present teaching school at Peru Central School. He has also been serving during the past two years as Assistant Scoutmaster and as a Merit Badge Counselor.—O. H. BENSON, Director of Rural Scouting, Boy Scouts of America.

For Sheep-Chasing Dogs

I recommend that the author of the article, "Dogs and Sheep" in your July 8 issue try a few Angus cattle as company for his sheep. He will find that dogs will leave them alone.

I stress the fact that the cattle must be Angus.

For further proof I refer you to Jerome E. Wright of Dorset fame.

—M. J. F.

Feed Horses More Salt in Summer

DURING the hot summer farm horses are frequently subject to very trying conditions. Very often at irregular times they are salted. Just imagine receiving your salt in one lump once or twice weekly. One of the most frequent causes of the excessive loss of weight and undue fatigue in horses is due, primarily, to lack of recognition of needed salt requirements.

Horses should be given salt at regular intervals and in addition, salt should be accessible at all times. A very satisfactory system is to keep a salt block on a stake in the field and in addition, provide a 4 lb. salt brick in each manger. If it is observed that the horse is not consuming as much as one ounce a day, then a tablespoonful should be added to the feed. Few farm animals will eat too much salt if given free access to it. They only do when salt has been denied to them for a time—then the salt-starved animal naturally eats too much. In many cases delicate feeders and shy drinkers will show increased appetite when allowed free and regular access to salt.

Some horses do not consume much salt and, consequently, will not drink much water. These are very difficult to keep in healthy condition and only by resorting to the above plan are they

(Continued on Page 11)

Early Sweet Corn

MR. CLARENCE HENRY, Eden, Erie County, New York, writes that he had sweet corn on July 8. Mr. Henry says:

"I planted about $\frac{1}{2}$ acre of Seneca 60 on April 24th and used no hotcaps. On the dates of July 7, 8 and 9 I picked this corn for a neighboring roadside stand, receiving 50 cents per dozen. On July 10th I picked 237 dozen for the market at Buffalo at 40-45 cents per dozen."

All right, who can beat that record?

* * *

In reply to Bruce Millard's record of having sweet corn on July 8th for table use, will say that we had all the corn we wanted for table use and we delivered 80 dozen to Krebs in Skaneateles for Sunday dinners.

The variety was Seneca 60, the same as Mr. Millard's, but the hot caps were not used.—GEORGE A. FRASER, Memphis, N. Y.

Scouts Forge Ahead

YOU will be interested in the activities of two boys, who as Scouts, were given the 4-A Award. Howard Ross of Lowville, New York, who won the award in 1935 has just completed the National Training Course for Scout Executives and has been appointed Field Executive at Middletown, New York.

Merton Bromley, who received the 4-A Award in 1934, has since that time graduated from Syracuse University

Going Down

By ED. W. MITCHELL

APPLES are going down. Down in consumption per capita; down in total acres in production; down in acreage being planted; down in value relative to competing products. What's the reason?

Time was when an apple was about the only fresh fruit available to the greater part of our population. In those days an apple was a thing to look for in your stocking at Christmas, and "fen the core" was a common cry when a boy appeared before the gang with an apple. In those days the rugged Ben Davis and Golden Russet were prized for their keeping ability and each grower figured on a dozen or more varieties to spread the season over as long a period as possible.

We all know that competing fruits and vegetables, improved refrigeration, transportation, and distribution have changed that picture permanently. We would not change back if we could. Those are a lot of conditions over which we have no control, and which should be allowed to take their natural course along the road of progress. I am not a believer in "controlled production" for the benefit of any group not able to compete on equal terms with the rest of the country.

There are, however, some factors in the problem of bringing apples back into popularity and a better price, over which the growers may have some legitimate control, and it is only good business sense for us to seek out those things and go to work on them. We have to work as a group, or industry to get anywhere these days, and we should get together on a program.

Good varieties, honest packs, orderly distribution over the market outlets and the season are the ABC of the lesson. We are familiar with A, have a speaking acquaintance with B, and nod at C but do little about it. D is the next letter we must learn, and I suspect the learning will be painful.

D stands for distribution, or method of selling, and I think it holds part of the answer to our problem of price and increased consumption.

When the apple crop was sold to the wholesale produce dealer or commission man in the Fall, or passed through his hands as the season progressed, every commission and wholesale house boosted apple sales and prices. Their money was involved. All the retail trade was bidding for the fruit in an open competitive market and prices were maintained. Now comparatively few commission houses invest in apples, or have many shipped to them on consignment. An increasing number of retailers and large users of apples make private contracts at the source of supply and so avoid the open competition of the market place. Each buyer that leaves the market place to buy at the farm reduces competition among buyers at the market by just that much. The city wholesaler is being constantly under-bid by the farmer who does not know market values. Is it any wonder we find it hard to sell a substantial lot of apples in the Fall or for future delivery, or that the commission men lose interest in our product? No. I do not want to speculate in apples; neither do you, if an unknown number of growers, holding an unknown amount of the commodity, are apt to cut loose whenever they need money or get scared of the market. To secure orderly and satisfactory distribution of any commodity, it must be in hands strong enough to hold through bad going, and directed by heads that know conditions.

Five hundred growers, each holding a thousand bushels of apples worth a dollar a bushel, are doubtless equal in financial strength to any one specula-

tor, because each one carries only a thousand dollars liability instead of the whole five hundred thousand. It is conceivable, and I think possible, to report crops, holdings, market destinations and prices so that those five hundred men can be kept well informed, and that the average of their marketing decisions will be about as good as the decisions of any one individual. But how are we going to get customers to bid against each other in the open, competitive market to establish and maintain prices?

There is no use trying to persuade us to give up sales to trucker dealers who come to the farm and pay cash. It is a cheaper and more satisfying way to sell than to ship on consignment. No grower can be persuaded to give up direct sales to a large consumer and let his commission man handle the deal and take out his commission. These avenues of trade are too pleasant and inviting to forego even for the future good of our industry. They are gradually beating down the price and cutting down on distribution but we will keep on doing it that way, just as we do lots of other things that we know lead to trouble. All we can hope to do is to stem the tide a little, and find correctives that will minimize the damage.

There are two things that offer some promise of help—advertising, and auction selling.

Every apple grower should contri-

Orange Co., N.Y., Onion Festival

TO FOCUS attention on their \$1,000,000 onion crop and to draw the community together for a novel celebration, growers and business men of Orange County's muck-land belt are planning an Onion Harvest Festival on August fifteenth in the village of Florida.

Similar plans had been made last year but the disastrous floods and heavy rains of late July and August washed away both crop and festival.

It will have a distinctly Old World character, this being natural as more than 90% of Orange County's onion growers are of Polish extraction, many of the original immigrants still being active in the fields. There is also a sizable community of Italian-American farmers and a slightly smaller one of those with German background. All of these, together with the few older American families still working in the muck-lands, will participate in the gay festivities of the celebration.

Heading the general committee as chairman is the Rev. Vincent J. Raith, pastor of St. Joseph's Church in

This is the month when apples through the night
Fall dully down upon the fecund earth,
When vines are drooping heavily with fruit,
And bees are drowsy with their honeyed girth.

This is the month when goldenrod stands tall
Near dusty roads, with Queen Ann's lace between,
A single golden leaf upon the wind,
A scarlet bough among the summer's green.

This is the month of hot and dusty noons,
Whose beauty is more deep than that of spring,
"Six weeks till frost, six weeks until a frost,"
Insistently the shrill cicadas sing.

bute, according to his ability and interest in the market, to a fund to promote the use of apples by advertising.

Every grower should pool a certain part of his crop to be sold at auction or at least through some public, competitive channel, to help that much in maintaining competitive prices, and to make public the market value of his fruit. Both buyer and seller are timid and hesitant if they are exchanging a commodity of unknown value. Trade for both will be better if values are established and well known. I can think of no more practical way to accomplish this than for the growers systematically to use the auction markets for that purpose.

Florida, while other chairmen are: the Rev. John S. Felczak, of St. Stanislaus' Church, Florida, pageant; John J. Nowak, Florida grower, motorcade; Orrin T. Pierson, farmer and writer for the Middletown Times Herald, publicity; John F. Miller, Florida, merchant, advertising publicity; Sylvester J. Krasiewicz, Pine Island postmaster, invitations; Stanley Meduski, Florida merchant, finance; Dr. Jesse D. Mars, Florida physician, Harvest Queen; Edward Turczyn, Florida grower, and John A. Hucko, Pine Island grower, harvest dance.

Opening the Festival, which will be staged in the afternoon, will be the motorcade which will take an estimated 200 decorated floats, trucks and cars on a 40-mile tour of all the communities in the muck-land area, including Goshen, Chester, Durlandville, Pine Island, Warwick and Florida.

Following will be an open-air pageant, staged on a specially constructed stage in a natural amphitheatre on a farm near Florida. Sixty-three young

A Hoosier Farmer Looks At Northeast Farming

(Continued from Page 1)

with a feeling of awe, for I know what sacrifice is entailed in keeping a number of cows on official test for three and four times a day milking for a month. But James Stark, all stark alone as it were, kept up this grind for four years and incidentally produced some world records that haven't been beaten up to the present.

One string he milked three times a day, one string four times and if you interlace those two milking schedules, you'll tumble that Stark's only free time during those months was from eleven at night until five the next morning. Under similar conditions, I'm afraid my hair would be grayer than his is and my smile would be much less ready. Yet after all, James Stark has that positive manner that I have always found in men who have made real accomplishments.

This man is farming 1200 acres now, 600 owned and 600 rented. I just couldn't resist the temptation to ask him if he thought that four year grind had been worth while and would he advise a young farmer to do the same thing. In answer to the first question, he reminded me that this testing was done just prior to the depression and perhaps in dollars and cents, it hadn't paid very big dividends but on the last question, he was positive.

"If a young dairyman had a herd of high testers and big milkers, I haven't a doubt but that it would pay him to pace them for a few months to get a measure of their efficiency of production."

A few miles across the state line at Lehighton, Pennsylvania, I found Robert Diehl, an unusually successful dairyman. Soft spoken, unassuming, you'd never pick Diehl out as a man who in his forties had, without outside help, accumulated 700 acres of land in one body and who had built up a dairy business that supplies the milk for six retail routes.

Fairyland Farms is positively one of the most beautiful farmsteads I ever saw, whether owned by millionaire playboy or "who have you". Diehl is an extensive advertiser, has 32 year-round men on his payroll.

Here is a dairyman who has taken a tip from other big manufacturers; he takes his products direct to the consumer. With meat animals—cows, heifers, and hogs to dispose of, he has developed a retail meat business which he carries on in the fall and winter when he isn't making ice cream. Orders come from newspaper advertising and the milk routes.

Diehl sure has a great collection of silos, ten of them and made from many different materials. It was with an irrepressible show of pride that he showed me three made out of tile staves. "You don't have to go to New York City to the Fair" he told me "to see the latest thing in silos. Right here are three just like the one exhibited there. I can't see how they can ever wear out for they are made of 100 per cent acid resisting material."

"I'm not saying I know where your glasses are, Grandpa, but if you put an ad in the paper, offering a reward it MIGHT bring results!"

LUMBER

The object of this contest is to acquaint prospective builders with the many good qualities of genuine White Pine Lumber.

Just read this free White Pine booklet. Reading time five minutes. Official Contest Entry Blank is included. Get one at your local Weyerhaeuser 4-SQUARE lumber dealer, or a copy will be mailed you. Use the coupon.

You merely complete this sentence. "What I like about genuine White Pine is"
(Use Official Contest Entry Blank)

Literary style will not count.
Here is an easy way to compete for one of the seven valuable prizes to be awarded each month for four months. Enter each monthly contest.

- 1st Prize \$250.00
- 2nd Prize 100.00
- 3rd Prize \$50.00
- 4th, 5th, 6th & 7th Prizes 25.00

The above monthly prizes are to be given in the form of a credit for the purchase of Weyerhaeuser 4-SQUARE Genuine White Pine to the amount of the prize, to build with now or later, or to cash in on. There are no strings to this contest whatsoever—you buy nothing.

Note: Your chances of winning are better as this contest is limited in area,—see contest book.

Ask any good carpenter and he'll tell you, "Everyone is acquainted with the beautiful light color of Genuine White Pine. And anyone who has even whittled a piece, is familiar with its softness, straight grain, and freedom from resin. You can saw it accurately either with or against the grain and it machines to a satiny smoothness. You can drive a nail into Genuine White Pine with little effort and it will stay put and hold hard. It is easy to paint or glue and for permanency can't be beat."

Yes, Genuine White Pine is the "bell cow" of soft woods—"the champion"—the favorite of all those who love its easy-to-work with qualities.

GET THIS FREE CONTEST BOOKLET WHICH TELLS BRIEFLY THE STORY OF GENUINE WHITE PINE. IT CONTAINS OFFICIAL ENTRY BLANK. ASK YOUR LOCAL 4-SQUARE LUMBER DEALER OR MAIL COUPON BELOW.

"A PENNY SAVED—"

How I Try to Cut the Cost of Producing Milk

By RALPH SPACE,
Tompkins Co., N. Y., Dairyman.

TO ME, the problem of reducing the cost of milk production to a minimum involves three factors and the failure of any one seriously hampers a dairyman in making a good living. These three points are:

The production of high quality feeds for the herd at low cost on the farm. The productive level of the herd as influenced by its breeding, disease control, and management.

The efficient use of labor and capital.

If you will pardon personal reference to my own farm, I will tell how I am trying to develop my own farm business with a view to efficiency in the future.

Most of us are farmers first, and dairymen second, and this is as I think it should be. First, we have the land to farm, then we have the crops to feed, and are therefore dairymen, as the dairy cow is so far unexcelled in turning our crops of hay and other low value roughages into a salable product.

Grow Plenty of Good Roughage

Inasmuch as her production responds to high quality feeds it pays to exert extra effort to produce large yields of varieties best suited for high milk production and growth of desirable replacements. Practices to this end at home have included liberal use of lime and superphosphate to fit the land for clover and alfalfa, and special care to cut all hay as early as possible to insure a high feeding value. I have tried to take full advantage of the Conservation Program to develop my pastures and the results have been gratifying. I am only using half as much acreage for pasture, yet I have more and better feed during the summer season. During the dry periods when grass refuses to grow in July or August, hay or silage is fed as a supplement.

My field crop rotation includes early maturing silage corn of a variety high in T. D. N., mixed with soybeans for silage, and small grains such as oats and barley as a nurse crop for alfalfa and clover. The last two years I have had enough experience with soy beans for grain to feel they are destined to have an important role in reducing our purchases of feed. I supplement these home grown grains with purchased ingredients, special attention being given to high quality, low cost nutrients, and variety needed to complete a ration for the herd. Minerals, proved by conclusive tests to be needed by dairy cows in this section, are also included.

Keep Cows That Can Produce

The dairy herd, itself, deserves more attention than it gets on many farms because, in it, we have the factory or machine to turn out our salable product. Since the upper limits of production are limited first, by the cow's inherited ability to produce, and later, by health, feeding and management, I consider breeding to be fundamental. I hope to make use of a program of breeding, based on the use of continuous testing in D. H. I. A.; good sires to transmit a high level of production; an analysis of the transmitting ability of my female lines; and the proving of sires to insure a high producing herd in the future. One of the newer developments in constructive breeding in which I am participating is the Pioneer Cooperative Dairy Cattle Breeding Association, Inc. This Association was recently formed in my locality for the artificial insemination of cows to good

sires. Membership in this gives us an opportunity to secure the service of sires usually beyond our reach, such as proven sires and young bulls selected for their outstanding indications of transmitting ability.

A Sick Herd Kills Profits

Herd health can also be a limiting factor in production. It is easy to see that the results of a good breeding program can be frustrated by a serious outbreak of disease, such as TB, Bang's Abortion or mastitis. Personally, I have a great deal of faith in a preventive program for herd health, making use of the blood test for Bang's Abortion, the TB test, and a carefully carried out system to guard against mastitis. Possibly the future may show some hopeful developments in calf-hood vaccination for abortion, as important research is under way.

Again, I ask you to pardon personal reference to my own herd. For several years it was maintained negative to the blood test. About a year ago blood tests revealed an infection which quickly spread to several cows. Frequent tests were made and the reactors removed under State indemnity, but not until a few of the cows aborted, again giving me a chance to see how ravaging the disease can be. Even though there was some loss in the disposal of these diseased cows, the fact remains that without prompt action the efficient production in my herd would have been ruined. The production of the healthy cows I salvaged from this outbreak more than makes up for this loss. For the past three months my Holstein herd has produced an average of 50.5 lbs. of butterfat per cow per month. I feel that a real disease control program is essential to go along with better breeding.

More Than One Source of Income

While the foregoing discussion seems a large order, it is by no means all there is to efficiency on the dairy farm. Size of business and good use of capital and labor are fundamental business principles that must not be forgotten. If the farm is not large enough or productive enough to carry enough good cows, or if a large farm is not stocked to somewhere near its capacity or, if it takes two men to do what one could do with a well-planned lay out, inefficiency is the result.

My own farm consists of one hundred and fifty acres on which there are normally eighteen Holstein cows of milking age and twelve or fifteen head of young stock coming on for

replacement or for sale. I aim for some diversity of income from the sale of surplus purebred cattle. Also a flock of eight hundred white leghorn hens brings in a substantial return on the investment. Some farmers could well raise a cash crop, or diversify with some other type of livestock. I feel that a definite trend to other types of livestock is under way and should be encouraged. However, as I like to keep hired help to a minimum, I chose the poultry and purebred stock. The work is evened up throughout the year, and "chicken chores" do not interfere with the regular cow barn chores. Rather, they chink in, and it seems as though there never is an end to chores at home.

Do Work the Easiest Way

With the use of electricity to the fullest extent and many small labor savers, I am able to care for the stock and poultry and raise my feed without hiring except day help during haying, harvesting and silo filling. I save some time each Spring by plowing much of my land in the fall. A day or two of custom tractor work helps get the seeding done on time. All trucking is hired in order that my own time may be free for productive work at home.

In conclusion, may I emphasize the importance of looking for efficiency all along the line in a farm business. A farmer must be a producer of high quality feed crops at low cost; he must be a breeder of good cows that not only produce but transmit that production to the future herd; he must guard their health and manage them well; he must make good use of capital and labor.

In short, let his slogan be "Efficiency all the Way."

ALFALFA in BAGS

By RAYMOND DUNN.

THE ALFALFA meal mill owned and operated by Bean Bros., of Hayts Corners, N. Y., a village twenty miles north of Ithaca, is, so far as I know, the only industrial establishment of its kind in New York state. Representing an investment of \$45,000, the mill was completed in 1938 and began its first full season of production in June of this year.

The mill does no custom grinding. Alfalfa is bought as it stands in the field, the average price paid the grower being \$6 per acre. The cutting is done by a machine called a "pick-up cutter." This cuts the alfalfa, chops it into pieces three-quarters of an inch or so in length, and by means of a fan and blower pipe shoots it into a truck which travels beside the machine as it moves over the field. The cutter is served by two dump trucks with especially designed box bodies, each of 4 to 5 tons capacity. One truck receives its load from the cutter while the other is on its way to the mill, thus permitting the machine to be operated as far as eight miles from the plant without loss of time. Pulled by a 12-20 tractor, the machine mows an average of six acres an hour. It has a seven-foot cutter bar.

At the mill, the trucks dump their load on a platform, from which steel conveyor belts carry the chopped alfalfa into the dryer. The latter consists of a furnace fired by jets of crude oil, to which is attached a huge revolving drum. Heat from the furnace is carried into the drum by a pipe passing along the axial line. Tossed about in the superheated air of the drum, the green alfalfa dries so rapidly that a ton of perfectly cured hay is produced every hour from four tons of green alfalfa. After being cured, the alfalfa is whirled out of the drum by air pressure and forced through pipes to the mill where it is processed into meal.

The mill itself differs but little from an ordinary grist mill except that it is a hammer mill instead of the usual burr mill. Hammers (triangular shaped pieces of steel, pivoted to swing freely) operate on a revolving drum against a screen, pulverizing the dried alfalfa as it passes under them. There are two grinding units, the coarse and the fine. The former reduces the alfalfa to a coarse meal like bran, after which it is sieved. The fine grinder receives the meal from the sieves and reduces it still further to a powdery green substance practically as fine as flour.

The mill produces three grades of meal varying widely in feed value—leaf meal, stem, and straight. Leaf meal, made entirely of the leaves, is a highly concentrated product containing not less than 20% crude protein nor more than 18% crude fibre. It is used chiefly in starting mashers for young chicks. Straight meal, a mixture of both leaves and stalks, contains at least 17% crude protein and is used in laying mashers. The cheapest grade, stem meal, contains no leaves, yet runs not less than 13% crude protein and is used both in laying mashers and as a dairy feed.

The mill has a capacity of one and one-half tons of finished meal per hour. A labor force of seven men is required to operate the plant in its entirety, three working in the field with the

cutter and trucks, and the others at the mill. No salesmen are employed; the output is disposed of by contracts made with hay and feed dealers throughout Central New York. Two Diesel engines generate the 300 horse power needed to run the mill.

The mill is owned and operated by three young men. Asked how they came to start such an enterprise, Walter, who operates the mill, replied: "We were trying to find a better market for our own alfalfa. We farm 350 acres, of which 200 are devoted to this crop." The mill not only solved their own marketing problem, but provided a profitable market for quite a number of farmers in the section in which it operates.

A general view of mill. The furnace and dryer are shown at the right and the engine room and grinding units are housed in the cement block structure at the left. Central structure is for storage purposes.

DOWN THE

By J. F. (DOC) ROBERTS

THE MORE I see of this Kentucky country, the more I appreciate our Northeast. Their land is either very fine, or very poor, which is probably the reason their livestock is exactly the same way. They haven't the great areas of good farm land which are entirely capable of taking care of livestock the year round that we have. They do have comparatively small areas of wonderful clover pastures and tobacco land, but as for good subsistent farming, we can far out-do them. This is also particularly noticeable with the people who seem to be either rich, well off, or really poor. So again, I am wondering if we of the Northeast appreciate how fortunate we are to have the neighbors, the home farms, and the livestock that we have.

It is interesting and instructive to note the change in pasture usage in just a few years. We now see cattle and sheep and, in a good many cases, sheep, cattle, and horses in the same pasture. The old idea that sheep were a bad pasture combination is very rapidly going out, and it should, for as these livestock men are finding out, sheep are particularly good for any pasture, and one of the best in combination with cattle. Right here I would like to call attention to the fact, that from now on this year no pasture will be as good as it has been, even though there is still plenty of feed. Therefore, all fat stock which you plan to market this fall should have some supplementary feed, as grain, soy beans, rape, clover or alfalfa meadows, etc., so that it will at least maintain its present flesh.

All grains are doing fine. I have never seen corn in New York State or across Ohio so far advanced this early in the season. Northeastern dairymen and livestock men will not have to worry about high-price feed this winter. This again brings about a situation that almost makes it imperative that the man with a barn full of feed, market it through livestock of some kind, for it will almost surely sell below cost of production on a cash basis.

The quality of hay this year is better than for a long, long time. I do not believe I am too far wrong when I say a great deal of it will have twice the feeding value of the bumper crop of a year ago.

The combination of cheap grain and high quality roughage makes almost an ideal set-up for lamb or cattle feeding this winter, and such an operation is almost sure to make money, particularly if stock is put in light and thin. It is also not a combination that makes for a large profit, because it brings about so much feeding that a shortage and high market cannot develop. Therefore, do not look for high livestock prices this fall, winter or spring.

Feed Horses More Salt in Summer

(Continued from Page 5)

sure to get enough salt. Unless the horse takes water his digestion will be poor and his appetite finicky.

An adequate amount of salt is necessary for men too, who work under great heat and where a great deal of perspiration is lost. By drinking an occasional glass of water to which a pinch of salt is added, the salt lost by perspiration is thus restored and the body functions normally again. Many large industrial establishments place

salt dispensers near the drinking water with the result that workers are relieved of any ill effects due to loss of salt through perspiration. A certain amount of salt is necessary in the body at all times to maintain metabolism or the smooth functioning of the glands. When one restores the salt lost through perspiration the body functions more efficiently and the chances of becoming fatigued are very much reduced.—John Spain.

HINTS for The FARM MECHANIC

By I. W. DICKERSON.

Shear Cut for Rivets

The best way for cutting off rivets is to shear them off with a square end chisel, rather than to cut them with a sharp edge. This is the method used by most wreckers in tearing up car frames.

Does Your Tractor Waste Fuel?

Tractors sometimes waste one-third to one-half the fuel because their owners do not know how properly to adjust the carburetors. To adjust, first run the tractor under load until the engine reaches the normal operating temperature. Then with it still under load, turn down the high speed adjusting screw until the engine starts to miss, when the screw should be slowly opened until the engine runs smoothly. Then the load should be removed and the engine allowed to idle, and the

idling screw adjusted until the engine idles smoothly and easily. If the engine misses under load while it is warming up, correct this by adjusting the choke slightly until the operating temperature is reached. Neither the idling or the high speed adjustments need frequent changing, but it is well to check the high speed one occasionally, as it may be affected by changes in fuel, operating load temperature, etc. Thus cultivating may need a trifle different setting than for heavy plowing.

Can't Rot Stumps in a Hurry

We get a good many inquiries about rotting stumps in a few months by boring holes in them and filling the holes with acid, but land clearing experts advise us that there is no practical way of doing this. Blasting with dynamite is the cheapest and most practical way to remove stumps.

Removing Rust

Many stoves and stove pipes will be found injured by rust when they are to be used again. Kerosene is one of the very best materials for loosening rust. A stove cleaned with ordinary stove blacking mixed to a paste with kerosene will look like new.

Don't Overlook Wood Fuel

A cord of hickory, hard maple, black locust, white or post oak, or ironwood will produce the same number of heat units as a ton of anthracite or good semi-bituminous coal, or about 1 1/4 tons of low grade bituminous coal. Other common woods have a lower heating value, about in proportion to their seasoned weight per cord.

Orange Co., N. Y., Onion Festival

(Continued from Page 6)

men and women and a group of school children will put on an ancient Polish harvest festival program. This is being directed by Stanislaw Polenski, director of the Cracow (Poland) Opera, a recognized authority in this field who is now in New York. He is lending his services to the Orange County farmers for his travelling expenses. There will be dances in costume, singing in both Polish and English, with music furnished by a band of fourteen Polish accordionists coming from New York City for the occasion.

After the distinguished guests have spoken, with their words broadcast to an expected crowd of 10,000, the climax of the program will be the crowning of the Harvest Queen. This lucky girl and her five attendant princesses must all be working girls who have known what it is for several seasons, at least, to have planted, weeded, harvested and sorted onions. They will be selected, not by popular vote or popularity contests of any sort, but by five prominent citizens of Orange County who will pass in judgment on

nominees selected by fraternal, religious and community organizations, schools, churches and granges in the area.

The Queen and her court were selected before July 25 and, preceding the Festival, will make a trip to the World's Fair in New York City, where they are to be greeted in Perylon Hall, feted in the Polish Pavilion and taken on a tour of the grounds. The Queen will also visit such nearby cities as Middletown, Poughkeepsie, Newburgh and Kingston to present symbolic bags of onions to their respective mayors and invite them to the Festival.

Because its primary purpose is to bring people to Florida on the day of the Festival and to let everybody in Orange and its surrounding counties know what a huge business onion raising is, there is to be no admission charged to the pageant, all committee chairmen and other workers are donating their time and many office-holders and other leading citizens of the area are helping out with contributions.

A special tabloid newspaper issue is to be printed by the Middletown Times Herald, principal news organ of the area, and whose Farm Editor, Mr. Pierson, was instrumental in organizing the Festival. This issue is to be 15,000 and will be distributed throughout the lower Hudson Valley.

Enthusiasm for the Festival is running high among the farmers and merchants of the muck-land area, aided no little by the prospects this year for a good crop, after the discouraging losses in 1938. It will be a colorful, jolly and unusual event, from the moment the motorcade starts until the last dancers in the streets depart for home late at night. All that is needed is for Nature to smile that day, with a sunny sky and no rain, to make it one of the high spots in Orange County's farming history.—Orrin Pierson.

"Looks like those fox hunters are going horse hunting again."

Sprains RELIEVED Quickly

Absorbine Sends Relief Direct To Muscles and Ligaments

Strained Muscles Eased While Horse Works

ASPRAIN doesn't have to lay your horse up. When you use Absorbine, he can do light work while he is being treated. Absorbine speeds relief direct to muscles, ligaments. It increases the flow of blood through them and the blood carries off the congestion. Will not blister. Many veterinarians have used it for over 40 years! At druggists. \$2.50 a bottle. W. F. Young, Inc., Springfield, Mass.

ABSORBINE

For relief of Your Own Strains, Muscular Aches and pains, use Absorbine Jr.

HOOF ROT-THRUSH

Dr. Naylor's Linite gives prompt relief. Easily applied, quick in action—just pour it on. A powerful, penetrating antiseptic and poultice compound for hoof rot (fouls) in cattle, thrush in horses. Keep a bottle on hand, use at first sign of lameness. At reliable dealers or by mail postpaid. Per bottle \$1.00. H W Naylor Co., Morris, N.Y.

NORTHEASTERN Slants

ON THE National NEWS

New Lend-Spend Plan Meets Obstacles

PRESIDENT ROOSEVELT'S \$3,860,000,000 lending program for "self-liquidating projects" (mainly highways, rural electrification, housing, railroad equipment and farm-tenant aid) has been working its way with difficulty through Senate Banking Committee. As we go to press it is about to face Senate test.

At hearings held by committee, both conservative Democrats and Republicans spoke against it, charging that it was just another pump-priming scheme under a different name. Opposition resulted in committee's making large-scale cuts in President's total figure, bringing it down to approximately 2½ billion dollars. Although bill is expected to meet further stiff opposition in Congress, it is predicted that it will pass in modified form.

Ninety-two per cent of nation's press has attacked this latest spending plan. "To the extent that Government spending succeeds at all," says the New York Times, "it succeeds merely in producing a series of minor speculative booms that tend to obscure the necessity of changes in governmental policy."

SLANT: One thing that this country certainly does not need is another spending program which gets nowhere except to raise the national debt. What we do need is a government policy which will restore public confidence by cooperating with business, by cutting down on wild government spending, and by at least trying to balance Federal budget.

Farmers Testify At Labor Hearing

AFTER a series of delays, farmers were finally given on July 25th a chance to testify before Senate committee which has been investigating administration of Wagner Act by National Labor Relations Board. Following is first-hand account of the hearing, telephoned to us from Washington just as we go to press:

"The Committee was very definitely pro-labor, with only two Senators on it sympathetic to agriculture—Taft and Donahey. It is a very poor committee for farmers to have to appeal to for a definition of agricultural labor. Labor Board was strongly attacked in much of testimony given at hearing, and Committee showed tendency to be on defensive in regard to the Board.

"Agricultural witnesses centered their testimony on three points: 1. What is agricultural labor?; 2. Why it should be exempted; 3. Effect of labor organizations and strikes on agriculture.

"Testimony was given by farmers from all parts of the country. It ranged from testimony on strikes of field workers, pickers and packers in California, where there is a real revolution, with farmers assaulted, workers beaten up, and crops badly damaged, to that given by New York State farmers who acted promptly to forestall the development of a real labor movement by rallying around at the first attack by labor at Batavia, N. Y. All testimony by agriculture showed in general that where the Labor Board has been called in to settle disputes, the Board has either favored the workers in its de-

cision, or made no decision whatever, leaving the case hanging in the air and refusing to define the term 'agricultural worker.'

"Senators on the committee listened very sympathetically to what farmers had to say but in their discussion they tried to lead witnesses into the field of world and national economics. They left one feeling that the whole problem is one of adjusting the economic conditions of all workers, and that farmers must expect to suffer some loss while the problem is being worked out.

"T. A. Buhl and Warren Hawley, New York State farmers who testified regarding Labor Board's handling of case against G.L.F. Produce, Inc., at Batavia, N. Y., last summer, were agriculture's best witnesses. They put plenty of personality into their testimony and really impressed the Senators on the committee with the trouble that agriculture is experiencing."

SLANT: It is generally agreed that chances for amending Wagner Act at this session of Congress are next to nothing, as Congressmen are in a hurry to go home and Administration's policy apparently has been to drag out these hearings until too late to do anything about it. Fortunately, a new and more vigorous inquiry into Labor Board's administration of Wagner Act has just been ordered by House of Representatives. It is to be hoped that this will result in much needed legislation to make Wagner Act fairer to all parties. Farmers have a big stake in this matter, for unless intent of Congress to exempt agriculture from provisions of both Wagner Act and Wage-Hour law is upheld, farmers face discouraging prospect.

Ban on Politics

IF PRESIDENT ROOSEVELT signs a bill that is now on his desk—the Hatch bill—Federal officeholders will be prohibited by law from meddling in political campaigns. Also, huge relief machinery will be taken out of politics, as bill penalizes political coercion of relief workers.

Bill was sponsored by Senator Hatch (Democrat) of New Mexico and grew out of last year's charges that WPA was up to its neck in politics. Here is exactly what it does:

1. Makes it a crime for any person to "intimidate, threaten or coerce" so as to interfere with the right of any other person to vote as he pleases.
2. Makes it a crime for any governmental administrative official to "use his official authority for the purpose of interfering with or affecting" the election of any candidate for Federal office.
3. Makes it a crime for any person "directly or indirectly, to promise any employment, position, work, or other benefit" made possible by any act of Congress as a reward for any kind of "political activity."
4. Makes it a crime for any person to "deprive, attempt to deprive, or threaten to deprive, by any means" any person of "any employment, position, work, compensation or other benefit provided for or made possible by any act of Congress appropriating funds for work relief or relief purposes, on account of race, creed, color, or any political activity."
5. Makes it unlawful to solicit or assess from relief workers contributions to be used for political activity.

Violation of these rules would be considered a felony subject to a year's

imprisonment or a \$1,000 fine, or both; and offender would lose his job. Only government officeholders exempted by bill are President, Vice-President, and certain officials connected with executive branch of Federal government. President Roosevelt is expected to sign the measure, though he is said to be against it.

SLANT: If this bill becomes a law, it should put an end to use of relief organization as a vote-getting machine by any political party. A mixture of politics and relief is something that most citizens can't stomach.

Chicago Milk Indictments Dismissed

JUDGE CHARLES WOODWARD, Federal Court in Chicago, has dismissed indictments against 43 individuals and 14 corporations in Chicago milk industry. Indictments, voted last November 15, charged conspiracy to violate Sherman anti-trust laws.

Among defendants were Leland Spencer, New York State College of

Better Times This Fall?

IN NEW YORK CITY a week ago, an economist close to what is going on in the business world told me that during the next six months business conditions will be much better. Since then I have confirmed this in several places with men who ought to know, and they all agree that for a while at least we are going to have better times. The chief reason for this is the fact that business men have had so little confidence in the future during the past year that they have done little buying and there is little if any stock on the shelves to sell. If they are to continue in business they must buy, and buy soon.

As soon as the buying begins, that starts the wheels of commerce going, and times improve. The stock market also, which is always a barometer, is showing recent signs of revival.

If these prophecies are right, farmers will have better markets for milk, poultry and the cash crops to be harvested this fall. Here's hoping!—E. R. E.

Agriculture, and W. A. Wentworth of the Borden Company, who acted as mediators between producers and dealers.

Judge stated that Secretary Wallace, under the Agricultural Marketing Agreement Act, is given power to regulate agricultural commodities, and therefore Sherman Act does not apply to milk industry. Department of Justice representatives have indicated that the case will be appealed to Supreme Court.

AAA Farm Program For 1940

AGRICULTURAL Adjustment Administration has announced its farm program for 1940. Changes from 1939 are minor, centering on increased emphasis on soil conservation, bigger opportunities for participation by small farmers, and greater responsibility by committees of farmers.

Payments include a minimum payment of not less than \$20 to be earned by soil building practices on small farms. Growing farm gardens is en-

couraged by providing a \$2 allowance for family gardens, and a deduction of \$2 where no garden is raised.

Britain Gives in To Japan

SINCE June 14, Britain and Japan have been "talking" to each other. Britain has been demanding that Japanese army stop its blockade of British and French areas in Tientsin, China, which grew out of refusal of English to turn over to Japanese four alleged Chinese terrorists. Japan has been saying, "We won't stop it until you recognize our new conquests in China and quit acting hostile to Japan." Last week, British Prime Minister Chamberlain announced result of talks: A preliminary agreement has been reached under which British government gives in to Japanese demands and promises not to permit actions in British sphere in China that might endanger or obstruct Japanese Army.

Although Chamberlain declared that Britain's policy in Far East has not changed, Japan is hailing agreement as a "sweeping diplomatic victory," granting her a free hand in China. General comment on Britain's action is that she has too many troubles at home to permit her to take on the Japanese at this time.

As we go to press United States has just ended our commercial treaty of 1911 with Japan. By this strong action, United States serves notice on Japan that this country will insist on its rights in Far East. Though action cannot take effect for six months it paves way for Congressional action on pending resolution for an arms embargo against Japan.

Equal Regulation for Transportation

UP FOR consideration of Congress is Bill Number S-2009, commonly referred to as Transportation Act of 1939.

Already passed by Senate vote of 70 to 6, bill would amend Interstate Commerce Act and put regulation of all competitive forms of transportation (trucks, waterways and railroads) on equal basis.

Through President E. A. O'Neal, executive committee of AFBF, has gone on record as favoring act, but says:

"In the event of the passage of act substantially in its present form, it should specifically direct the Board of Research and Investigation, provided for in the act, to give immediate attention to the possibility of giving greater freedom of action to railroads in solving their competitive problems."

Good Advice to Dairymen

DAIRYMEN gathered at Livonia, N. Y., on July 16, for their annual outing, were urged by Erskine M. Harmon, Federal Administrator for metropolitan milk market, to strengthen their cooperative organizations in the milk marketing field. Praising New York State marketing plan, Mr. Harmon said: "It is important that co-operatives should use this opportunity to strengthen their organizations. Even though the constitutionality of this order has been upheld, no one can provide you with a certainty that it will remain in effect always."

SLANT: Administrator Harmon is right. Dairymen and their cooperative organizations must get together and stick together if there is ever to be any permanent solution of milk marketing problems.

STEEL SHEETS MAKE ECONOMICAL FARM BUILDINGS

Poultry House—H. H. Marlette of Mt. Vision, New York built this steel laying house for less than it would have cost to use wood. It is rat-proof and fire-proof; warm in winter and cool in summer. Marlette lined the house with insulating board. An even better method is to use steel inside and out as shown below. * Chickens won't peck at it and it is easy to clean. This type of construction is also well suited to granaries.

BECAUSE buildings roofed and sided with steel take less hired labor and are cheaper to put up than any other type of farm construction, G.L.F. started two years ago to handle galvanized steel sheets for its patrons. The corrugated sheets then being offered to farmers were generally unsightly in appearance, sometimes leaked at the seams,

and often rusted out quickly because the zinc coating was too thin.

Through United Cooperatives, G.L.F. undertook to overcome these flaws.

The result is the ridge-type sheet shown on these pages. It is neat in appearance. The ridge construction gives excellent drainage at the joints. Most important, it is coated with two full ounces of

zinc per square foot—nearly double the old standard.

Farmers now have at their command a building material that is rat-proof, fire-proof, and lightning-proof; low in first cost, easy to erect, and needs no maintenance except a coat of zinc metal paint every few years. How they are using this material is shown in the four illustrations on this page.

Barn—Fire and lightning hazards on Peck Brothers' new barn at Stamford are greatly reduced by roofing it with steel. For barns and all other permanent farm buildings, steel roofs are most economical per year of service provided they carry at least a two-ounce zinc coating.

Farm Home—W. D. Stoughton of Snyder Hill, New York protects his home against lightning with a properly grounded steel roof. Because it is fire-proof, insurance rates are considerably lower.

*STEEL CONSTRUCTION THROUGHOUT

Tool Shed—For \$39 Will Miller of Danby transformed a rickety old building into a good solid fire-proof tool shed and farm shop with Unico steel sheets.

HOW YOUR ENGINE USES OIL

All engines use some oil. It is perfectly normal to have to add a quart occasionally between fillings. When an engine uses *too much* oil it is usually for one of these reasons:

1. External Oil Leaks

Oil lines, gaskets, and bearings sometimes develop leaks. Your garageman can check this and correct it by replacing the defective part.

2. Worn Valve Guides

The stroke of the piston sucks extra oil past worn valve stems or valve guides and into the combustion chamber. New valve packing or new valve guides will usually correct it, but sometimes the valves themselves need to be replaced.

3. Oil Passing Piston Rings

Tapered or out-of-round cylinders or collapsed pistons cause excessive wear on the rings. These conditions, if not too severe, can be corrected by installing new rings of the type made especially to fit the situation.

More often, however, excessive oil consumption is caused by—

4. Excessive Bearing Clearances

Bearing clearances increase with wear. When clearances are doubled, five times the normal amount of oil is thrown on to cylinder walls. The piston rings can't scrape away so much oil; part of it slips by into the combustion chamber. In this case a ring job won't do any good—it is necessary to adjust or replace the defective bearings.

* * * *

All these causes trace back to *wear*. Oil cannot correct wear, but a lot of wear can be prevented if the right oil is used from the start. Not even an oil man can tell by the looks or feel of oil whether it has the toughness to stand up in the engine. The only way to be sure of your oil is to make it according to exact specifications and to check it in the laboratory.

It is this service that G.L.F. performs for patrons in supplying them with Bureau-Penn oil through United Cooperatives.

POTATOES NEED DUSTING

More than 60% of all G.L.F. patrons raise some potatoes, mostly in small plots of less than four acres. These potatoes usually do not keep as well in storage as the potatoes raised by large growers. The reason is blight.

Large growers control blight by dusting with copper fungicide through the growing season right up to the time the potatoes "go down." This improves not only keeping

quality but cooking quality, and sometimes increases yields up to 50%.

Commercial growers have elaborate machinery to do this job, but the average farmer does not need any expensive equipment. All he needs is a small hand duster with a quart container and a plunger operated like a spray gun. The nozzle should be bent so it will dust both under and over the leaves.

Such a duster may be obtained through G.L.F. Service Agencies for around a dollar.

For bugs and blight, use 60-20-20 Lime-Copper-Calcium Arsenate dust. It can be purchased in 5-pound bags or 50-pound bags. If you have licked the bugs use 80-20 Lime-Copper dust for the rest of the season, at weekly intervals if it is rainy or less often if the season is dry.

Some Questions on Production Control

By LELAND SPENCER.

"BRIEFLY, dairymen are faced with this situation: If they receive a low price for milk, many of them face bankruptcy. If they receive a favorable price, they will increase production and the industry will be faced with a burdensome surplus that would be difficult to control under any kind of a marketing system.

Leland Spencer

"To meet this situation we believe that some form of production control should be considered, whereby dairymen would receive a reasonable price for that portion of the milk which is used to meet the requirements of the New York Metropolitan Market. Production in excess of this amount would be kept on the farm or manufactured at the discretion of the dairymen. Such a plan would probably mean the establishment of quotas for each dairy farm in the New York Milk Shed. It undoubtedly has many disadvantages. However, we feel it is worthy of study by milk marketing experts . . ."

The above statement is quoted from a resolution adopted by the executive committee of one of the county farm bureaus of New York State early in April of this year. It shows that the dairy farmers of the New York milk shed are giving serious thought to the possibilities of production control as a means of raising or stabilizing the price of milk. They want to know whether some price plan can be put into operation that will give an inducement for adjusting or holding down deliveries of milk without causing hardship, confusion, or expense out of proportion to its value.

Thus far no definite plan of production control has been promoted for this milk shed. This, I think, is fortunate. We could easily become so wrought up and confused over the details of a particular plan as to become incapable of studying the problem with open minds. Several important questions should be answered before we get involved in any public discussion or controversy about specific proposals. Some of these questions are:

1. What types of plans for production control of milk have already been tried out, and what others have been suggested?
2. What have been the results of experiments with different plans for production control of milk?
3. What are the special conditions of milk production and market demand in the New York milk shed that any such plan would have to fit into?
4. How would the application of such typical price plans affect the prices received by different groups of producers?
5. What legal and administrative problems are involved?

The Department of Agricultural Economics and Farm Management, in the New York State College of Agriculture, has begun a study that will help to answer these questions. The Research and Service Division of the Farm Credit Administration is cooperating in this work, because similar questions are being raised in other milk sheds where the F.C.A. is depended upon for advice in such matters.

Our position at the outset of this study is that we are neither for nor

against production control. We are not sure whether any acceptable and workable plan of production control can be devised for the New York milk shed. We have no specific plan to propose. Our purpose is to set up as good answers as we can to the questions that are stated earlier in this article. Several months' work will be required to do this because we intend to make a careful analysis of deliveries by more than 2,000 producers in all parts of the milk shed. If the weather man continues to control production as effectively as he is now doing, our results will be available in ample time for consideration when public discussion of production control develops to a critical stage.

In an early issue, we plan to outline different plans of milk production control that have been used in various markets, also some plans that have been suggested but not yet put into operation.

Class I Milk Price Up for August

Administrator E. M. Harmon has announced an increase in the prices of Class 1 and Class 2-A milk for the month of August. Class 1 price is increased from \$2.00 to \$2.25 and Class 2-A price from \$1.50 to \$1.55. These increases are provided for in the order and are based on the wholesale price of 92-score butter in New York City.

It has been estimated that the base price to producers for the month of

New York Milk Prices With Comparisons

	June 1939	June 1938	June 1910-14	May 1939
Milk, Grade B, 3.7%, 201-210 mile zone:				
Dairymen's League, per cwt.*	\$1.09	\$1.21	\$1.05	\$1.00

Pounds feed equal in price to 100 lbs. milk	86	99	74	77

*Net pool return without special location or upstate city differentials.

†Adjusted for change in seasonal variation of price.

July will be approximately \$1.50. The increase in the prices of Class 1 and Class 2-A for August will result in a further increase for that month, also it is expected that dry weather which has cut production of milk will result in a larger percentage of the total production going into the higher classifications.

On July 15, cold storage holdings of butter were estimated at 148,870 pounds. Last year, 146,400,000. Of this year's holdings, about 113,616,000 pounds are owned by private trade, the balance by the Government. Government holdings have been moving in to relief channels rapidly. Money has been appropriated for further surplus buying but plans for this buying have not been announced.

Potatoes

Potatoes have been selling better in New York City. Receipts from New Jersey and the Eastern Shore have been light while shipments from Long Island have been increasing.

The U. S. Department of Agriculture reports that potato production in the

intermediate states is likely to be about 3.5 million bushels less than a year ago when production was 21.7 million bushels. Business conditions are expected to improve which will result in a better consumer demand. Many potatoes are of poor quality and are meeting with slow demand. Anything that producers can do to maintain quality will result in better returns.

Production in late northern states according to indications on July 1st were 291,000,000 bushels which is about four million more than last year but about nine million below the ten year average. Since that date, dry weather has hurt the crop in the Northeast and doubtless the August 1st report will show a reduction in probable yield in this area. July 1st report indicated that the New York crop would be 25,080,000 bushels compared to last year's crop of 26,840,000.

Poultry and Eggs

Available records indicate that 22% more chicks were hatched the first six months of this year than were hatched last year. That figure alone may cause poultrymen to reach the wrong conclusion. On June 1st it was estimated that there were 3% more young chicks in flocks than a year ago. It is estimated therefore, that on next January 1st, there will be 2 or 3% more hens in farm flocks than on Jan. 1, 1939.

The chief factor in holding down numbers of hens will be the egg-feed ratio, which is less favorable to poultrymen than it was a year ago. In New York State for the week ending July 21, it took 7.5 dozen eggs to buy 100 pounds of feed. A year ago it took 6.1 dozens.

Government figures show an increase in the demand for sexed chicks. Fifty-two hatcheries reported 728,000 chicks sexed in June as compared with 441,000 a year ago.

This year's turkey population is bigger than last year's. For the month of June, 48% more salable turkey poults were hatched by commercial hatcheries than a year ago. The same hatcheries reported a big increase in orders for deliveries after July 1st.

On July 15 it was estimated that storage holdings of eggs were 7,048,000 cases which was 689,000 more than last year. Estimates of frozen eggs on the same date were 144,139,000 pounds. Last year, 140,210,000.

Forestry Field Day

August 15 is the date of the Central New York Forest Field Day at Arnot Forest, Schuyler County, New York.

There will be a tour of the area in the morning with talks by Professor J. A. Cope and Prof. J. D. Pond.

Those who plan to attend should bring their own basket lunch. In the afternoon, beginning at one o'clock, there will be contests in tree identification, sawing and log scaling, followed by a trip to the Cotton-Hanlon Lumber Mill at Cayuta.

Beginning January 1, 1940, sportsmen may buy separate hunting, fishing and trapping licenses. The combined hunting and fishing license now costs \$2.25, while under the new arrangement hunting licenses will cost \$1.65, fishing licenses \$1.65, and trapping licenses \$4.25.

Milk Marketing News

Buffalo Order May be Amended

July 31 was date of hearing on changes in Buffalo milk marketing order. On that date presses started to print this issue of *American Agriculturist*, so we are unable to give you the result of the hearing.

The Niagara Frontier Cooperative Milk Producers Bargaining Agency asked for the hearing, recommending a year-round price of \$2.65 a hundred pounds for Class I milk sent directly from farms to plants within the marketing area. Present order provides for a price of \$2.45 from April to July inclusive, and \$2.85 August through March.

Also recommended is a year-round price of \$2.55 for Class I milk delivered to other plants serving the Buffalo area. The order now provides \$2.35 from April to July inclusive, \$2.75 from August to March.

Propose Changes in New York Order

Sheffield Producers Cooperative Association proposes amendments to the Federal-State order for New York City. An editorial in the "Sheffield Producer" approves the principle of diversion payments made to dealers to divert fluid milk to manufacturing plants, but recommends a reduction in amount, which under order is 23 cents a hundred.

Also endorsed are payments to cooperatives for services rendered to members but a review of the amounts is asked. Present order calls for 1 cent a hundred to bargaining cooperatives, 2½ cents to cooperatives who sell members milk and also handle payments, and 5 cents a hundred to cooperatives who also own plants for manufacturing surplus.

Proposed amendments are to be studied by Metropolitan Producers

Bargaining Agency, and if adopted will be subject to hearings throughout the milk shed, after which they will be voted on by dairymen.

Producers Can Do Own Organizing

Federal Trade Commission, on July 23, ordered Gold Medal Farms, a New York milk distributor, and two of its officials to discontinue "deceiving, forcing or intimidating" New York or Vermont milk producers in their efforts to organize producer-controlled cooperatives. The men named were Joseph Fromm, general manager, and Paul Steffin, superintendent of the Buskirk plant of Gold Medal Farms. The firm was ordered to cease "threatening reprisals or interfering in any way" with the organization of cooperative associations of milk producers. Also that it cease control or dominating the Washington and Rensselaer Counties Producers Cooperative Association or any other producers cooperative association.

Government Seeks Injunction Against Milk Dealer

On August 9, Federal officials will seek an injunction in Federal court at Malone to restrain Adler's Creamery, with plants at Herkimer and Fort Plain, from violating provisions of the Federal-State marketing order for New York City. It is charged that Adler's Dairy owes \$46,618.67 to the market administrator for payments covering the period from September, 1938, through January, 1939.

Complaint points out that defendant competes with other dealers and unless company is restrained from continuing to violate the order and compelled to comply with its provisions, other handlers will be encouraged or compelled by economic necessity to refuse to comply with the provisions of the order.

The FARM NEWS

League Urges Milk Price Increase

FOLLOWING is a telegram sent by Fred Sexauer, President of the Dairymen's League, to the Metropolitan Milk Producers Bargaining Agency. Mr. Sexauer points out that dry weather has increased the production cost of milk and suggests a hearing to discuss an amendment to the milk order increasing the price schedule.

Here is the telegram:

July 26, 1939.

Metropolitan Cooperative Milk Producers' Bargaining Agency,
Hotel Onondaga,
Syracuse, N. Y.

The United States Department of Agriculture reports that New York State has been hardest hit of any State by the current drought. It is common knowledge that there is practically no pasturage for milch cows in the New York milk shed. Drought caused a short hay crop. Grain yield is subnormal. The corn crop is likely to be extremely small. In many sections dairy farmers are put to extra expense to haul water for cattle and also have to use purchased feed. These conditions all increase the cost of produc-

ing milk. It is imperative that immediate action be taken to obtain higher prices for farmers. Therefore we urge you to petition the United States Secretary of Agriculture and the New York State Commissioner of Agriculture and Markets for an immediate hearing to amend the Federal and State marketing orders so that the price paid to farmers for milk shall be increased during the emergency period. Hearing on such amendment should be held at the earliest possible moment. The hearing should be restricted to consideration of this one amendment because of the necessity for quick action to raise farmers prices to prevent a decline in milk production that might endanger the supply.

—FRED H. SEXAUER, President,
Dairymen's League Co-operative Assn.

Summer Fruit Meeting August 18

For a number of years, the New York State Horticultural Society has held a summer meeting and tour. This year the society members will visit the College of Agriculture at Ithaca, Thursday, August 18th. All fruit growers whether or not they are members of the Society are invited to attend.

The chief point of interest will be the university orchard, and plans have been made by Dr. Heinicke, head of the Pomology Department to divide the guests into small groups. This will give everyone an opportunity to see the exhibits better and to ask the guides questions about them. There will be a number of exhibits and demonstrations. J. Roe Stevenson of Cayuga, New York, President of the Society will present a brief indoor program and Dean Ladd will give a short address of welcome.

Eastern Fruitmen to Go to Amherst

Fruitmen of the eastern part of New York state, members of the New York State Horticultural Society, announce their annual summer meeting for Friday, August 11, on the grounds of the Massachusetts state college and experiment station at Amherst, Massachusetts. The program starts promptly at 10 o'clock in the morning, and all growers are invited.

Jefferson County Dairy Queen

Watertown has been having an International Home Week celebration. One event was a milking contest with cash prizes to the winners and the title of "Dairy Queen" accompanying first place. The winner and Dairy Queen was 20-year old Marion Nichols, daughter of D. W. Nichols, well known Jefferson county dairyman. Second place went to 14-year old Thelma Hamilton of Adams, and third place to Mrs. Merrill Petzoldt of Beaver Falls.

Potato Field Day

Just about time this issue of *American Agriculturist* arrives, potato growers will be heading for the farm of Gardner Brothers at Tully, New York for the tenth annual meeting of the Empire State Potato Club on Aug. 3. Last year attendance was estimated at 12,000.

Gardner Brothers are among the oldest and largest growers of seed potatoes in New York and their farm is ideally located for them to act as host for the Field Day.

There will be a large exhibit of potato growing machinery and much of it will be seen in actual use. Future Farmers and 4-H members will take part in several contests and demonstrations.

The chief speaker of the afternoon program will be Congressman Ralph O. Brewster of Maine. At present he is a member of the House Committee of Agriculture and for many years has been interested in farm legislation. He is former governor of the state of Maine.

The program for Field Day starts promptly at 8:30 A. M. eastern stand-

ard time and is being broadcast by electric amplifiers to give everyone an opportunity to know what is going on.

Grange Singing Contest

A sectional Grange singing contest to determine winners to go to the State Fair was recently held in Ithaca. Winners were as follows:

Duets: First, Mrs. Madge Hawks, Mrs. Bessie Gurney of Castle Creek, Broome County. Second, Clifton and

Phyllis Richards of Candor Grange.

Women's Solos: First, Mrs. Arthur Barnum of Burdette Grange, Schuyler County; Second, Miss Cornelia Munson, East Lansing Grange, Tompkins County.

Men's Solos: First, Milton Adams, Hornby Grange, Steuben County. Second, Jasper Munson, East Lansing Grange, Tompkins County.

Quartette: First, Mrs. Madge Hawks, Bessie Gurney, Miss Thelma Knapp and Miss Patricia Ralston of Broome County.

Grange Bread Baking Contest News

ANOTHER Grange brother has won laurels in a Subordinate Grange bread baking contest. First prize in contest held by Mellenville Grange, Columbia county, was carried off by Alfred Walsh of Mellenville, N. Y.

In spite of the hot weather, reports of interesting and well attended contests continue to pour in from Grange

summer. Since her grandmother's death two years ago, Irene has carried on the many duties of the home, keeping house for her father and five brothers, in addition to responding to the demands of the church and the neighborhood. She is a great worker in "The little Brown Church" and leader of our local "Home Making Club."

Following is a complete list of Subordinate Grange winners reported since our last issue:

Subordinate Grange Winners

COUNTY	GRANGE	WINNER
Albany	Bethlehem	Mrs. E. E. Blankenhorn
Allegany	Caneadea	Mrs. Corinne Nicholson
	Rushford	Mrs. Daniel H. Williams
Cattaraugus	Emerald	Lovena Sheffield
	Farmersville	Mrs. Gladys Charles
Cayuga	Sennett	Mrs. Roy Gardiner
Chautauque	Cassadaga	Mrs. Mary A. House
	Sherman	Mrs. E. R. Swezey
	Ross	Mrs. Daisy Lopez
Columbia	Johnstown	Mrs. Leon. J. Sherwood
	Mellenville	Alfred M. Walsh
Cortland	Cuyler	Roxie S. Hathaway
	Homer	Mrs. F. E. Beek
	South Cortland	Mrs. Gertrude Fuller
Delaware	South Kortright	Mrs. Frank Wilson
Dutchess	Oak Grove	Mrs. Claude O. Jaycox
Erie	Wyandale	Mrs. Florence Townsend
Essex	Ausable Valley	Miss Ruth Hoag
Franklin	Chateaugay	Mrs. Elizabeth Sweet
Genesee	Bethany	Mrs. Harry Hartwig
	N. Alexander	Mrs. Raymond Strong
Herkimer	Little Falls	Miss Bessie P. Wright
	Norway	Mrs. Casper Kemler
Jefferson	Champion	Mrs. George Fleming
	Pamelia	Mrs. Ethel Dewey
	South Rutland	
	Valley	Mrs. Mabel Trembley
Lewis	Barnes Corners	Mrs. Florence T. Maher
Monroe	Pittsford	Miss Phoebe Smith
Onondaga	So. Onondaga	Mrs. Homer Givitt
Oneida	Boonville	Mrs. Laurene Ernst
	Steuben	Mrs. George Bowen
	So. Trenton	Mrs. Floy M. Davis
Ontario	Enterprise	Mrs. William Gainey
	Reed Corners	Mrs. George Dewey
Orange	Mountainville	Mrs. Alma Peterson
Orleans	Barre Center	Mrs. Bryan Snyder
Oswego	Palermo	Mrs. Herman Hollenbeck
		Mrs. Christine Raymond
Schenectady	Scotia	Mrs. Mildred Hartman
Schoharie	Summit	Mrs. Milo Karker
Schuyler	Reading	Mrs. Georgia Chadwick
Seneca	Rose Hill	Rachel Lautenslager
Steuben	Hartsville	Mrs. Clarence Travis
	Oak Hill	Mrs. Harry Sutfin
	Prattsburg	Mrs. Lou Rolosen
	Stephen's Mills	Mrs. Sprague Pierce
St. Lawrence	De Peyster	Mrs. Ralph Fishbeck
	Edwards	Mrs. Evelyn Watson
	Heuvelton	Mrs. Corine Kelly
	Lisbon	Miss Irene Binion
	Massena	Bessie M. Southworth
	Pitcairn	Mrs. Mona L. Tiffany
Tioga	Tioga	Mrs. Myra Duff
Ulster	Highland	Mrs. Lucy Craig
	Huguenot	Mrs. Fred Drossel
Washington	Bottskill	Mrs. Ashton Woodward
Yates	Crystal Valley	Mrs. M. Dencenburg
	Middlesex	Mrs. Martin M. Mead

Another prize winning loaf of bread and its maker, Mrs. Earl Lafler, of Canandaigua, N. Y. Mrs. Lafler came out first in contest held by Rushville Grange, Yates County.

chairmen. Mrs. Wilbur Forbes, chairman for Homer Grange, Cortland county, writes:

"The bread baking contest stirred up the greatest interest of any of the baking contests sponsored by the Grange and *American Agriculturist*. Our committee got a big surprise when so many loaves of bread came in, and such beautiful loaves they were! Twelve contestants took part, and our judges said it was a real job to make decisions as to scores. The entire Grange, both Subordinate and Juvenile, enjoyed looking over the display, and then we served for refreshments the bread with cold milk, real homemade butter and strawberry jam. We were overwhelmed with the enthusiasm of our members."

Chairman Ruby M. Smithers, of Lisbon Grange, St. Lawrence county, writes:

"Our bread baking contest was a great success, with 7 fine loaves entered. After the judging we sliced and buttered the homemade bread, which we served with coffee, 15 quarts of strawberries and cream and sugar. First prize went to the youngest contestant, Miss Irene Binion, who is also our Grange secretary. She is 21 years old and has added bread baking to her many duties only this

The New Farmall-A

THE INTERNATIONAL HARVESTER CO. recently announced a new low-priced small Farmall, which they designated as "Farmall A." Power is provided by a four-cylinder valve-in-head engine, with a rated drawing power of 9 horsepower and a rated belt horsepower of 11.66. The tractor is equipped with a four-speed transmission, giving forward speeds of $2\frac{1}{4}$, $3\frac{5}{8}$, $4\frac{3}{4}$ and 10 miles per hour, with a reverse speed of $2\frac{7}{8}$ miles per hour. In low gear it can be governed down to $1\frac{1}{2}$ miles per hour without loss of pulling power.

The rear wheels are adjustable by 2" intervals from 40" to 68" wide.

A new feature is placing of the engine somewhat to the left of the driver. The operator sits directly over the row when he is cultivating just as he does on the horse-drawn cultivator, which gives him clear vision to see what is going on.

Fuel tests have shown that the Farmall A will plow up to an acre on a gallon of fuel, disc $2\frac{1}{2}$ to 3 acres, cultivate 2 or more acres of corn, or cut $2\frac{1}{2}$ to 3 acres of hay. In an average field the tractor will pull a 16" bottom on a plow at a speed of $4\frac{3}{4}$ miles per hour.

The first Farmall tractor was built 17 years ago. Since that time nearly a half million have been sold.

THE VALVOLINE OIL COMPANY of Cincinnati, Ohio, has announced a new product "Valvoline X-18," an all-season, all-purpose gear lubricant. This product has been tested for three years, and it is designed to replace 18 summer and winter lubricants. There are, of course, several advantages. Dealers will be able to stock a fewer number of lubricants, motorists will find it unnecessary to change for winter and summer and naturally, there is less danger of errors in lubrication. "Valvoline X-18" is the only lubricant needed every day in the year for overdrives, transmissions and differentials.

Some time ago we announced the GOODYEAR TIRE & RUBBER COMPANY'S Essay Contest on the subject "Farming of Tomorrow on Rubber." The grand prize for ten winners will be a trip to Akron, Cleveland, Detroit and Timagami, Ontario, as the guests of P.

W. Litchfield, President of Goodyear. On the way back they will visit the Dionne Quintuplets, Toronto and Niagara Falls.

Among the ten winners was Robert Ector of Wilmington, Delaware. North-eastern boys who won \$25 in cash were Earl Langley, Mars Hills, Maine; and Oliver Hilton of Woodbine, Maryland.

* * *

Much publicity has been given the school girl who wrote the GENERAL ELECTRIC CO. asking for a small sample of electricity. That is a hard

order to fill, and for that matter, it is not easy to explain a kilowatt in understandable terms. The General Electric Co. has attempted to visualize the facts. They figure that a man pumping water steadily for ten hours could raise 14,000 gallons of water 10 feet, and would thereby do work equalling $\frac{1}{2}$ a kilowatt-hour—an amount of electrical energy which would cost perhaps 5c or less and about enough "juice" to run a large household fan to keep him cool while he was working. In six hours a man lifting packages from the floor to a table might raise 65 tons 4 feet and use energy equal to $1\frac{1}{5}$ a kilowatt-hour, about enough electricity to run an electric curling iron.

In addition to the trip, the essay of Harold Smith of Halfway, Oregon, on the subject of "Farming of Tomorrow on Rubber" won him \$100 in cash.

NEARBY MARKETS for NEARBY POULTRYMEN

The chick battery at Willow Brook Farm.

"Never Set Foot to Ground"

By H. L. COSLINE.

ON WILLOW BROOK POULTRY FARM, owned by Allen Bulkley, Odessa, New York, I recently saw, in a laying house, hens that had never set foot on the ground. What perhaps is more remarkable is the fact that these hens are the tenth generation of birds reared entirely in confinement.

"They have never had any medicine," said Mr. Bulkley, and if looks are any basis for judgment, they do not need any. They are healthy, vigorous and able to produce heavily.

Mr. Bulkley started in the chicken business in 1915. Said he: "When I think how many things there are that I have yet to learn about the chicken business, I realize that I knew practically nothing when I started in."

In 1928 Mr. Bulkley started raising chickens on wire floors. He started out with $\frac{1}{2}$ " mesh wire, but now finds that $\frac{3}{4}$ " 16-gauge wire is more satisfactory. The idea was no mere whim, but was done in an attempt to get away from serious disease problems and heavy mortality that threatened to wreck the business. At first the chicks were allowed outside only on wire-floored porches, and this worked so well that wire was also used to cover the brooder house floors.

A breeding program has been followed carefully in order to increase production and vigor. The chicks are kept in batteries in part of the main poultry house until they are four weeks old, and then moved out to the brooder houses. The chick batteries have a capacity of 8,000. Young chicks are put in the top tier and gradually moved down until they are taken to the houses. Beginning early in May, no heat at all is provided in the brooder houses, even on four-week-old chicks.

At the age of four weeks, Mr. Bulkley has a mortality of from three to five per cent, and less than ten per cent mortality up to the time they are put in the laying houses.

Before the chicks are put in, the houses are disinfected by a fire-gun, and once or twice during the brooding season the chicks are turned out on the wire porch, and the wire floor in the brooder house, which is all attached

to frames, is taken out and the droppings cleaned out. Droppings under the wire porches are cleaned out only when the space under the porches is practically filled.

The chickens in the brooder houses get grain in hoppers on the wire porches, while the mash feeders are inside. Mr. Bulkley has found that by this arrangement the chicks eat approximately 60 lbs. of grain to 40 lbs. of mash, although the proportion changes until when they are 8 weeks old they are eating approximately as much mash as they are grain. To do away with any danger of cannibalism, pigkards are put on the pullets when they are nine weeks old.

This summer the main poultry house, formerly an old barn, is being further remodeled to add three more floors, which will give a capacity of 3200 laying hens. This arrangement provides housing space at an unusually low cost per hen. In the peak is a hay track which will be used to elevate feed to the various floors. Each pen has running water. The dropping boards are located in the center of each pen and are screened. They are high enough so the hens can use the floor space underneath. All scratch grain is fed in hoppers. Recently Mr. Bulkley experimented a bit by feeding grain in the litter, but soon discontinued it.

In addition to the big laying house with the chick batteries in the basement and the brooder houses, the farm has several one-story long houses where breeders are now kept. In fact, Mr. Bulkley still uses the first houses he constructed when he started in the business.

Mr. Bulkley also has a few turkeys—that is, if you can call 564 a few. They are also grown entirely in confinement, and the 564 appear healthy and uniform, representing what is left of the 600 that were hatched.

After seeing Mr. Bulkley's farm, one naturally asks, "Is confinement rearing the coming thing, and will poultrymen universally use this system?"

I don't want to answer that question right now. Anyway, it works for Mr. Bulkley.

Sabbatic Leave

By L. E. WEAVER

ONE OF the compensations of a professor is the sabbatic leave. After seven years of service, he gets a change. Apparently the idea is not that he needs a rest, but that he is getting rusty and inclined to run in the same old groove too much. He must get away from his job, see what

L. E. Weaver

others are doing and how they do it, and spend his time in libraries and laboratories. Then, he can return with the rust all polished off to tackle his old job with new energy and enthusiasm.

I have been leading up to the statement that by the time this is being read, I will have started on a sabbatic year. The prospect appears so delightful that I hesitate to tell of it. Already too many are envying me the trip. Can you imagine anything better than a year in Hawaii? Yes, that's it! During the coming school year I will teach poultry to the students in the University of Hawaii. Professor C. M. Bice of that institution will be at Cornell and will take over my desk and my work. He is a native of Michigan and received his poultry training in the University of Wisconsin under the well-known and well-beloved Jimmie Halpin.

Of course, I am going to be at the World's Poultry Congress in Cleveland. From there I am driving to San Francisco with Professor E. A. White who recently retired after many years as head of the Department of Floriculture and Ornamental Horticulture at Cornell. On our way across the country we will visit many places of interest—Pikes Peak, the Grand Canyon, Boulder Dam, etc. I hope to visit the Dryden and Kimber poultry breeding farm in California, and perhaps others. Our boat sails on August 25.

What is going to happen to my column in *American Agriculturist*? I am leaving that up to Hugh Cosline. I imagine he has a number of first-string players on the bench that he will call on. But Hugh has promised to let me send in some impressions of Hawaii once in awhile.

Lightless Laying Tests

You may recall that the two upstate New York laying tests broke all precedents last winter when they used no lights on the pullets. You will be interested in watching the results from now until the end of the year. Egg production has worked out exactly as was to be expected. During the fall and winter months these tests fell far below the leading (lighted) laying contests of the country. Egg production was not poor, but it lacked much of

being what it would have been with lights.

When spring came with longer days, the pullets responded in magnificent style. For a long time now the rate of production at these tests has been well ahead of any other tests. In total eggs, these unlighted pens are still well behind the leaders, but they are gaining rapidly. Each month they pass a few and come closer to the top.

Whether or not they finally overtake the leaders is not important. It is important to know that one more piece of evidence apparently has been added in support of the theory that some of the high mortality among laying pullets has been due to too much artificial lighting. In other years at the laying tests lights have been used, and the mortality has been 20% or more. This year it is 10 and 12% respectively at the two tests to date. One reason for the present abundant egg production is the larger number of birds compared with other years.

Now I hope that no one will say, "that settles it. I'll never use lights on my pullets again." That would be jumping at conclusions without thinking the situation through. In the first place, mortality (most of it) is due to many other causes. Then remember that an egg in November is usually worth two eggs in April. Perhaps you can afford to take a few losses in pullets for the sake of getting more November eggs. Moreover, it is quite possible that with moderate lighting you can get good November production without any increase in mortality.

Let's all reserve final judgment until this year—and another—is finished.

Horace Dryden

A few readers were fortunate enough to hear Mr. Horace Dryden and to see his colored movies on his recent visit to the East. I wish that every poultry keeper could have been at one of the meetings. Two outstanding facts were not mentioned, but stood out so that they hit you right between the eyes. First, the production of modern high producing, disease-resisting, large-egg birds, is complicated and costly. Second, chicks from that sort of stock can't be sold for 6 or 7 cents each.

Professor James Dryden was a pioneer in scientific poultry breeding. I recall a visit to the Oregon Experiment station nearly 20 years ago. Professor Dryden showed us a half dozen 300 egg hens. Nowhere else in the world at that time were that many 300 eggers in existence. Soon after that Prof. Dryden went to California and established a breeding farm with White Leghorns and Barred Rocks. Today, his son, Horace Dryden, carries on with about 8,000 birds. His birds are regular winners at laying tests and he is firmly established as one of the country's foremost poultry breeders. It has been a pleasure and an honor to have had him and Mrs. Dryden in our midst.

Persuasion for "Setters"

What should be done with broody hens?

If it is a first offender, it will probably pay to give her another chance. Confine her immediately in an airy slatted coop. Give wet mash, water and green feed. No hard grain should be fed. Always mark all broody hens with a special colored leg band (Prof. Rice suggests that yellow is appropriate). Second offenders will be detected by the yellow band. Sell them to the market, or eat them. Broody hens are always in good condition when they first go broody.

"Her mother was frightened by a Billy goat before she was born."

BABY CHICKS

Hall's Chicks
Leghorns-Reds-Rocks-Wyandottes
New Hampshires-Mallcross (Crossbred) Chicks

All chicks produced from flocks tested for Pullorum Disease (B.W.D.) by the Official State testing agency of one of the six New England States, with NO REACTORS FOUND. Tube Agglutination tested within the preceding calendar year.

"WELL BRED from WELL BREEDERS"

"Never a week without a hatch" since 1927. Pullorum Free by State Test since 1928. Quality chicks since 1911. Catalogue free. We ship prepaid, and guarantee 100% live delivery.

HALL'S Chicks have been selected by the Agricultural Committee for the POULTRY FARM OF TOMORROW at the New York World's Fair, 1939.

FOR YOUR Cookie Jar

BY MRS. GRACE WATKINS HUCKETT

(EDITOR'S NOTE: This is the extra "lesson" on cookies, requested by hundreds of contestants in our recent American Agriculturist Cooking School.)

COOKIES are just small cakes after all and therefore fall into the same classifications that cakes do—butter and sponge. The chief difference is in amount of flour, cookies requiring more than cakes do, yet not enough to make them hard. Cake flour behaves in cookies as it does in cakes: containing less gluten than bread flour does, it gives a more tender product.

The way the dough is handled also has much to do with the final result. In addition to having a good recipe, the following points may well be observed:

- 1—Sift flour once before measuring.
- 2—Make accurate measurements of all ingredients, level cups, etc.
- 3—Handle lightly and deftly without using undue pressure either in mixing or rolling.
- 4—Chill stiff doughs to be sure that moisture is absorbed and fat hardened; this prevents stickiness. Stiff doughs may be rolled, made into little balls and patted flat, or stored in refrigerator and sliced thinly.
- 5—Roll only a small amount at a time and save trimmings to be rolled together at the last.
- 6—Dip cutter, knife or wheel in flour, cut shapes as close together as possible.
- 7—Do not crowd on the cookie sheet.
- 8—Handle with broad knife or spatula to prevent breakage.
- 9—Cool quickly, without piling, on cake rack or clean towel and store in tightly covered crock or bright tin to keep fresh.
- 10—Store all soft and crisp cookies in separate containers.

The butter cake method of mixing is most commonly used in making cookies; cream the butter, add the sugar and beaten egg, then the dry ingredients sifted together and added alternately with the liquid. In the case of drop cookies, the exact amount of flour is given in the recipe. For rolled cookies an approximate amount is usually given, as flours vary greatly in their absorption of moisture. A much less used method of mixing cookies is the pastry method. In this, the fat is cut into the flour, the sugar is beaten into the eggs, then the two mixtures combined with the liquid. Another method of mixing is called the molasses method; in this, the fat is melted in the hot molasses; the eggs and dry ingredients are added to this mixture which is then chilled before rolling.

It should be remembered that addition of liquid, either milk or water, tends to make a soft rather than a crisp cookie. Cookies resulting from the sponge cake type mixture are such cookies as meringues, kisses and macaroons. Time and temperature used in baking cookies depend upon the kind of cookie it is, whether it contains much egg, fat or fruit, or how thin it is.

A good cookie sheet allows free circulation of hot air in the oven and has no sides to prevent even browning. Lacking a cookie sheet, one may get satisfactory results by using an inverted bread pan. Most sheets or bottoms of baking pans need to be brushed with fat, and then brushed lightly before putting on each new batch.

A pattern recipe is as useful for cookies as it is for bread or cakes. By practicing it until results

are certain, it is then very simple to vary the pattern recipe by adding nuts, fruits, and decorations to fit any occasion.

PATTERN COOKIE RECIPE (30 to 40 cookies)

$\frac{3}{4}$ cup fat	3 cups flour
1 cup sugar	3 teaspoons baking powder
2 eggs	$\frac{1}{2}$ teaspoon salt
$\frac{1}{2}$ cup milk	1 teaspoon vanilla

Cream the fat, add sugar and mix thoroughly. Add beaten eggs and milk. Sift flour, baking powder and salt together and add to first mixture. Toss the dough on a floured board, roll it thick or thin as desired. Cut into desired shapes; place cookies on greased cookie sheet and bake in a 400°-425° oven 10 to 15 min.

Variations:

Sugar Cookies: In pattern recipe omit vanilla and add $\frac{1}{2}$ teaspoon lemon extract and $\frac{1}{4}$ teaspoon nutmeg. Sprinkle granulated sugar over top before baking.

Cocoanut Cookies: To pattern recipe add $\frac{1}{2}$ cup shredded cocoanut. After rolling out dough, sprinkle cocoanut on top and roll again lightly before cutting out cookies.

Nut Cookies: To pattern recipe add $\frac{1}{2}$ cup of chopped nuts of any kind, or grapenuts; or put $\frac{1}{4}$ or $\frac{1}{2}$ nut on top of each cookie.

Chocolate Cookies: To pattern recipe add 2 1-oz. squares of melted chocolate. Use 1 tablespoon less of fat.

Butterscotch Cookies: Substitute brown sugar for white, packing it into the cup. Use all butter for shortening.

Sour Cream Cookies: Use pattern recipe, but substitute 1 cup thick sour cream and $\frac{1}{2}$ teaspoon soda for fat and milk. Thickness of dough may be varied just as indicated for pattern recipe.

Fancy Decorations: Sand sugar, sometimes called confetti, in various colors, silver, chocolate or colored candies and frostings of various kinds, are now available in most grocery stores or from the mail order houses. Cocoanut may be tinted by sprinkling lightly with vegetable coloring diluted with a little water.

Filled Cookies: Place a teaspoon of filling on a cookie, not allowing it to spread to the edge, place another cookie on top, press down the edges, bake in shallow pans. For the filling:

$\frac{1}{2}$ cup sugar	1 cup chopped raisins,
1 tablespoon flour	dates, figs, prunes,
$\frac{1}{2}$ cup water	apricots or marmalade

Mix flour and sugar together. Add to the other ingredients. Cook until thick, stirring constantly.

EMERGENCY COOKIES

Spread sandwich fashion between graham crackers the following icing which may be kept in a tightly covered jar in the refrigerator for a few days. This quantity makes 18 "sandwiches". It is best to spread just before serving; otherwise crackers may become crumbly if kept more than $\frac{1}{2}$ day.

4 tablespoons butter	2 cups confectioners' sugar
1 egg yolk	1 teaspoon vanilla

Cream butter, add egg yolk and beat thoroughly. Add gradually the sugar and flavoring.

—Photo by Ewing Galloway.

Every farm pantry has its cookie jar, filled with fresh, home-made cookies. You can easily add variety to the contents of yours by trying some of the delicious variations of the standard recipe given by Mrs. Hockett on this page.

MACAROONS

White of 1 egg	1 cup nutmeats
1 cup sugar	$\frac{1}{4}$ tsp. salt
	$\frac{1}{4}$ tsp. almond extract

Beat white of egg until stiff; add sugar gradually, beating constantly. Fold in finely chopped nutmeats, sprinkled with salt. Drop from tip of spoon 1 inch apart on greased sheet; bake in moderate oven 350° F. for 10 to 12 min.

Variation: Shredded cocoanut, grated hazelnuts or dry cereal may be used in place of the nutmeats. Furthermore brown sugar may be substituted; in this case omit almond extract.

OLD-FASHIONED SOFT MOLASSES COOKIES

8 cups sifted flour	1 teaspoon cinnamon
4 teaspoons soda	3 cups molasses
$\frac{1}{4}$ teaspoon salt	1 cup lard, melted
1 tablespoon ginger	$\frac{1}{2}$ cup butter, melted
	$\frac{5}{6}$ cup boiling water

Sift together, three times, the soda, salt and spices with 4 cups of flour. Combine molasses, melted shortening, and boiling water and then add this to the mixture of flour and spices, blending them well. Add remaining 4 cups of flour gradually. Let dough stand in a cool place for 1 hour. Turn the dough onto a lightly floured board, roll it $\frac{1}{4}$ inch thick, and cut with a floured cookie cutter. Bake in a medium oven 375° F. for about 12 to 15 min.

cap sleeves are adaptable to wear now or to school later. Pattern sizes are 2, 4, 6 and 8. Size 4 requires 1½ yards of 39-inch material, 2 yards braid for cap-sleeved version. The gay flower applique is also included.

TWO-PIECE FROCK PATTERN No. 2925 would make a lovely summer outfit with white sharkskin jacket and flaring plaid skirt or a stunning school frock in a new fall combination of rose over moss green for instance. Sizes are 12 to 20. Size 16 requires 1½ yards of 39-inch material for the jacket; 2 yards of 39-inch for the skirt.

HAT PATTERN No. 2567 includes the beguiling sunbonnet illustrated and a sophisticated turban. One size. Bonnet requires ½ yard of 35-inch material.

TO ORDER: Write name, address and pattern size and number clearly and enclose 15c in stamps. Address Pattern Department, *American Agriculturist*, 10 North Cherry St., Poughkeepsie, N. Y. Add 12c for a copy of our new fall fashion catalog.

Seven Ways to Serve Green Peas

By H. R.

Farm Pea Salad

Soak 1 tablespoon granulated gelatine in ½ cup cold water for 5 minutes; add ½ cup hot water, stir until gelatine is dissolved. Add ¾ cup orange juice, 1 tablespoon lemon juice and 2 tablespoons sugar. Chill and add 2 cups cooked peas, 1 cup diced veal and 3 sliced hard cooked eggs. Pour in mold and let set. Serve unmolded with mayonnaise.

Peas Supper Dish

Slice 6 large cold boiled potatoes, grease baking dish and place the potatoes in alternate layers with 3 cups cooked peas. Season with a chopped onion and 2 tablespoons butter, adding salt and pepper to taste. Pour over rich milk to cover and bake 25 min. in moderate oven.

Pea Shortcake

Cook 4 cups peas in little salted water until tender, add rich cream to cover peas, also 1 teaspoon salt and a dash of pepper. Simmer through; add 2 tablespoons chopped parsley and pour over hot, split baking powder biscuit to make individual shortcakes.

Creamed Peas and Eggs

To 3 cups cooked peas add 6 sliced hard cooked eggs together with 2 cups thin white sauce. Heat well, pour over buttered toast and sprinkle with cheese.

Pea Loaf

Mix 3 cups cooked peas with 1 cup cracker crumbs; add 2 beaten eggs and 1½ cups milk. Season with 3 tablespoons melted butter, also salt and pepper. Bake in moderate oven in loaf pan 30 min.

Peas and Bacon

Cook 1 quart mature peas until tender in salted water. Fry 6 bacon slices (cubed) until crisp; add 2 minced onions and ½ cup vinegar to ½ cup of the bacon fat. Pour over peas and serve garnished with the crisp bacon cubes. Men like this extra well.

Look CRISP and COOL!

TO KEEP that "lettuce look" on wilting summer days makes one look to her materials and her colors. Thin, crisp organdies, lawns and tissue ginghams, dimities and sheer voiles in cool blues, greens and lavenders or in the muted, dusty shades of pink and rose, help to achieve this effect. Not all summer days are wilting, however. Cooler August evenings and cloudy days call for clothing with a feeling of snugness either in weight or in color. You need both kinds of dresses in your wardrobe.

CHILD'S DRESS AND PANTY PATTERN No. 2509 is full of refreshing charm for the little girl. Puff or

"I guess Miss Betty's visiting her Grandpa again! We got flowers on the table."

"I MARRIED A JELLY CHAMPION!"

SAYS

Joe E. Brown

JOE E. BROWN
starring in the new
Paramount picture
"\$1000.00 A TOUCHDOWN"

NO COSTLY FAILURES FOR ME! I USE THE "TRIED AND TRUE" PECTIN... CERTO!

Look for the tested recipes under the label of every bottle of Certo—a product of General Foods.

MRS. V. J. DANIELS of Laurel, Montana, whose Certo-made jams and jellies won 7 prizes at the 1938 Midland Empire Fair. Like 3 out of 4 jelly champions, Mrs. Daniels always sticks to Certo!

WHY 3 OUT OF 4 JELLY CHAMPIONS STICK TO CERTO:

1. Certo is the "tried and true" pectin that takes the guesswork out of jelly-making!
2. Certo alone gives 79 tested recipes—a separate one for each fruit!
3. Certo reduces boiling time to ½ minute for jellies—only a minute or so for jams!
4. Certo jellies retain fresh fruit flavor—no "boiled-down" taste.
5. Certo gives you half again more glasses—makes all fruits jell perfectly!

Insist on **CERTO** THE "TRIED AND TRUE" PECTIN THAT TAKES THE GUESSWORK OUT OF JELLY-MAKING!

Elder Witham's Big Squash

IT WAS Monday afternoon of county fair week, and we were very busy getting our farm exhibits ready to send the next morning. Among other things to be done that afternoon, Addison and I had to go to mill, three miles from the old farm, with a grist of corn for the herd, pigs, colts and poultry during the fair.

We found six or eight other grists ahead of us at the mill, however, and the miller told us that he could not get ours out for us before nine o'clock that evening. So, rather than wait, we concluded to drive home and come back for it later.

On the way we overtook Alfred Batchelder and Newman Darnley, two young neighbors of about our own age, with whom we were not on the best of terms. They had been fishing for pickerel over in the mill-pond.

As we were driving with an empty wagon, I thought it would look better to invite them to ride; and so we pulled up and asked them to get in.

Although they seemed a little surprised, they accepted the invitation.

As we drove along we passed Elder Witham's little place, where he and his sister, Aunt Olive Witham, lived; and we caught sight of the elder out in his garden, looking at his big squash.

Everybody in town knew about the elder's squashes. They had been the pride of his heart for six seasons. He made the ground for them very rich with all sorts of fertilizers, and thus urged them forward to tremendous size for exhibition at county and state fairs. He allowed but a single squash to ripen on one vine; and during July, August and the early part of September it was his daily practice to "water" the different sets of rootlets along the whole length of the vine with milk.

He raised the largest squashes ever produced in Maine. One which he took to the state fair the year before actually tipped the scales at a hundred and seventy-four pounds. It was thought that this one was even heavier.

There was little real advantage in producing such mammoth squashes; they were watery, coarse-grained, and not of much use for the table. But the elder had the squash craze. On very hot days in August he shaded the vines slightly; and after frosts began to come in September, he made a tent over them at night with bedquilts.

"There's the old elder out there looking at his big squash," Newman said, as we drove past. "I guess he is going to pick it today to take to the fair."

"No, he isn't," Alfred said, "for he's got his milk-pitcher in his hand. He is giving that squash another drink of milk. He won't pick it until tomorrow."

The elder heard us passing, and we fancied that he scowled. He was not in much sympathy with boys. We considered him austere, not to say harsh; but he was a man of high moral character, upright and conscientious.

"Wish somebody would carry off that big squash of his tonight!" Alfred exclaimed, laughing.

"So do I!" cried Newman. "Wouldn't the elder have a fit?"

"Well, I wouldn't want to be the one to lug it off," said I. "It is more than a man could lift."

Thereupon Addison glanced back with a queer look, and said:

"You might blow it up, Newman. What do you suppose the elder would say if somebody were to put a charge of powder into that big squash of his and touch it off?"

But he laughed when he said it, and I for one had no thought that he really meant such a thing. It was merely one of those mischievous ideas which sometimes pop into our minds.

At the post office they left us; we went on home to the farm; and late that evening Addison drove to the mill again for our grist. He went alone.

The next morning we were all astir early, and by eight o'clock set off with our herd and our loads of exhibits for the fair-grounds. But even while we were on the way we began to hear rumors that something mysterious had happened overnight to Elder Witham's big squash! It had exploded because it was so big and overgrown some said.

Everybody for miles around was expecting to see that squash at the fair, and before noon hundreds of people were inquiring about it. Toward noon,

By C. A. STEPHENS

too, the elder himself appeared at the fair-grounds, his jaw hard set and wrath in his eye. "Some son of Belial has destroyed my squash with gunpowder," he replied, sternly, to all questions. "The finest squash ever raised in New England, too! What's this generation coming to?"

Addison and I felt a little queer about it from the first, owing to what had passed the day before, but we said nothing.

Newman Darnley and Alfred Batchelder were at the fair, and we heard that they were telling everyone they knew that they had heard Addison and me declare that we were going to blow up the elder's squash.

Before night Ad and I were marked characters at the fair. We could see that people were looking hard at us, some grinning, others with looks of reprobation and dislike. We drove home that evening in anything but a comfortable state of mind.

Nor was home a sanctuary. The old squire had heard the rumors going at the fair, and so had Theodora and Ellen. After supper the old gentleman rose and started for the sitting-room. "Boys, I want to speak with you," he said.

Addison and I followed him, knowing very well what was coming. The old squire shut the door. "I want to

know the truth about this," said he. "Did you destroy Elder Witham's squash?"

"No, sir," we both said.

"Do you know anything about it?" he insisted.

Thereupon Addison told him what had been said on our way home from the mill.

The old squire sat regarding him closely. "And after that you went back past there alone late last evening?" he said.

"Yes, sir," Addison admitted.

The old squire took a turn across the sitting-room. "Things look black against you," he said. "But you have never told me a falsehood yet, and I believe you."

He had hardly said this when we heard Elder Witham's voice and Aunt Olive's out in the other room. They had just driven over, and were not in an amiable mood. They had heard what Alfred and Newman had said, and their minds were made up.

"Well, young man, you're caught!" were the elder's first words to Addison as we came out. "You may as well own up! You're cornered. Now what have you got to say for yourself?"

"But I didn't do it," Addison managed to say.

"O-r-r-rh!" exclaimed the elder, incredulously. "None of your wrong stories. It will be far better for you to own right up. Better and safer, too!"

The case was prejudiced; and the old squire sent us out of the room to do the evening chores at the stable. He then attempted to go over the matter more calmly with our aggrieved callers—without much success.

Addison and I heard what was said as they drove away. "Now mind you, squire, unless that grandson of yours owns up, I'll have him arrested!" the elder exclaimed. "A boy mustn't be allowed to do a thing like that and not be punished."

The next day Addison and I stayed at home and dug potatoes. Ellen and Theodora also preferred to remain at home. The scandal and notoriety were too much for them to face.

It was at this bad pass of our affairs that these good girl cousins of ours bore a hand to save our reputation. Aunt Olive had always liked them; they often visited her; and the following afternoon went to see her.

At first Aunt Olive was very stiff with them and inclined to be implac-

The Amateur Poet's Corner

Because of the number of contributions, we do not return poems not published. Keep a copy of your poem.

The limit in length is sixteen (16) lines and poem must be original and written by an amateur. \$2.00 will be paid to the author of each one printed. Check will be mailed on or about first day of month following publication.

Crops

How are your crops? Has the corn grown tall?
Will the barns and silos be full this fall?

Has it been too dry, are the nights cold yet?

Or has it been dark and the ground too wet?

How are the spuds, were the bugs too thick?

Has a hail storm come, do the crops look sick?

We're raising a crop that the weather can't faze,

Whether it's cloudy or warm sunny days;

For there's coasting or wading or romping in hay,

No matter what comes there's a good chance to play

With much joyous laughter and lots of gay noise—

For the crop we are raising is four little boys!

—Mrs. May H. Jimerson,
R. 4, Corning, N. Y.

able; but at last she invited them out into the garden to see the "ruins" of the big squash.

Cousin Ellen was a keen-eyed girl. While looking about, she caught sight of a little glitter of glass amidst the deep green of a bed of carrots a few feet away from the squash vine. She went to see what it was, and found just the neck and shoulders of a little glass vial—an ounce vial. In the neck was a small wooden plug, and in a crease of this plug was a bit of burned fuse, such as is used in blasting rocks.

She picked it up and showed it to Theodora. Thereupon they both began looking about more attentively, and examined the broken parts of the big squash, with the result that in the soft inside portions of it they found the bottom end of the same broken vial, and also in another part a piece of the side of the vial, to which was still sticking a red label with the printed word "Poison" and the familiar druggist sign of a skull and bones.

On the discolored label, too, was a part of the word "Belladonna," and beneath it another word, "Crane's," which made it evident that the vial of belladonna had come from Crane's drug-store at the village.

Ellen wrapped the fragments of glass up in her handkerchief and put them in her pocket.

Meanwhile Theodora had espied something else of interest—about an inch and a half of the end of a thin, slim knife blade, lying in the earth close by the squash, along with two or three burned matches.

In that vicinity the farmers cut and dried a great many apples in the fall of the year, and for slicing the apples a thin-bladed knife was used, called a "slicer." This bit of blade was plainly broken off from one of those knives.

Theodora also pocketed that. They brought their trophies home, and at the supper table that night we all put our heads together over them. It was not difficult to understand what had occurred. Whoever blew up the elder's squash had put the powder in that ounce vial, to keep it dry in the moist inside of the squash, and had touched it off with a bit of fuse.

To introduce the vial within the

The Song of the Lazy Farmer

I TOOK one look at that Fair and I wired to the hired hand to sell another cow and send the money here for us to spend. That World's Fair is so big and wide I knew there wouldn't be no hide upon my feet within an hour if I walked round on my own power. We didn't git so very far at seein' it in our own car, they made us park so far away it takes the best part of a day to git ourselves moved up from there to where we start to see the Fair. So we got us a little cart, a feller pushes it right smart from here to there, and so we see the sights in comfort, tho, by gee, it costs us just a buck an hour to travel round by human power.

But then at twice as much, this seat is worth the price, for when your feet are hurtin' you, you can't enjoy the sights, it surely does annoy a feller when his bunions ache, so since we're here, why we will take and blow the money from that cow. We'll have a good time anyhow, and if we're broke when we git back we'll live a while upon a snack. But while we're here we'll have some fun and not be stingy with our mon, we'll take in all the sights there is, and if the folks at home, gee whiz, could see us by the Perisphere they'd all pack up and join us here!

squash, too, they had been obliged to cut a little hole through into the seed cavity, and for that they brought one of these apple knives. The outer rind and meat of the big squash had proved so hard and thick, however, that in their efforts to cut it they had broken a piece off the knife blade, which they could not find in the dark.

Not to show ourselves too much in public, Addison and I remained at home and dug potatoes, while Ellen proceeded to make certain innocent-seeming inquiries among our neighbors.

At first she attempted to borrow a little belladonna at every house, but learned that no one thereabouts had, or had had, any belladonna, except the Wilburs. Mrs. Wilbur had bought some in an ounce vial at Crane's drug store a year before, but she told Ellen that she had let Mrs. Batchelder have what was left of it.

When Ellen called there to ask for it, Mrs. Batchelder said that she had

want to trap them. You two boys had better dig potatoes another day, and let me take a hand."

The way the old squire took a hand was by hitching up and driving first to Elder Witham's for a talk with him, and then all about among our neighbors and acquaintances.

"This is a serious matter," he said to them all. "A cowardly trick has been played on Elder Witham. We want to go to the bottom of it and find out the facts. So let's get together at the schoolhouse this evening and try to learn the truth.

"My two grandsons had something to do with it," the old gentleman admitted. "Addison has a confession to make."

More than two hundred people gathered at the schoolhouse that evening, Alfred and Newman with the rest.

The old squire called the meeting to order, stated the object of it again and described the outrage committed in the elder's garden. He then bade Addison relate what had occurred the previous Monday afternoon on the way home from mill.

Thereupon Addison took the floor, and "confessed" what he had said to Newman and Alfred about putting a charge of powder in the squash.

There was an uneasy stir of disappointment in the throng. "Who did it, then?" some exclaimed.

"Well," replied Addison, smiling, "girls sometimes make good detectives. Our girls here have been doing detective work for us—and they have found out who did it."

There was another stir, and we saw Alfred and Newman, who were sitting together, glance at each other.

"We have the proofs right here," Addison went on. "Anyone can see them who wants to." And he laid out the bits of vial and the knife with the broken blade on the teacher's desk beside him. "Here is the broken belladonna vial they put the powder in, to blow up the squash. Alfred Batchelder knows where that vial came from. It is the only belladonna bottle in the neighborhood. He took it that evening from his mother's cupboard.

"And here is the apple knife with which they tried to cut a hole in the big squash to put in the vial of powder," Addison continued, triumphantly. "They broke the knife blade. The knife came from Newman Darnley's house. He took it that night from his mother's pantry and put it back there afterward. But the piece broken off the blade was found in Elder Witham's garden close beside the big squash. It fits exactly as you can see your yourselves. It was a pretty mean trick. But the rogues are caught. There they sit."

Alfred and Newman, however, were no longer sitting there. Before Addison had finished speaking they were on their feet, pushing through the crowd to get out of the schoolhouse.

But the old squire had had his eye

on them all the time, and stepping to the door, now barred the way.

"Not too fast, my boys!" he exclaimed, grimly. "You are going to stay right here till you own up to this!"

And that is what they had to do, although they did it with very bad grace. They were chaffed and derided without stint, and if I recollect aright, their families paid Elder Witham twenty dollars.

The elder and Aunt Olive afterward apologized to Addison, but I always thought that he was a little to blame.

Today in Aunt Janet's Garden

Not Too Hard to Root Cuttings

NOW WHEN many of the garden bedding plants are growing leggy and nights grow shorter and cooler is a good time to make cuttings for next winter's house plants.

I have rooted some cuttings simply by sticking them into a pot of soil where another plant was growing. This works with such plants as Japanese rubber plant or crassula, Christmas cactus, coral cactus and occasionally with chrysanthemums. But a better soil mixture for forming roots is a good grade of mason's sand, sharp, moderately coarse and free from loam and vegetable matter; for azaleas, rhododendrons and other evergreen cuttings a mixture of half sand and half peatmoss is better than the pure sand. A box or other receptacle at least 4 inches deep may be filled with the sand, tamped down and thoroughly soaked with water. For very choice cuttings a square-sided aquarium is recommended, since a pane of glass over it helps to retain moisture.

Another rooting device which I have seen is a flower pot filled with sand in which a smaller flower pot is sunk so that the pot is level with the sand. The hole in the small pot is stoppered, the pot filled with water so that it seeps through the porous part and keeps the sand uniformly moist.

The commonest plants which most of us like to root are English ivy, heliotrope, lantana, geraniums, petunias, coleus, periwinkle, impatiens, begonia, and fuchsia. From these plants which should be free from insect and disease pests—we take growing tips about 4 inches long, with not less than 3 sets of leaves. Just below the node is the place to make a sharp diagonal cut, then remove the lowest set of leaves. Stems which are not too soft or succulent are not so apt to rot; those which are older and brittle enough to break clean when bent double are best. If the leaves are large, as with coleus, it may be wise to cut away small sections from the larger ones. Prevent wilting by putting the cuttings in cold water for ½ hour except for geraniums or other milky-juiced plants. These are sprinkled with water and spread out to dry in order for the stems to heal themselves.

The rest is easy. Bore a hole in the soil with a pointed stick, insert the cutting, so that one or two nodes are buried, then firm the sand around it. Water thoroughly and shade carefully for the first few days.

A lath cover over the box to allow circulation of air is excellent. Other people resort to a cheesecloth cover which may be tipped or removed entirely according to weather. After 3 or 4 weeks the plant should show new growth. When roots have become about ½ inch to 1 inch in length, transplant into pots containing a sandy loam which has some leafmold mixed in with it. After the plants have recovered from this moving, a little complete fertilizer may be scratched and watered into the soil.

The Old House

By ROBERTA SYMMES.

I think an old house holds so much
Of what has dwelt within
Through all the passage of the years—
The dramas that have been
Of storm and sunshine, joy and grief,
Of laughter and of tears.
I think an old house holds so much
Of living through the years.

I think an old house holds so much
Of happenings long ago,
As suns when sinking in the West
Leave long an afterglow.
Homes should be filled with kindness,
With love we should enfold,
So only precious memories
An old, old house may hold!

it, and went to a cupboard to get the vial, but to her surprise could not find it anywhere!

The belladonna vial was thus traced to the Batchelders' cupboard—whence it was now unexpectedly missing!

Two days later Theodora took up the quest. She went to six places, the Darnleys' among the rest, ostensibly to borrow a slicer apple knife—in fact, she came home with six slicers. When she called at Mrs. Darnley's, the latter said that she had one, and went to get it from her pantry, but was much surprised to find the blade broken.

"I don't see how my knife got broken!" Mrs. Darnley exclaimed. "I was using it only a few days ago. It wasn't broken then."

"Well, you can take it," she added. "Perhaps you can work with it, even if the end of the blade is gone."

Theodora brought it home, and we fitted the bit of broken blade to it. It fitted perfectly and had beyond doubt been broken from it.

Addison and I were now jubilant. But the old squire said, "Keep quiet a bit. Don't crow out loud yet. We

"Did yuh, get his number, Elmer?"

Kernels, Screenings and Chaff

By H. E. BABCOCK.

THE CLOUDS are gathering in the sky and once again there is promise of rain. If rain comes it will have an immediate effect in lifting your spirits and mine.

If enough of it comes, there is yet time for a very considerable recovery for the crops in the Northeast. Meadows which are lying brown and bare may yet produce a second crop of hay. Many fields of corn will be saved. Pastures will start up. Cash crops, like potatoes and cabbage, will benefit. Even if it does come abundantly, however, rain will be too late to cancel hundreds of thousands of dollars which already have been lost by farmers of the Northeast or to restore a loss which has not yet become apparent but which will lay a heavy burden on next year's operations.

NEW SEEDINGS LOST

I refer, of course, to the hundreds of thousands of acres of new seedings which were put out with winter and spring grains and which already are a total loss. The problem of how to restore lost grass seedings this year or to get by next year without the hay which they would normally produce is a challenging one not only to individual farmers but to the

We call this street "Pullet Place". It is located on our Larchmont Farm. We load up the brooder houses shown in the picture three times a year, January, May, and September, with pullet chicks. The range houses shown between the brooder houses are drawn out on range and used to get the January brood of chicks out of the way of the May chicks.

There are three hedge rows like the one shown in the

picture on Larchmont Farm and we plan to move our pullet-raising equipment into the shadow of a fresh hedge row each year until all three locations have been used and then repeat the circuit.

At the time the picture was taken there were 1500 half-grown pullets in the houses but not a bird can be seen because it was midday and all of them had taken advantage of the shade of the hedge row to keep cool.

agricultural leadership of the entire Northeast.

If ever there was a conservation problem in the Northeast, the maintenance of grass seedings is it. Right now this problem is of an emergency nature. *With Congress having appropriated millions of dollars for Agricultural Conservation, it would seem to me that it would be entirely reasonable to earmark a certain amount of these appropriations for the restoration of the grass seedings of the Northeast which have been ruined by this summer's drought.*

CHEAP GRAIN

The Federal Surplus Commodities Corporation is today the owner of millions of bushels of grain, largely corn, upon which it made one-way loans to farmers. Another enormous corn crop is on its way. Presumably something will have to be done to

market the surplus. There are indications that any foreign people can come to the United States and buy cotton and corn at figures substantially under the domestic market.

Meanwhile the poultrymen and the dairymen of the Northeast need feed badly. *Common justice would seem to indicate that, before the Federal government dumps a lot of corn abroad, it might well give serious consideration to furnishing some feed at bargain prices to drought stricken Northeastern farmers.* Perhaps the two-price system which is claimed to be working so successfully in the distribution of surplus foods in cities might be adapted to placing several million bushels of corn on Northeastern farms.

SUMMARY

Many grass seedings have failed in the Northeast. It would seem logical that benefit payments might be made available to help farmers re-establish these seedings both as a matter of aid to them and of wise public policy in protecting the chief resource of the agriculture of the Northeast.

Northeastern poultrymen and dairymen are short of feed. The government has a troublesome corn surplus on its hands which must be dumped. Why not give the Northeastern farmers the benefit of this situation? They certainly have as much right to profit by it as a Chinaman, an Italian, or a Spaniard.

* * *

Ever Normal Hay Mow

Two years ago when Secretary Wallace's "Ever Normal Granary" was receiving a good deal of publicity, I announced that at Sunnysables we were going to set up an "Ever Normal Hay Mow." At the time there was some critical comment on this announcement by farm economists and others but this did not bother me much because with hay at \$5.00 or \$6.00 a ton I could

not see where we were taking much risk in accumulating a back log of it.

This season we have cut a fair first cutting of hay but our second cutting is an absolute failure. There is also a chance that we will not fill our last silo as we planned with a mixture of soybeans and corn. Under these circumstances our carry over of some thirty odd tons of hay is the only thing which is going to keep us from having quite drastically to modify our livestock program.

The more I see of Northeastern agriculture the more convinced I am that our real source of wealth lies in our pastures, our stands of hay, and our hay mows. If we can keep in a position where we always have pasturage and roughage, I have an idea that year in and year out we can safely depend upon the rest of the country for our supply of concentrates. This is what we do by and large anyway, with the result that the situations which seriously upset us are a failure of our pastures or lack of hay.

* * *

Hogs Up

At Sunnysables we have been somewhat encouraged by the recent slight upturn in the hog market. We have around 50 shoats in our feed lot which we are finishing off on winter barley. We also have six sows bred to produce early fall pigs.

All summer we have debated whether or not to continue to keep our small herd of sows while pork prices are as low as they now are and threaten to be during the next two or three years. We have not arrived at any definite conclusion. We can carry our sows very cheaply. We pasture them in the summer and feed them largely on grass silage in the winter. They only get grain when they are nursing litters. As a matter of fact our pig account has shown up so well during the last three years that it can stand a year or two of low prices without going into the red.

* * *

They Test Clean

We have just gotten back our report on our second Bang's test of the Hereford heifers we bought in Texas this spring. The report covers 47 head and there is not a single plus mark on it. It must be very satisfying to the cattlemen in the Davis Mountain area of Texas not to have to contend with either tuberculosis or Bang's disease in their cattle.

The colt in this picture is not yet 24 hours old. He is knobby and awkward and still uncertain in his movements but he has the constitution and the bone and the vigor necessary to grow into a big, useful animal. We got his mother through the Burlington County Supply & Produce Company of Mt. Holly, New Jersey, which, this spring, shipped a full carload of matched sorrels with white tails and manes. Her mate is also scheduled to foal in the near future.

Worthless Stocks

Where much for little is the bait,
Show stock salesmen to the gate.

MANY of our subscribers own worthless stocks. That is unfortunate, but in some cases it leads to a situation where they lose still more money. That is still more unfortunate.

Have no dealings with the stock-selling agent who offers to sell you stock and take the worthless stock you already have as a partial payment. The chances are that the new stock is just as worthless as the old, and the whole transaction might be characterized as throwing good money after bad.

An earmark of the lack of reliability is the urge for haste. Such a man is apt to tell you that the proposition must be accepted today. One subscriber, who refused to be hurried but who seemed interested enough to arrange another meeting, explained the proposition to the police and helped them to arrest two crooks that the authorities were very anxious to see.

Frequently, however, a man may sell you worthless stock without committing a crime. When you buy stock in a company, you do so on the belief that the company will make money. The promoters may be entirely honest, yet their profits may be nil. A rule followed by some investors is to buy no stock except that listed on a stock exchange and in companies which have been established long enough so that they have a record of having paid dividends over a period of time. The advantage of this is that should you happen to want to turn the stock into money, you can do so on any day at the market price. Once you have bought unlisted stock it is extremely difficult to sell it if it does not pay dividends.

The American Agriculturist Service Bureau does not attempt to give advice on financial matters. These are merely a few fundamentals which we are glad to pass along to our readers.

Cattle Signs

Is there a law in New York State requiring signs indicating cattle passes across the road?

We referred this question to the State Department of Agriculture and Markets, and received the following reply from the Counsel of that department:

"We do not find any law requiring the posting of signs where cattle cross a highway. It is our understanding that no standard method of posting cattle crossing signs has ever been devised. It would appear that those farmers who have posted signs showing 'Cattle Crossings' have done so for their own protection and protection of the cattle, and likewise for the protection of the travelling public. However, no statute has ever been passed controlling the question."

Do You Know Him?

"On May 10th a well dressed man came to see us about buying some uniforms for the men in our plant. We gave this man our check for \$4.00 as deposit on an \$11.50 order for uniforms, but we did not receive them. We notified the company and were informed that Mr. J. M. Dixon was not a representative of their firm, and our order was never received."

If any of our readers have been contacted by J. M. Dixon who claimed to represent the John C. Mason Company of Chicago, Illinois, please let us know. Mr. Dixon is about 55 years old, short and stocky, and very well

dressed. He carries receipt books and order books issued by the John C. Mason and Company, 330-06 West 23rd Street, Chicago, Illinois.

Lost, Strayed or Stolen!

Mr. Edwin L. Hunt, Cuba, New York, reports that one of his cows disappeared from his pasture on May 16th. The description of the animal is as follows: Black and white (more black than white), average size, right flank white, her front and back teats on the right side were hung very close together and were black in color. She was about 8 years old, due to freshen about May 16th. Her ear tag when she disappeared was No. 97648. She had been dehorned and had a white mark on forehead. Valued at \$75. Mr. Hunt will appreciate any information.

Policy Cancelled

"I have been carrying a sick and accident policy for twenty years. Now the company has cancelled it. Can they do this?"

Most sick and accident policies carry a clause stating that the company can cancel it, and quite frequently they do so, if the insured has a disease which is likely to be recurrent. They cannot cancel while the insured is drawing indemnity but they can at any other time by returning the advance premium that has been paid.

There are a few companies putting out a non-cancellable sick and accident insurance policy. The policy is likely to cost a little more, but you can readily see that it has distinct advantages.

Returns \$635,956 in Stock Frauds

The securities bureau of New York's law department, reporting the most active year in its history, obtained restitution of \$635,956 for defrauded investors during 1938, Attorney-General John J. Bennett, Jr., said recently.

In his annual report, Bennett revealed the bureau won 351 injunctions against individuals and firms engaged in sales of fraudulent securities.

"At no time in the history of the bureau," the attorney general asserted, "have there been so many cases of great magnitude and public interest as during the last year."

Cement Floors in Stables

Is it true that all dairy farmers must replace all wood floors in stables before November 1? A number of farmers in this vicinity have received such a notification, but it did not come directly from the state officials.

The New York City Board of Health has served notice that stables on farms shipping milk to New York City must have concrete floors from sill to sill by November 1. This is not a new ruling. It has been a requirement of the New York City Department of Health for some time, but apparently has not been fully enforced.

The ruling, of course, affects only dairies shipping milk to New York City.

We would be glad to have any information concerning the whereabouts of Mr. C. B. Walters. He was living in Coatesville, Md.

When an agent or stranger calls and by his actions arouses your suspicions, jot down the license number of his car. If he is "on the square" it will do no harm and if not the information may be valuable.

NORTHERN NEW YORK School Teacher KILLED IN THIS CAR.

MISS EDNA M. CHITTENDEN was killed instantly when the car in which she was riding ran into fog, left the road and sheared off a six-inch elm tree before hitting another. For the past three years she had been teaching grade school in Hopkinton, N. Y.

Remember last winter? Enjoy Happy Heating next winter **ACT NOW!**

AN ALLOWANCE OF \$25 and up ON YOUR OLD HEATER OR STOVE

For one month only, an allowance of \$25.00 and up on your old heater and stove, no matter what its condition. This offer is made to get thrifty people to take care of their winter heating requirements right now, before the fall rush starts. UTICA HEATING SYSTEMS are economical, both in first cost and in the amount of fuel they use. They will assure you complete heating equipment and you can install one right now, for as little as \$10.00 a month, and as long as 3 years to pay. Don't neglect this opportunity to secure happy heating on easy terms and at comparatively small cost. Send the attached coupon today.

STEAM or HOT WATER BURN COAL, OIL or WOOD

NO DOWN PAYMENT—FIRST PAYMENT IN NOVEMBER

You can secure any type of UTICA HEATING SYSTEM you desire... steam, hot water or vapor... to burn coal, oil or wood. UTICA HEATING SYSTEMS are noted for their scientific design, economy of operation and lasting quality. With a UTICA HEATING SYSTEM, you can be sure of a comfortably heated home for many years to come. Our dealers can change over your present heating plant without fuss or bother and while prices are right and mechanics available. Install a UTICA HEATING SYSTEM now while labor and materials are at their lowest.

AUTHORIZED DEALERS EVERYWHERE

UTICA dealers are skilled heating men and they will gladly make an analysis of your heating conditions to determine the best type of heating system for your particular home, without obligation to you. All UTICA HEATING EQUIPMENT is **BACKED BY A GUARANTEE BOND!** Don't miss this opportunity to investigate, without obligation, how reasonably you can install a fine new UTICA HEATING SYSTEM on easy terms.

AMERICAN AGRICULTURIST

FIVE YEARS FOR \$3.00 — THREE YEARS FOR \$1.00 — PUBLISHED EVERY OTHER WEEK

Above: Corn is hailed as "King of Crops" in the Midwest, but it is at least "Crown Prince" in the Northeast, furnishing succulent green feed in winter to thousands of dairy cattle. Grass silage has stolen some of the limelight as a succulent winter feed but corn will be grown as long as cows roam northeastern pastures. Development of new and better varieties of silage corn has made possible the growing of more tons per acre.

Right: Colorful clusters of grapes, ripening in the sun, add beauty to Northeast harvest time.

Below: Sweet corn, cooked within an hour after it is picked, is a dish fit for a king. A home garden without this delicacy is scarcely worthy of the name. Sweet corn is a standard and favorite crop for roadside stands, and thousands of acres of it are grown for commercial canning.

Above: Fields covered with shocks of golden grain make a picture to be appreciated by artist and farmer. Combines, now becoming common in the Northeast, remove a bit of romance from grain harvest, and also some of the backaches.

Right: About 1840 blight ruined the potato crop in Ireland and famine stalked the land. Research men found a way to control the disease and saved the potato crop for the world. Now, Northeast growers use certified seed, bred for high quality and yield, and carry out a thorough spray program. Millions of bushels of "spuds" are harvested every year in the Northeast.

It takes **ALL 4** ... *Hub, Spoke,*
Rim and Tire to make the wheel go round!

One of the strongest pieces of machinery known to man is the wheel. Because every part works together — supporting and being supported by every other part.

The anti-farm gang know this. They know that the present form of farmer organization in this milkshed is very similar to a wheel. The farmer cooperatives are the spokes, the main strength of the wheel; the bargaining agencies are the hub, the Federal and State marketing agreement laws are the rim, while the Federal and State marketing orders are the tire that binds the three into a workable unit. Together they make a perfect instrument that can roll over all opposition. Apart they fall into a useless heap, scattering their strength in a dozen different directions.

That's why the next attack of the anti-farm gang will be centered on parts, and not against the whole, of the present set-up. The chiseling dealers and their oily-tongued lawyers and hirelings don't dare to attack the wheel. They know it is too strong for them, that it will ride over them and crush them. So they will attempt to pick

flaws ... to saw out a spoke here, to cut out a part of the tire, or to knock the journal out of the hub — *anything to weaken the wheel.*

But we farmers know that a broken wheel is worthless. We know that if we want to keep rolling toward higher, dryer ground ... if we want to get on the main highway to A LIVING PRICE FOR MILK ... we have got to keep the wheel together.

So let's question everyone who comes to us and tells us that he wants to repair the wheel. The wheel is good. It will carry dairymen to higher prices. The prices farmers will receive during the next few months will prove that the wheel is good. Let us make the man who wants to change the wheel prove to us that the changes are good. And let us ask ourselves seriously: *Does the man who wants to change the wheel really want the wheel* — or is he trying to tear it apart so that it won't work?

Remember that the present wheel is rolling steadily along toward A LIVING PRICE FOR MILK. Let's keep it together at all costs.

POULTRY CONGRESS Rings the Bell!

*Acres of Exhibits, World's
Best Speakers, Thrill
750,000 Visitors*

By H. L. COSLINE

THE WORLD'S Poultry Congress was a tremendous success, in fact that statement is much too mild. The one comment I heard most often at Cleveland was, "I had no idea that the Congress would be so big." Over forty countries sent official delegates and many had exhibits. Commercial exhibits were outstanding and attendance exceeded the most optimistic estimates.

Perhaps you, as a poultryman, are saying that no doubt it was a great show, but after all it was just a show and why should the average poultryman get excited. *It was more than a show and is*

(Left to right): W. D. Termohlen, Professor James E. Rice and C. W. Warburton. Mr. Termohlen of the United States Department of Agriculture has given his time to the Congress in the capacity of Secretary General. Professor Rice is Chairman of the General Executive Board, and Mr. Warburton is Director of the U.S.D.A. Extension Service.

going to put dollars in your pocket. In the first place the poultry industry has served notice on this country that it has grown up. No longer are chickens satisfied with scraps from the table. Neither will the poultry industry be satisfied with scraps, be they legislative, regulatory or financial. In the past the poultry industry has been noted among farm enterprises for its lack of organization. It took organization to put the Poultry Congress across, and that organization did not fade out of the picture when the Congress was over. The organized Poultry Industry will not hesitate to ask its share of state and federal funds for research, adequate marketing information to guide poultrymen, and its rightful place in formulating the farm policies of this country.

The World's Poultry Congress was a nonprofit enterprise and it has been frequently stated that any profits resulting from it would be used for the good of the poultry industry. It has been generally understood that the proceeds will be used in a country wide program to increase the consumption of poultry products. A start was made right at the Congress where crowds continually flocked around the "Transparent Kitchen" in which all day long several cooks demonstrated and talked about the use of eggs in the menu. Above each kitchen was a mirror set at an angle so that spectators could see exactly what was being done.

On Tuesday, farm and poultry paper editors gave a luncheon for Professor

This is typical of the interested crowds that flocked around commercial exhibits. This one featured three transparent hens with lights which could be turned on to illuminate various internal organs. The first hen illustrated normal conditions. The second showed the appearance of various organs affected by different diseases. The third illustrated the location of various parasites that rob poultrymen of their profits.

Rice and the staff of men who laid the plans and carried out the details of this gigantic Congress. At the luncheon, announcement was made that enough funds had already been taken in to pay every bill. That is the financial side. On the same evening the New York delegates held an informal reception with about 300 present. In my opinion the happiest man there was Professor James Rice to whom, more than to any other one individual, goes the credit for the outstanding success of the Congress. I am sure that not one of the hundreds, yes thousands, who worked for the success of the event will feel slighted when I make that statement. A fitting climax to his endeavors was his election as President of the World's Poultry Science Association.

The best show on earth would be of little use without someone to see it, and in attendance the Congress was again a smashing success. The Cleveland papers on Tuesday stated that the attendance of 117,000 that day was greater than at the New York World's Fair. Those who in the beginning said that the show MIGHT draw an attendance of a half million began to talk enthusiastically of a probable 750,000. I asked several from New York for an estimate of the attendance from the Empire State. The guesses averaged 2,000, with at least an equal number of visitors from northeastern states. That is just a guess and it may be far too low.

It is safe to say that never before has such

an exhibit of poultry equipment and everything connected with poultry raising been gathered together in one place. Merely to walk by the hundreds of exhibits would consume the better part of half a day and when one began to study them it became necessary, unless one was there for the whole week, to pick and choose what to see and hear. Mammoth incubators were in actual operation. Poultry houses and brooder houses had been set up and it seemed that every poultry feed and poultry remedy company in the country had its exhibit. There is always something new at a poultry show. For example, one company showed a system whereby poultry litter could be removed from the house by vacuum!

I doubt if we always appreciate the research and investigation that commercial companies do. At the Congress it was all there, and after spending one full day looking over commercial exhibits I said to myself that the poultry industry has finally come of age. No longer is it a backyard sideline. From now on its true value is going to be recognized.

The comment of a casual acquaintance interested me. Said he, "Looking at it in a world wide sense, I doubt if any industry employs so many men. Every country has poultry and I can think of no other industry so widespread."

One mammoth building was given over to exhibits of nations and states, with the entire end of the building filled with the exhibit of the United States Department of Agriculture. No one exhibit of other countries stood out above all others, yet if I were forced to pick one, the Blue Ribbon would go to Canada.

Thirty states had exhibits. Under such circumstances it is easy to be partial but I felt that the exhibits of our northeastern states were considerably above the average. In this same hall were the boys and girls exhibits including Boy Scouts, Future Farmers and 4-H Clubs.

The New York (Turn to Page 17)

Of particular interest to consumers was the transparent kitchen. This is a view of one side showing a demonstration of the use of eggs in cooking. Directly over the demonstrator is a mirror set at an angle which allowed the audience to observe just what was going on at all times.

IMPORTANT!

Free Grass Seed for Drought Sufferers

Read This and Tell Your Neighbors About It

NORTHEASTERN farmers who lost this year's grass seeding because of drought may obtain free grass seed for reseeding under conditions explained below.

The bad drought of this summer resulted in a very short hay crop, in burned out pastures, and particularly bad was the failure of new seedings. The milk marketing organizations are trying to offset the short hay crop by obtaining a higher price for milk. Pastures will come back with rain, but where grass seed failed to come up, it is a total loss.

A farmer in Tompkins County, New York, said recently that this is the first season in his experience in 53 years of farming when his new seeding failed. A survey in Dutchess County, New York, showed that 60 farmers out of a total of 75 visited had lost their new seeding.

On July 28, Mr. E. A. Flansburgh, County Agent Leader of New York State, asked the A.A.A. for a survey in the eastern states to find what the drought damage on seeding really is.

On August 2, a meeting was held in Washington where an emergency program to meet the situation was requested of the A.A.A.

Cutting all red tape and acting almost immediately, the Department of Agriculture agreed to the program presented by the northeastern States, and a meeting was called in Syracuse on August 7 to explain the operation of the plan. The same emergency program is available in the drought sections of Pennsylvania, New Jersey, and Southern New England.

On August 7, 8 and 9, County Conservation Committees met to decide if they wished the plan to operate in their counties, and dealers and co-operatives were notified, by meetings or otherwise, of prices to be paid for seed to determine if they wished to be placed on the eligible list.

How the Plan Operates

1. In each participating county a farmer who has lost his seeding may obtain grass seed free of charge up to the value of one-half of his soil building allowance. The farmer may obtain free the following varieties—alsike, timothy, red top, alfalfa (hardy northern grown, supply limited). These are New York varieties. In New Jersey and other northeastern states, some other grass seed may be substituted. **This seed must be purchased before September 10 and sowed immediately without a nurse crop.**

2. This emergency grass reseeding program has nothing to do with the regular soil building program or allowances, and does not affect payments on the regular soil building program.

3. Retail seed dealers in participating counties may furnish some of the seed at prices set by the conservation authorities, and those prices will include a margin of profit for the dealers. Every seed dealer in participating counties will have an opportunity to know of the plan and to take part in it if he agrees to furnish seed which meets the specifications set up by the State Committee and the prices established by the Committee.

How the Farmer Can Get the Seed

1. If possible, attend the emergency meeting

called in your county to explain the plan.

2. Contact your County Agent or some member of the County Conservation Committee.

3. Ask that your seedings be checked to determine your situation.

4. Any farmer, whether he is in the 1939 Agricultural Conservation Program or not, who has lost a 1939 seeding will be eligible to obtain seed from any one of the approved dealers up to an amount equal to one-half of the largest possible soil building payment for his farm.

5. Any person authorized by the County Committee to accept requests for seed shall be furnished with a list of the approved dealers in the county and shall fill out a form or blank giving the name of the approved dealer from whom the farmer wishes to obtain the seed, the kind and amount of seed needed, the price per pound, the number of acres to be seeded and other information. When complete, the farmer must sign this application.

How to Sell More Apples

REPORTS indicate that the Northeast will harvest this fall one of the best crops of high-quality apples in many years. The severe winter of 1933-34 killed many apple trees, but since that time there has been a rapid increase in the productivity of young trees of new and better varieties.

The Northeast has always grown a quality apple, but until recently the Northwest has done a better job of marketing their apples, even though they are of poorer quality, than have the fruit growers of this section. However, we are making some progress. That old awkward package—the barrel—has rapidly been replaced by attractive, handy small packages, and infinitely better grading and classification of apples is now being done, with the result that consumers are beginning to recognize how good our northeastern apples are.

Even with selling we are doing a better job. Our New Jersey Editor, Amos Kirby, reported recently in our New Jersey edition the successful campaign to increase the consumption of eastern apples carried on by the New Jersey Apple Advertising Committee in cooperation with Appalachian Apples, Inc., and the New York-New England Apple Institute. A test campaign was conducted in New Jersey's millionaire town of Montclair. In this campaign, in which 122 stores including both chains and independents joined, sales jumped from 2.7 bushels per store to 7.6 bushels per store the week following, and in the third week sales in every store were 192 per cent above sales before the campaign started. The stores in this one town sold a total of 330 bushels of apples a week before the campaign. During the week the campaign was in progress, sales jumped to 931 bushels.

I made a nuisance of myself several years ago in *American Agriculturist* by stating that the barrel for eastern apples must go. It has largely gone—at least for our better quality apples. Now I am going to keep hammering the idea that the next step is to get back of organizations like the New Jersey Apple Advertising Committee and the New York-New England Apple Institute with money enough from every grower to give eastern apples their place in the sun that their fine quality deserves.

Lincoln Wisdom

"The strongest bond of human sympathy, outside of the family relation, should be one uniting all

working people of all nations, tongues, and kindreds. Nor should this lead to a war upon property, or the owners of property. Property is the fruit of labor; property is desirable, it is a positive good in the world. That some should be rich, shows that others may become rich, and hence is just encouragement to independence and enterprise. Let not him who is houseless pull down the house of another, but let him labor diligently and build one for himself, thus by example assuring that his own shall be safe from violence when built."

—Abraham Lincoln.

ICOMMEND those words of the great Lincoln to everyone who would destroy or pull down other men's houses or plans because he, the critic, had no part in building or making them.

A Good Time to Buy a Farm

THIS is the best time in years to buy a farm. "What", you say, "buy a farm when agriculture is as flat as it is at present?" Yes, sir, just that!

Because agriculture is passing through hard times, good farms can be bought for far less than the cost of the buildings. When a living cannot be made on such farms, why, then, America has no future whatever.

But there is a future for America and for agriculture. There is nothing so sure as change. Farming is a long-time business. If you have farmed for a long time, look back across forty years of active life and see the many ups and downs through which you and your business have passed. The trouble is that we always judge the future by the present. If times are bad, we conclude they always will be; if good, we act as if there never would be any change for the worse, and so make all kinds of mistakes.

Of course it is not the time to buy just any farm. It has got to be good land, well located, with buildings that are not so good that they are over-capitalized, nor so poor that it will cost too much to put them in shape.

Horace Greeley once told young men to go West, I say to young men that the Northeast is a good place to farm; now is a good time to get started; and you can do so with the assurance that the prospects for a young man properly trained, properly located, and with a love of farm life, are as good as they ever were.

Eastman's Chestnut

IDEDICATE the following to Dr. Bill Myers, former Governor of the Farm Credit Administration, now head of the Department of Farm Management at Cornell University. Among his other qualifications, Bill is the best smoke ring blower I know. Fact is, he could have given old Grandpap a run for his money!

Here's the whopper claimed to be the personal experience of the friend who told it to me:

"It was when I was a little boy visiting my Grandpap in the mountains. We was sitting there on the steps, and Grandpap was puffing away on the corn cob pipe and telling me of the things he's seen in his time. I crawled down into the yard to get a stick to whittle on, when out of the brush came a big grizzly bear. He grabbed me and knocked me down. I thought my time had come, when Grandpap just takes a big puff of smoke and blows a ring so big it could have busted his cheeks if he hadn't been an expert. It settled down on that bear's nose and jammed his jaws so tight together that he couldn't take a bite of me. While he was trying to claw it off, Grandpap just blew one after another and bound that bear up so tight he died of strangulation!"

DAIRYMEN *Must Have* HIGHER MILK PRICES

FACED with the shortest hay crop in years and with burnt out pastures, resulting in a great decrease in the production of milk, dairymen and their organizations are demanding an increased price for milk in line with their higher costs.

On July 26, Fred H. Sexauer, president of the Dairymen's League Cooperative Association, telegraphed the Metropolitan Cooperative Milk Producers' Bargaining Agency, at Syracuse, setting forth dairymen's losses from drought and urging that the Bargaining Agency appeal to the Secretary of Agriculture and to the New York State Commissioner of Agriculture and Markets for an immediate hearing to amend the Federal and State marketing orders, so that the price paid to the farmers for milk should be increased during this emergency period.

Acting on this suggestion and others received from other cooperatives, the Metropolitan Milk Producers' Bargaining Agency immediately got busy. Fifty milk marketing cooperatives were represented at a delegate meeting of the Bargaining Agency held at the Onondaga Hotel, in Syracuse, on August 3rd. Also attending the meeting were representatives from the New York State Department of Agriculture and Markets and from the office of the Federal Milk Marketing Administrator.

Previous to the meeting of the delegates, the Board of Directors had met with the Distributors' Bargaining Agency in an attempt to get an agreement between producers and distributors on price increases. It was felt that quicker action could be obtained in amending the orders if the dealers would agree not to fight the proposed amendment in the hearings. At this meeting a class I price of \$2.82 was agreed upon by the Board of Directors of the Bargaining Agency. However, no agreement could be reached with the dealers on this price.

Realizing the necessity of fast action in order to bring immediate price increases to producers, the Board of Directors reported to the delegate meeting the results of the meeting with the distributors with the suggestion that a compromise be worked out that would result in higher prices to producers, beginning September 1st.

After a very thorough discussion of conditions affecting production throughout the milk shed, and a discussion of price changes, the delegates authorized the Board of Directors to petition the Secretary of Agriculture at Washington and

Commissioner Noyes to call hearings on an amendment to the orders.

Two proposals were made. The first would seek to add 7½ cents to the average butter price in determining the class I, 2A, 2B and 3B prices in accordance with the existing schedule in the orders. Under present conditions this would set the class I price for September at \$2.65 and would add 40 cents to the class 2A and 30 cents

to petition the State and Federal governments on the proposal that would bring the best and quickest returns to producers.

Representatives of the Federated Milk Producers' Cooperative Bargaining Agency indicated they would support the proposed amendment. Furthermore that an attempt would be made to put the program into effect on a voluntary basis by August 10th. In view of past experience with New York dealers, little hope was expressed that a voluntary program could become effective.

Mr. Ernest Sheldon of Little Falls offered a resolution stating that the policy and program of the Bargaining Agency would be to work with all producer controlled groups, regardless of size, in developing greater unity and strength among all producers in the Metropolitan Milk Shed. This was adopted unanimously.

Acting Governor Charles Poletti, at the request of the State Commissioner of Agriculture, Holton V. Noyes, made a direct appeal to the President of the United States for aid to both dairy and poultry industries "because of the disastrous effects of the drought upon our state's agriculture."

In New York City, William J. McKay, chairman of the dealer organization known as the Metropolitan Distributors' Bargaining Agency, said that his group was willing to expedite hearings to determine a fair price, but said dealers would oppose the \$2.65 demand as unwarranted. He said an increase from the present rate of \$2.25 to \$2.65 would necessitate boosting consumer price in New York City one cent a quart for grades A and B milk. (The constant harping by dealers and others on the consumer's price always raises my personal indignation. When there is a shortage of any other product, the price always goes up without question. Why should it not go up for milk when necessary? Milk at any reasonable retail price is the cheapest food on the market.—E. R. E.)

In New Jersey, a public hearing to discuss the future price of milk was held on August 8 by the New Jersey Board of Milk Control. New Jersey dairymen, representing all of the producing areas in the state, registered a strong plea for a higher price on milk, blaming the drought for the big increase in cost of production.

One of the encouraging features of the present milk situation is the fine way in which almost all of the milk marketing organizations, both in and out of the Metropolitan (Turn to Page 11)

Milk Price Amendment Hearing August 24

JUST as we go to press, announcement is made that a hearing to consider an amendment on price changes in the Federal-State Milk Marketing Order will be held August 24 at ten A. M. Daylight Saving time in the Lincoln Auditorium in Syracuse. Commissioner H. V. Noyes announced the hearing and a similar announcement is expected from Secretary Wallace. The request for the hearing made by the Producers' Bargaining Agency specifies that a price amendment only is to be considered. This was done in the interest of speed and it is understood that later hearings will consider other suggested amendments.

The Bargaining Agency petitioned for a Class 1 price of \$2.82 per hundred. That is not necessarily the increase that will be submitted to the producers for a vote, assuming that an amendment is the outcome of the hearing. Some doubt is being expressed over the possibility of putting a price increase into effect by September 1. Care is being taken to follow the exact procedure called for in the Order to avoid the possibilities of Court action to upset the amendment if adopted. However, no red tape should be allowed to interfere with a higher price for milk at the earliest possible moment.

A second hearing to allow dealers to present their case will be held in New York City August 25.

to the class 2B and 3B prices. The second proposal would seek to establish a minimum class I price of \$2.82. It was left to the discretion of the Board of Directors to study both proposals and

MILK *is the only material in nature designed solely to serve as food, and regularly used in liberal quantities, is the best possible foundation of the diet.*—Mary Swartz Rose, in "Foundations of Nutrition."

MILK FURNISHES MORE OF THE ESSENTIALS OF THE DAY'S DIET THAN ANY OTHER FOOD. . . . COMPARED WITH OTHER FOODS, MILK IS CHEAP AT ANY PRICE UNDER 20 CENTS A QUART.

The shaded portion on the chart indicates that part of the adult's daily dietary needs furnished by one quart of milk. Wavy lines indicate variable amounts.

Chart by courtesy of Professor J. H. Frandsen, Department of Dairy Industry, Massachusetts College of Agriculture. Professor Frandsen is doing a fine educational job on the food value of milk and other dairy products.

What Price Apples?

By ED. W. MITCHELL

Ed. W. Mitchell

AFTER A HOT, painful day thinning off perfectly good apples that I would like to put on trees that have none, and fighting deer flies that seem determined to reduce my over-weight, I sat down to meditate on the many miseries of this life and study A E 263 and 276.

These are studies of apple prices made by Harper, DeGraff and others of the Cornell Agricultural Economics staff, and may be secured by anyone who takes the trouble to ask for them.

I have a great respect for the work

of that department because it is based on facts and figures rather than on theories and opinions. Apple growers, I notice, are apt to be prejudiced in favor of apples, and their opinions are apt to be distorted by prejudice and hopes.

DeGraff calls attention to the fact that apple prices have varied from \$1.95 to 51c for a packed bushel ready to leave the farm in Niagara County in the last 20 years, and have dropped from an average of \$1.15 in the 1920's to 70c in the 1930's.

A drop of 40% is too much for us to absorb by reductions in costs of production. I admit that apple growers are extravagant and visionary, but too many of our costs are fixed and unavoidable to allow for any material saving in production costs. Increased yields are the answer to that, and we

must find some other answer to that 40% reduction in price.

Harper in his study of Ulster County sales of the 1937 crop, which averaged 53c a bu. for the fruit, points out some of the causes for the difference in price between different lots of fruit. Knowing the cause is the first step in finding a remedy.

In general, the dessert varieties, Mac, Delicious and Spy, sold for 40c more than the others which I suppose are all classed as cooking apples by the trade. No. 1 grade sold for 40c more than the lower grades, and the desirable sizes sold for 40c more than the smaller ones. The premium for Fancy over No. 1 was only 15c, but the penalty for grades lower than No. 1 was 40c. A premium for large size was apparently paid only for large baking apples, Spy, Cortland, Greening and Rome. Cold storage did not pay that year because the price trend was down. What the price might have been if we had not stored over half of the crop is anybody's guess. I don't even like to think about it.

DeGraff's study of Niagara County prices shows two major factors in making apple prices: the General Price level and N. Y. Factory Pay Rolls, and the size of the apple crop in the 3 area section, New York, Shenandoah and the Central West. The crop in New England and the Far West, and the crop of oranges and competing fruits apparently have little effect on Western New York apple prices. If a person wants apple pie or apple sauce, she does not buy an orange to make it, even if oranges are cheap.

DeGraff gives some interesting tables that anyone can use to estimate the price he should get this year and the value of his crop. Increased harvesting and package costs cut heavily into profits when a large crop sells at low prices. They are not so painful when you have a large crop and prices are good.

The first table shows that when this 3 area crop was 25% below normal, the farm price of apples was 23% above normal. When the crop was 25% above normal, the price was 15% below normal.

The gross value of the crops varied less than the price might indicate—92 for the small crops and 106 for the big ones.

The next table gives apple production and price in per cent of normal, and the price in money you may reasonably expect at various levels of the New York Factory Payrolls Index. We will get pretty accurate crop estimates by the first of August and surely by September, and the NYFPI is published monthly. Every apple grower should get a copy of A E 263 and 276, look on page 13 and regulate the grade he packs and the price he asks, using those data as a guide.

If there is over-production of apples, we, the apple growers, are responsible for it. If that over-production is to be corrected, we are the only ones who can correct it. A paternalistic government and a competent staff of public servants are giving us all the information we need, but they can not give us the will to act intelligently. I hope we can bring ourselves to do so before we have to resort to dictatorship and control by laws and regulations.

Production control can be accomplished by the growers at little if any cost, and probably they will get well paid for it. Just figure packing, package, transportation and selling costs; add these to the price for cider apples; then throw out varieties and grades that do not show a profit on that basis. We at least break even on that deal, and it will show some profit because it will help the price for the apples that do go to market.

That brings up another point that appears in Harper's study, and one that I can hardly believe. About half

SAVE TIME in the CORN HARVEST

Use
McCORMICK-DEERING

- CORN BINDERS
- ENSILAGE CUTTERS
- ENSILAGE HARVESTERS

McCormick-Deering Power-Drive Corn Binders, 1- and 2-row sizes, have stepped up the corn harvest to the pace of modern tractor speeds

- Good equipment pays dividends at silo-filling time when every day counts. Check over your corn binder and silage cutter now. Make necessary repairs. If you need new machines, see the McCormick-Deering dealer.

In addition to the famous McCormick-Deering Corn Binder for horse use, he has the modern 1 and 2-row Power-Drive Binders, which are operated through the power take-off of the tractor.

He also has a full line of McCormick-Deering Ensilage Cutters, ranging in capacity from 8 to 20 tons an hour. Included in the line this year is the new No. 12-E.

If you want to make silage by the "combine" method, the McCormick-Deering Ensilage Harvester is available. It cuts the stalks, reduces them to silage, and delivers the silage to a truck or wagon, all in one field operation.

Buy McCormick-Deering—the line with the reputation for quality; low-cost, dependable performance; and long life.

INTERNATIONAL HARVESTER COMPANY
 (INCORPORATED)
 180 North Michigan Avenue Chicago, Illinois

The new McCormick-Deering No. 12-E Ensilage Cutter, with its capacity of 12 to 20 tons an hour, has many features that provide unusual efficiency.

BELOW: The new McCormick-Deering No. 10-E Ensilage Cutter, capacity 8 to 12 tons an hour.

BELOW: A fast, economical way to make silage—"combining" it in the field with the McCormick-Deering Ensilage Harvester.

McCORMICK-DEERING

STAKE YOUR CLAIM!

New Field of Poultry Profits is Open to You!

HERE'S your chance to get in on the ground floor of a new field of poultry profits—the quality egg field.

More and more housewives, chefs, and other consumers are learning about the "Difference Purina Layena Makes!" Strong shells... uniform colored yolks... uniformly high vitamin A and G content—all these sales points will help you sell Layena eggs.

In addition, your Purina dealer will furnish you free of charge a supply of egg cartons with every bag of Layena... a rubber stamp bearing your name so that you can personalize each car-

ton... the attractive fiber road sign... and other sales helps at actual cost.

On every Layena carton is printed a money-back guarantee, assuring the customer that Layena eggs are uniform in yolk color and of the highest quality in every respect. This guarantee is backed by Purina Mills. It gives you an added selling point on your eggs that will help you get top prices for them.

Stop in and see your Purina dealer. Let him tell you more about the Layena Egg Producing and Selling Plan!

ESCAPE FROM ALBANIA— PART II—ZOG I, KING

SINCE war seemed imminent, we hurried through Yugoslavia to reach our objective, Albania. Alarming rumors came over the radio and by that underground telegraph which always senses danger. Arriving in Tirana, the capital of Albania, we had tea with our United States Minister, Hugh G. Grant, and his delightful and most efficient wife. The situation became more tense. Italy was making many demands on King Zog which he refused to grant. Mussolini became more insistent and threatening.

Tuesday night we stayed with Mr. and Mrs. Merrill Knapp. Merrill had been one of our Danforth Fellowship boys from Cornell University in 1935. After graduation he joined the Near East Foundation and for two years has spent his energy in directing agricultural work in Albania. The next morning we were awakened at daybreak by the booming of guns. We thought Italy had begun its attack on Albania. A few minutes later, however, more than 100 boys from the American Agricultural School marched by our windows shouting that an heir to the throne had been born—Prince Skender II, named for Albania's 15th Century hero.

Even with the happiness of having a male heir to the throne, there was uneasiness everywhere. Italy asked an immediate Yes or No to her demands, Parliament had been called for the following day. In Tirana we were invited to a distinguished dinner party given by our American Minister and his wife in honor of the Queen's mother and the new Rumanian Minister. There we met many of the diplomatic colony and I had frank discussions with these foreigners which convinced me more than ever that trouble was imminent.

Thursday morning dawned. The government had during the night issued orders commandeering all cars and gasoline. Here we were in Albania's capital "high and dry". Minister Grant was most considerate and in touch by cable, in secret code, with Washington. Italy ordered her subjects—men, women, and children, except the necessary officials at her Embassy—to the coast to be transported across the Adriatic by warships to Italy. King Zog ordered all gasoline supplies to be removed to the interior. There was confusion everywhere. The city's square was filling with angry mobs led by speakers who mounted steps and shouted that every Albanian would stand by his King to a man.

Our Stars and Stripes floated over the American Legation and we were told to stay close by. At two o'clock Mrs. Grant hurried to us, saying that King Zog had provided two cars to take the Queen's mother and her Aunt across the border to Yugoslavia, and we could squeeze in if we hurried. With quick goodbyes we sped away—and did that chauffeur step on the gas!

Although we bumped breathlessly over the rough Albanian roads, we couldn't make the border by nightfall. We slept restlessly in Scutari near the border.

"Pronto—pronto", cried our chauffeur just before daybreak the next morning. We dressed and hurried to the border. After much parleying with Yugoslav officials over passports we were allowed to cross into safety after the magic word "Diplomatic."

During that last restless night in Albania, Italian battleships began shelling the coast towns and at dawn landed soldiers. The King spoke from his palace in Tirana, saying he had come from the mountains in rawhide shoes, and would return the same way if necessary. He was in deep distress over his Queen and day-old baby.

"I lose no matter what happens!" King Zog told one of my friends as he paced the floor confronted by the hopelessness of his situation. If he stood his ground, his inadequate army would have been slaughtered by superior forces. If he followed his own desires he would retreat to the mountains but that would endanger the life of his devoted wife and newborn son. Only one choice seemed left—to cross the border into Greece with a hope that the future would permit him to return and lead his people again.

"See You at the STATE FAIR"

FOR 15 DAYS at Syracuse, from August 26 to September 9, the State Fair Management has planned a program that has seldom been equalled. In addition to an opportunity to see some of the finest stock, crops, fruit and vegetables in the world, this event gives an opportunity to renew old friendships. The staff of *American Agriculturist* hopes to meet you there. For your information here is a condensed program of some of important events day by day:

FIRST WEEK

SATURDAY, Aug. 26,

"American Legion Day"

Grand Opening—Speeches by Commissioner H. V. Noyes and Mayor Marvin of Syracuse.

American Legion Parade—Drum Corps competition.

Aviation Round-Up—A concentration of privately owned planes.

Motorcycle Championship Race—First officially sanctioned 50-mile National Championship Motorcycle Race.

Dance Contest—Finals of the State Championship Dancing Contest, conducted by Arthur Murray.

Rodeo and Fireworks—Magnificent display of fireworks and an evening packed with Wild West thrills.

SUNDAY, August 27, "Religious Day"

Religious Services—Conducted in the Coliseum by Rev. S. Burman Long.

2,000 Voiced Chorus—Chosen from more than 200 Central New York choirs.

Interdenominational Services—Religious services representing four faiths.

Homer Rodeheaver—Community singing under the leadership of the world famous director.

Twilight Service—Singing of favorite hymns, old and new, in the Grandstand led by Homer Rodeheaver.

Elijah—Mendelssohn's lovely oratoria, presented with a chorus of 125 voices and featuring the voice of Mark Love, Opera star. In the evening.

MONDAY, August 28, "Fair Queen Day"

Coronation—of the State Fair Queen in front of Grandstand.

Official Opening—of Agricultural Division of the Fair. Judging opens for Draft horses, cattle, sheep.

Opening—of Grand Circuit Meet. Year's most spectacular display of pacers and trotters.

Opening—of the Sportsmen's Show in the Machinery Building. A new feature of the Fair.

Spelling Bee—Semi-finals in State Championship.

Opening—of the 4-H Exhibits.

TUESDAY, August 29

"Farm and Home Bureau Day"

Empire State Gladiola Show—In the Horticultural Building.

Spelling Bee—State Championship for Boys and Girls.

Dairy Cattle Exhibit—Prize winning entrants in a huge cattle exposition.

Sportsmen's Show—Special exhibition of experts in casting, log chopping, log rolling.

Horseshoe Pitching Contest—First day of the State Championship.

Aviation Show—Exhibit of modern aircraft. A FREE show in Empire Court.

Rodeo—Outstanding bronc riders, ropers and bulldoggers in an amazing demonstration of skill and daring.

WEDNESDAY, August 30, "Grange Day"

Grand Circuit Races—Featuring the famous Noyes Stake, \$10,000 purse.

Farm Bureau Exhibit—Prize exhibits of farm products—Supervised by Grange Officials.

Conservation Exhibit—Model woodlands exhibition—featuring real woods, 600 ft. trout stream and live animals.

Singing Contest—Prize winning Grange choruses in competition.

Flower Show—A new flower show more beautiful than ever in the Horticultural Building.

Style Show—Lovely models picked from the 4-H Clubs wearing the smartest fashions as well as a feature display of homemade clothing.

Livestock Judging—Draft horses, dairy cattle, sheep, goats, swine, and poultry.

THURSDAY, Aug. 31, "Governor's Day"

Governor's Speech—In front of Grandstand during the afternoon program.

Indian Village—Special ceremonial welcome for the Governor in the Indian Village.

Grand Circuit—Racing for the classic Governor's Stake, \$10,000 purse.

Homespun Acts—A program of old time Fair features—yodeling, whistling, hog-calling, greased pig chases. Fun of Fairs gone by.

FRIDAY, September 1, "Women's Day"

Women's Day Luncheon—All Women's organizations and clubs represented at luncheon in the Harriet May Mills Building.

Baby Show—To select the healthiest baby from New York State's best. Final selection Sunday.

Famous Women Speakers—Three women, famous for achievements in politics, aviation and business will speak.

Band Competition—High School bands of state competing for honors.

Livestock Parade—Parade of prize winning livestock.

State Fair Flower Show—Horticultural Building—a specially arranged display for Women's Day.

World's Fair Review—in coliseum—a sparkling musical review.

SECOND WEEK

SATURDAY, September 2

"Automobile Race Day"

Time Trials—for the qualifying round in the day's Automobile Classic.

Jalopy Race—Automotive antiques—25 years old and more, racing for speed honors. A thrill-packed race.

100-Mile Race—National 100-Mile Dirt Track Championship. Nationally famous automobile racers competing for dirt track honors.

Gala Final Show—Concluding performance of George Hamid's masterpiece, WORLD'S FAIR REVUE in Coliseum.

SUNDAY, September 3, "Baby Day"

Baby Contest—Healthiest and most beautiful baby selected from sectional prize winners from the state.

Model Clinic—A display of modern equipment for the care of infants—supervised by famous baby specialists.

Aviation Show—One million dollars worth of airplanes and aircraft accessories. A FREE show in Empire Court.

MONDAY, September 4, "Labor Day"

Running Races—Opening of an exciting six day meet—six races daily.

Homespun Features—Yodeling, whistling, hog-calling, greased pig chases and other high-lights of Fairs gone by.

Fruit and Farm Produce Exhibit—A major display in Horticultural Building.

"Lucky" Teter—A daring exhibition of driving. One of the spectacular features of the Fair, in front of the Grandstand.

Famous Dance Band—A nationally known Dance Band playing for dancing in the afternoon and evening.

TUESDAY, September 5

Sportsmen's Show—A full day program of water stunts on the lake in Machinery Building Court. Also casting, skeet shooting and log chopping.

Running Horse Races—Second day of running horse races—six races.

Steeple-Chase—The best jockeys of Canada and the United States in spectacular races on the new steeple-chase course in the infield.

Radio Revelry—Famous stars of national networks appearing in new floor show.

Fireworks—Huge aerial fireworks display in front of Grandstand.

WEDNESDAY, Sept. 6, "Aviation Day"

Feature Speaker—A nationally famous representative of the aircraft industry.

Manufacturers Exhibition—Exhibition of planes representing the finest developments in aircraft manufacturing.

Formation Flight—A powerful demonstration of flying skill.

(Continued on Page 14)

PAPEC CUTS Silo Filling COSTS

Why do more farmers buy PAPEC Cutters than any other make? It's because Papec offers the *most cutter for the money!* You get a bigger, sturdier, easier-running machine that is guaranteed to *do more*—and you get it for \$25 to \$75 less money.

**MORE TONS
PER HOUR**

The non-clog Papec with its improved self-feeder cuts silo filling costs to the bone. It also makes hay silage, chops hay into barn or stack, stores straw direct from the thresher or after combining, shreds fodder and even elevates feed grains. With a Papec

**ON LESS
POWER**

you are equipped to handle *all* your feed and bedding at a big saving in time, labor and space.

Papec knives and other parts cost less and are quickly obtainable for any model no matter how old or where located. See your dealer or send postal for free booklet, "More Profit Per Acre." Gives valuable information on

**WITHOUT
CLOGGING**

making and feeding hay silage, stacking chopped hay, filling trench and upright silos, handling straw. 74 pictures. No obligation. Papec Machine Co., 398 E. Main St., Shortsville, N. Y.

**MORE IN USE THAN
ANY OTHER MAKE**

PERMANENT PROFITS

Extra Savings

The Grange Silo at its present low price and with its long term of excellent service ahead, is bound to return you profits. Grange saves space and feed, cuts down feed costs, increases milk production, and saves time and labor. In addition, since we are not exhibiting at the Fair this year, we offer instead a *special concession* on every silo sold as a result of this ad. We share with you the saving in exhibition cost. Write for details now, but BE SURE to mention this ad.

CHARLES M. GARDNER

Editor of the National Grange
Monthly and High Priest of De-
meter of the National Grange.

NO BETTER GLIMPSE of the practical nature of Grange objectives can be found than in the important part the organization is taking toward promoting safety on the highways. For years an educational program of highway safety has been carried out among the Granges of the country and for an equal period liberal cash prizes, medals, etc., have been awarded to Grange young people for their best essays in directions of highway safety.

A new departure in Grange endeavor is the offer of \$300 in cash prizes to be distributed to local Grange units for the most practical safety programs carried out during the year, as well as definite local projects to make the roads safer, eliminate danger spots and promote general safety education. In the present year's contest for these prizes entries have already been received from 27 different states and are steadily coming in. In this commendable work the National Grange takes the lead and cooperates with the National Safety Council and the Automotive Safety Foundation. National Lecturer James C. Farmer of Keene, New Hampshire, heads up this work, and the winning Granges in the competition will be announced at the National Grange session in Peoria, Illinois, next November.

* * *

NEW JERSEY'S newest Grange hall, located in Hunterdon County, is the proud possession of Sidney Progressive subordinate, and represents an outlay of about \$6500, which also includes a great amount of volunteer labor by the membership. This New Jersey Grange was instituted early in 1930 with 34 charter members, but has more than 200 Patrons on its roll at present.

* * *

THE EXTENT to which the Revolving Scholarship Fund, operated by the New York State Grange, is functioning, is evidenced by the fact that more than 90 applications for loans have already been filed by Grange young people in the Empire State, who desire to continue their education this fall beyond graduation from the public high schools.

* * *

ONE OF THE oldest Granges in Delaware has just celebrated its 65th anniversary, Centre, No. 11, located near the city of Wilmington. This subordinate was instituted six months before

there was any Delaware state organization and was put under the jurisdiction of the Maryland State Grange. Centre Grange has been continuous in membership and prosperity and contributes decidedly to the civic welfare of its vicinity.

* * *

THE YOUNGEST Pomona Grange in New Hampshire has just celebrated its 30th anniversary, Union, No. 20, which is located in the central part of the state. The anniversary program featured addresses by State Master William J. Neal and State Chaplain Rev. Austin H. Reed.

* * *

APPARENTLY THERE is to be another new Grange hall in Connecticut before very long, as New Canaan

Grange in the southwestern corner of the state has purchased a plot of ground and money-raising projects are well under way to provide the necessary finances for a home.

* * *

THE MASSACHUSETTS State Grange each year awards three scholarships of \$150 each to deserving young people, covering three different sections of the state, and these awards have just gone to Robert H. Midgley of Westboro, Richard H. Jacquith of Northampton and Miss Marilyn E. Carpenter of Gardner. The three young people have all been very active in Grange circles, each one is a 1939 officer, one a present master and one a

past Juvenile master. These scholarships supplement the regular work of the Grange Educational Aid Fund in Massachusetts, which has aided nearly 2,000 young people to secure a better education than the public schools afford.

* * *

NORTH HAVEN GRANGE in Connecticut, just outside the city of New Haven, carried out an impressive community event in the form of a combined Flag Day and Americanization program, held on the village green in the center of the town. The American Legion, Legion Auxiliary and other patriotic organizations were special guests and the attendance was very large.

HEIGH-HO ★ FUN AT THE FAIR

NEW YORK STATE FAIR

SYRACUSE, N.Y. ★ AUG. 26 - SEP. 9

★ HARNESS HORSE MEET—Top-flight pacers and trotters racing in the famous Grand Circuit.

TREAT YOURSELF To a Trip to the Fair

Come to the greater 1939 State Fair prepared to see and hear the dramatic spectacle of "Elijah" sung by a chorus of 125 voices . . . stars of the radio network in their own show . . . three nationally famous dance bands . . . Homer Rodeheaver lead the community singing. Come and enjoy the daring driving of "Lucky" Teter and his Hell Drivers . . . the Wild West Rodeo . . . the million dollar Aviation Show . . . the Steeple-Chase races on the new course . . . Running Races . . . the trotters and pacers in the Grand Circuit races . . . the thrilling 100 Mile Dirt Track Automobile Race. Come and see the judging in Dairy Cattle—Draft Horses—Sheep and Poultry. Plan to enjoy every one of the 15 thrill-packed days—this is the year to "HAVE FUN AT THE FAIR."

FIFTEEN THRILL-PACKED DAYS

NEW YORK STATE FAIR
SYRACUSE, N. Y. ★ AUGUST 26 - SEPT. 9

★ PRIZE DRAFT HORSE—A champion from the 1938 State Fair.

★ PRIZE LIVESTOCK EXHIBITION—See prize entrants in cattle, horses, swine and sheep.

"Miss Jones, I'll have you know I'm no share cropper."

By L. B. SKEFFINGTON

From SKEFF'S NOTEBOOK

Mercker Summarizes Potato Situation at Growers' Field Day

"THE greatest meeting of farmers that will be held this year," said Dean Carl E. Ladd—and it was. Total attendance of more than 12,000 was the estimate of President Roy A. Porter of the Empire State Potato Club, surveying the annual field at the Gardner farms at Tully.

The big crowd heard a message of optimism for potato growers. "Al" E. Mercker of the USDA came to the meeting just after completing a survey of principal potato-producing areas. He voiced his expectation that potato prices will be higher than a year ago.

His words came at a time when many growers have been seeing the market going down. Mercker pointed out that over a period of several years the market lows have been reached in August.

To those who wanted some "inside dope" on the price outlook Mercker had it. Reviewing growing conditions, he said adverse weather had affected the outlook in a number of states. The total estimated production in 13 late states is placed at one per cent more than a year ago, but in several states the potential yield has been going down sharply with the drouth. Eastern Pennsylvania and Long Island have smaller crops. Growing conditions in New York have been better than in a number of states, and very much better in New England.

To Sell or Hold?

Mercker said that an average of four years showed potato prices up 104 per cent from the lows of August. Because of this, he said, "it has paid growers to wait for the low-price period to pass."

Another factor which he thought would help the market was that there would be more demand this year due to improved business conditions. As to the size of the crop and its quality, Mercker said would depend very largely upon weather conditions during the next few weeks.

Seriousness of the drouth in the farm crop outlook was emphasized by Dean Ladd. Practically all sections of the state have suffered, with dairymen being hit hardest because of short hay and grain crops and pastures scorched under blazing sun. Rainfall in most sections this summer has been fractional of normal amounts.

One of the greatest losses to farmers has been in new seedlings, Dean Ladd said. He told of inspecting scores of fields seeded this year and not finding any growth. Surveying the damage to new seedlings in the state, he placed the loss at 50 per cent, pointing out that "this means clover will not be harvested from these fields next year."

Brewster Sends Speech

There was disappointment because Congressman Ralph O. Brewster, former governor of Maine, was not on hand to make the principal address. Brewster delayed leaving Washington, hoping to fly up in time, only to find that the vote on the housing bill was scheduled at the same time. Party leaders refused to allow legislators to "pair" their votes. As the newspapers later recorded, the House rejected the 800-million-dollar housing bill.

The farm program was termed "relief for foreign agriculture" by Brewster in the speech which he had prepared for the occasion, and which was read. He cited that after several years of farm programs wheat was selling at the lowest price on the Liverpool mar-

ket, corn at the lowest in Chicago and the market was glutted with American cotton. He said each succeeding program of the administration denounces the previous and then goes it one better. He said a year ago Secretary Wallace denounced export subsidies, and now under his new program "Japan will get about six million dollars of American money before the trade treaty expires in six months."

Tully in Gala Dress

The field day was staged on the farm of Walter and William Gardner, the former vice-president of the potato club. Dean Ladd characterized the farm as "one of the finest pieces of soil in New York; I doubt if one can find more productive acres anywhere in New York or in the world."

The Gardners farm 180 acres and plow under either Japanese millet or corn for green manure. They are among the oldest growers of certified seed in the state. During the day plowing and fitting demonstrations were conducted and visitors had opportunity to note how the rich, dark soil showed considerable moisture in spite of the generally dry weather.

During most of the day the sun was hot and a strong wind blew. Just

as Dean Ladd was concluding his remarks the wind heightened, blowing over a few tents, and rain swept the scene. There was quick scurrying for cover. More than one farmer caught in the rain and drenched was heard to remark that it was much better than drouth.

Don D. Ward, manager of the Onondaga County Farm Bureau, was general chairman for the field day.

* * *

Poultry Congress Makes History

WHEN the history of agricultural fairs and poultry shows is written, the Seventh World's Poultry Congress and Exposition at Cleveland will be rated as "tops".

During the few weeks previous to the show I ran across persons here and there who began to fear that the thing had been overrated. It must be remembered that for about two years committees had been at work and publicity had heralded the event. Perhaps it was natural for some timid souls to wonder if it all could be true?

My impression is that the show far exceeds expectations, both in attendance and in the character and variety of its exhibits. It was a mammoth exhibition, covering acres of floor space and grounds. Huge crowds poured in from every state in the Union, from Canada, Mexico and from the farthest corners of the globe. I talked with parking station attendants and they told me that on a single day they parked cars from every state and from two foreign countries.

Tribute to Rice

The New York State exhibit, gotten together hurriedly, was a fine display and in its depicting of the historic side of the poultry industry gave added tribute to Rice. Murals forming a background and legends showed how Rice as a student at Cornell began voluntary experiments which led to establishing of a poultry department

which he later headed with such distinction. The exhibit will be seen again at the State Fair in Syracuse.

Many Nations Present

It certainly was a thrilling experience to walk through the Hall of Nations. The "long-crowing" roosters of Japan, with tails 15 and 17 feet long, kept a sizable crowd at attention. Then in a next-door exhibit the wood-carvings which depicted the new poultry industry of Germany attracted many. Across the aisle Italy's display, including the murals from ancient Pompeii, and the Pan-American exhibit, claimed their share of attention.

But perhaps poultrymen were most interested in exhibits of other states, with their colorful backgrounds. Kansas' display space was framed in a lace-work of grain strung on strings. About 1,500,000 grains of wheat were strung on strings by 21,000 4-H Club members. One entered the Virginia exhibit through a replica of Natural Bridge. The Wisconsin exhibit was a breath of the woods and lakes, while Florida used the Everglades as its motif.

The huge auditorium constantly held great crowds to listen to the lectures. Popular programs and demonstrations attracted thousands. To see all of the exhibits one walked miles. It was a great show. The poultry industry should reap far-reaching benefits, from popular interest in poultry and eggs, through pooling of world knowledge and through contacts made by poultrymen from many states and countries.

Western New York Dairy Field Day

Western New York's third annual Field Day at Hamburg on July 29 was an unqualified success. True, it rained most of the day but there was ample room inside for the program and who would object to getting a little wet in view of the need for rain?

Most of the bulls were sold at private sales but in the morning one bull from each of 5 breeds was auctioned off. Sellman Bros. of Orchard Park bid in a Holstein bull offered by Benjamin Newton from Salamanca. An Ayrshire bull bought by John Baker, East Aurora, N. Y., was knocked down to Eugene Foss, of East Aurora. Other auction sales were: Jersey — Clara A. Kline, Williamsville, to Irvin Buffum, Elma; Guernsey — Fred H. Gordon, Brockport, to David Mattison, Brockport; and Brown Swiss — D. N. Boice, Churchville, to Nicholas Smith, Boston. During the day approximately 25 young bulls changed hands.

In the Judging Contests the Webster High School took first place with Alden and East Aurora tied for second. Individual winners were Floyd Rathfus of Webster and Donald Foss of East Aurora who tied for first.

In the 4-H Club contest Kenneth Speer of North Greece took first place, John Moran of Avon second and Donald Cleveland of Leicester third.

In the afternoon James Hayes of the Michigan College of Agriculture gave a humorous talk on "The Form and Function of Dairy Cows." It brought many laughs yet there was many a valuable suggestion that cattle breeders could take home and apply.

One of the places of honor was accorded to a Holstein proven sire, Dad Boast Best Segis Kimpere, owned by a dairy herd improvement association in Chautauqua County, and five of his daughters.

Bar None Ranch Entertains Grangers

Several hundred Grangers attended the Rensselaer County Grange picnic at Bar None Ranch, Berlin, New York, owned by Assemblyman Maurice Whitney. The principal speaker was Louis J. Taber, Master of the National Grange. As usual Mr. Taber hit the nail right on the head and we are hoping to give you a part of his speech in an early issue. Also on the program were Senator Joe Hanley and Commissioner Holton Noyes. Speakers were the guests of Assemblyman and Mrs. Whitney who also provided ice cream and beverages for the crowd. During the day there was a band concert, community singing, a milking contest and sports for the youngsters.

AA-Grange Bread Baking Contest News

Mrs. Arthur Schade, of Lyons, N. Y., winner of bread contest held by Eureka Grange, Wayne County. Contest was close, with five out of nine contestants scoring over 90.

of their contestants, who finished with a fine score, is over 80 years of age—Mrs. Rose Rood, of Cherry Creek, N. Y. Angelica Grange's contest (Allegany County) was won by a "very young housekeeper," Mrs. Howard Lyon, of Angelica, N. Y. Grange Chairman, Mrs. Ralph Jennings, says: "In this day and age when so few people bake bread, a young housekeeper deserves congratulations on being able to bake the prize winning loaf!"

And now here is the list of Subordinate Grange winners sent in since our last report:

Subordinate Grange Winners

COUNTY	GRANGE	WINNER
Albany	Ravena	Mrs. Stella Vincent
Allegany	Angelica	Mrs. Howard Lyon
Cayuga	Dresserville	Mrs. Lillian Ripley
Chautauqua	Cherry Creek	Mabel G. Boutwell
	Findley Lake	Josephine Knowles
	Fredonia	Mrs. C. E. Edmunds
Clinton	Chazy	Doris Duprey
	Moers	Mrs. Lawrence Sweet
Cortland	Cortlandville	Mrs. Earl Stiles
Delaware	Colonel Harper	Edna Adair
	Maywood	Mrs. Marjorie Clark
Dutchess	Chapel Corners	Mrs. L. L. Glover
	Stanford	J. S. Carpenter
	Wicopee	Marie Hoose
Essex	Ethan Allen	Mrs. Harriet Bigalow
Franklin	Burke	Mrs. John Whittenore
Fulton	Kolaneka	Mrs. Jennie Brothers
	Lotville	Gertrude E. Hunt
Genesee	Friendship	Mrs. Florence Ferguson
	Byron	Mrs. Walter Gage
	Pavilion	Mrs. Glenna Westbrook
Livingston	Stafford	Mrs. Esther Becker
	Hemlock	Florence Baker
	Hunt	Minnie Brandt
	Keshequa	Mrs. Leon Goldthwait
Monroe	Irondequoit	Mrs. Peter Weaver
Montgomery	St. Johnsville	Mrs. Rose Johnson
Oneida	Camden	Mrs. Blanche Brewster
	Clinton	Mrs. Ruth Burrows
Oswego	Westmoreland	Mrs. W. M. Colling
Otsego	Pennellville	Mrs. Bertha McMahon
	Hartwick	Mrs. Flora Green
	Seminary	Mrs. Zilpha W. Curran
Schenectady	Duane	Mrs. Roscoe C. Wilber
	Scotch Church	Lucina Taft
Schoharie	Breakabeen	Mrs. Rowena D. Mann
Schuyler	Cayuta	Mrs. Harold R. Worden
	Schuyler	Mrs. Esther C. Wasson
	Searsburg	Mrs. William Giles
St. Lawrence	Fort Jackson	Mrs. George Wolfe
	Waddington	Nellie D. Carr
Ulster	Stone Ridge	Mrs. Ross K. Osterhoudt
Washington	No. Granville	Edith Rathbun
Wayne	Eureka	Mrs. Arthur Schade
	Walworth	Mrs. Dan Dayton
Wyoming	Dale	Mrs. Clara Miller
	Varysburg	Mrs. Albert Meeder
	Warsaw	Mrs. Clarence Duchen

SEVERAL interesting bread contest news items have come in during the past two weeks. In Schenectady County, the contest held by Scotch Church Grange was won by an 18-year-old 4-H Club member, Miss Lucina Tuft, and it was her first loaf of bread! Miss Tuft must be an A-No. 1 cook because last year she baked a sponge cake that won a prize at the Altamont Fair.

Stanford Grange's bread contest (Dutchess County) was won by a man — J. S. Carpenter, Standfordville, N. Y. That makes at least half a dozen Grange brothers in New York State who can bake a prize loaf of bread!

Mrs. Julia Wells, who had charge of contest held by Cherry Creek Grange, Chautauqua County, writes us that one

A New Proposal for Pricing Milk

By LELAND SPENCER.

A GOOD friend who read my previous article on the subject of Production Control has written to urge that we soft-pedal this proposition until the need is more urgent. I readily agree that it would not be wise to urge a production control plan at this time. It certainly is not the purpose of these

Leland Spencer

articles to arouse enthusiasm or demand for production control and I trust they will not have that effect. My purpose is to raise a number of questions and to stimulate some straight thinking on the subject. The serious drought we have had in the New York milk shed the past two months has shortened the feed supply so much that I do not look for much agitation for production control before next spring.

Just a few days ago I had the pleasure of talking with Mr. Clarence Eldridge, a business man in New York City who has two dairy farms in the Eastern part of the state. Few people, I think, have given more serious or intelligent thought to the Dairy Problem than Mr. Eldridge. Some of his conclusions are embodied in a letter from which he has graciously permitted me to quote.

"Nearly everyone", he says, "recognizes that surplus production is the crux of the problem. Raising the price of fluid milk to the consumer temporarily raises the blended price to the producer. However the price of fluid milk is only one of three factors that determine my net return. The three factors are:

- "1. The price of fluid milk.
- "The price of milk used for manufactured products.
- "3. The percentage of my milk that is sold as fluid milk."

In his letter, Mr. Eldridge expresses the view that "what we should strive for is not a too high price for fluid milk, but a better balance between the price of fluid milk to the consumer, the price of milk used for manufacturing purposes, and the quantity of milk produced." "In my own case", he says, "I simply cannot afford to produce milk for surplus uses." But under the present method of paying for milk, the producer cannot raise his net return per cwt. by cutting down his output, or adjusting it more closely to the seasonal demands for fluid milk. With each of 60,000 or more dairymen going his own way, what any one man may do about increasing or shrinking his production will have no significant effect upon the total milk supply, the classification, or the blended price.

Mr. Eldridge has a proposal for changing this situation so that any dairyman who wishes to stop delivering his share of the surplus can get a straight fluid milk price. In brief, he proposes that each dairyman be notified what his share of the fluid market is for each month of the year. Farmer Jones' quota for August would be figured out somewhat as follows:

His deliveries during the three previous Augusts would be averaged, and would amount to say 10,000 pounds. Quotas for all other producers would be figured the same way and might total say 300 million pounds. Then let's assume that the sales of fluid milk for the month of August, 1939, amount to 210 million pounds. That is 70 per

Commissioner Has No Power to Fix Milk Prices

By H. V. Noyes, Commissioner of Agriculture and Markets.

"Judging from the many telegrams I received recently, it is evident that many people think that I have the power to fix prices on milk."

"This, of course, is entirely erroneous. Under the present law, the only prices fixed are those set up under the federal and state order. The only way these prices can be changed is through a petition from the Metropolitan Cooperative Milk Producers' Bargaining Agency, followed by hearings and a determination that it is favored by at least 75 per cent of the producers.

"Under the old milk control set up, prices were determined by the Commissioner in consultation with an Advisory Committee. That law is no longer in effect, and the Commissioner is entirely without any power to fix the price of milk."

ED. NOTE:—We would add that Commissioner Noyes has cooperated in every possible way to help dairymen get better prices.

cent of the normal August production by all dairymen in the milk shed. Consequently the fluid milk quota for each dairyman would be 70 per cent of his average deliveries for the three previous Augusts. Farmer Jones' quota would be 70 per cent of 10,000 pounds or 7,000 pounds. For that quantity he would get the fluid milk price. For any excess over that he would get a surplus price.

If the fluid milk price were \$2.00 a hundred and the surplus price \$1.00, and if Farmer Jones delivered his normal production of 10,000 pounds, his price standard would read:

7000 lbs. "Quota" milk @ \$2.00 per cwt.	\$140.00
3000 lbs. "Excess" milk @ \$1.00 per cwt.	30.00
Total	\$170.00

Now if Mr. Jones should decide that he cannot afford to produce the "excess" milk for as little as \$1.00 per cwt., he probably would dispose of some of his poorest cows and cut his deliveries down to the quota. Very likely a good many dairymen would decide upon this course with the result that the total surplus in the milk shed would be cut down considerably. In that case, even those who continued their previous rate of production would benefit due to the smaller proportion of surplus in the market pool.

This plan is not put forward as a fool proof invention, but it ought to provoke many helpful reactions from our readers.

Dairymen Must Have Higher Milk Prices

(Continued from Page 5)

Cooperative Milk Producers' Bargaining Agency, have worked together.

Representatives of the Federation of Independent Producers, consisting of independent cooperatives not in the Bargaining Agency, met with the delegate meeting of the Bargaining Agency and agreed to work together on a common program. That's real progress!

Another truth demonstrated again by this drought emergency is the need of the dairymen's own organizations. As a result of the dairy marketing cooperatives' quick and emphatic action to meet this emergency, it may be possible to get the government to move fast enough to hold a hearing and raise the price of September milk much higher than it would otherwise have

been. The difficulty always, when the government is in any picture, is to get red tape cut quickly enough so as to get help when help is most needed. The real safeguard would be a voluntary agreement signed and supported by all of the milk marketing cooperatives. If both the Bargaining Agency and the independent groups would agree to such a voluntary plan, then the dealers would have to agree and sign, and government control would then be purely supplementary and not absolutely necessary on a permanent basis.

Federal and state milk control is helpful during the unsettled conditions which have prevailed during these depression years, but government support should be a temporary crutch supplementing the work of the dairymen themselves through their own organizations. The main marketing job must always be done by the organized farmers.

Wool

The 1939 United States wool crop is estimated at 375,699,000 lbs., which is 1 per cent higher than the 1938 crop, about 6 per cent above the 10-year average, and the second largest production on record.

It is estimated that 47,455,000 sheep were shorn—about 2 per cent more than in 1938.

In New York State estimated wool production is 2,301,000 lbs., compared to the 1938 figures of 2,304,000 lbs. and a 10-year average of 2,785,000 lbs.

What Price Apples

(Continued from Page 6)

the apples moved on the open competitive market through wholesalers and commission men; the other half by private sale. The growers saved or made only 8c a bushel on these private sales above the returns from sales on commission; just about what the commission man charged for the same selling service. Doubtless it caused a net loss to these same growers because half the trade quit bidding in the open market and got their apples cheaper from the grower. Private sales at the farm must be cheaper or buyers would not come out from the market to buy. That may be one of several causes of a general decline in apple prices over these last few years.

Direct sales at the farm to truckers who turn over the stock to push-carts at a narrow margin of profit is an excellent way to increase consumption of our poorer grades. It is a service the middle and lower class of consumers must have if they are to continue to be consumers. I want to see that method of distribution fostered, but at the same time I want to do away with the present practice of each grower underbidding his neighbor as the trucker-dealer shops from farm to farm.

I can see only one practical way to curb this practice; that is sell enough apples through the local auction to establish, publicize, and maintain prices. That means each grower should put enough of his crop into an auction pool to have a reasonable supply at every sale. It won't work if we keep on as the figures from Ulster County indicate we have done in the past. According to that study, the growers gave their auction only 5% of the total business, but 43% of their unclassified stuff. No commission man would accept such a consignment, and no selling agency can make a showing or a success if they have only the poorer grades to sell.

The nearby auction is a god-send when no buyers come around to buy, or when you have something you can't sell and are afraid to ship on consignment. That is a good time to practice some of this production control and dump that lot in the cider mill. But if we are determined to dump it on the market no matter what we lose or

how much we hurt the price of good apples, then let's make the buyers bid openly for it, sell at a close margin, and use those cheap apples as advertising to stimulate consumption and act as a brake on the margins added by retail distributors. Furthermore, let's give our auction quality and quantity enough so that outlet is functioning well when we run to it in distress.

In every apple growing section the neighbors should get together in little, informal groups to figure out probable prices, grades to pack, prices to ask, credit reports on buyers and all of those little things that make or break us. No one grower can succeed if the other growers around him are giving fruit away. We will succeed or fail in groups or growing areas, so that is the way and the place to work out our plans for success.

If we do not work them out for ourselves, no one will do it for us.

On August 5 estimated storage holdings of butter were 162,120,000 lbs., of which about 131,231,000 lbs. were owned by private trade; compared with holdings of 178,900,000 lbs. a year ago, or less than this year by 16,780,000 lbs.

Butter consumption has been running ahead of last year. The spread between retail and wholesale costs of butter has been kept low, and retail stores have done a good job of featuring butter. Government figures for the period of January to June indicate that butter consumption has been 11.4 per cent higher than for the same period last year.

■ Victory for Economy and Common Sense

WHEN Congress kicked up its heels and made a wild dash for home early this month, one of pieces of "must" legislation which got knocked sky-high was President Roosevelt's \$3,600,000,000 "spend-lend" bill (supposed to stimulate business through government-guaranteed loans for "self-liquidating" projects, mainly highways, rural electrification, housing, railroad equipment and farm-tenant aid).

After Senate action had slashed original bill to less than half its original size, House killed it outright by refusing even to consider it. Later, at a press conference, President declared that Congress's action would retard recovery. Many economists expressed opposite opinion, and reports of better business have been increasing since this latest pump priming bill breathed its last. Business index has moved to highest level since January.

Majority opinion throughout country has been against "spend-lend" idea, mainly on four counts:

1. That it was a slick way to get around legal limit on national debt by raising money through government bond issues, instead of by direct appropriation.

2. That "pump priming" has had its day and has proved its uselessness as a means of bringing about permanent recovery.

3. That new plan was timed politically to help swing 1940 elections in favor of New Deal.

4. That there are plenty of existing government agencies authorized to loan money on a sound basis. (Jesse Jones, Federal Loan Administrator, told Senate committee recently that if anybody makes loans on a more liberal basis than the Reconstruction Finance Corporation, "they will be grants and not loans.")

SLANT: At last Congress has started the country back on the long hard journey to sanity and common sense in the spending of public money. Had it approved this bill on top of all the other spending which it authorized, this country would have had little hope of ever curbing the spenders. For years this publication has emphasized the folly of trying to "spend our way out of the depression." Spending policy has never brought recovery, but only plunged us deeper and deeper into debt and high taxes. *Let us hope that the turn has now come* and that the American public is fully aroused to the danger of reckless spending. Great credit for helping to defeat the "spend-lend" bill is due Frank Gannett and Dr. Edward Rumely of the Committee of the Nation and their associates, who played a large part in arousing the nation-wide public protest which influenced Congress to defeat the bill.

■ FHA Cuts Mortgage Rate

FEDERAL Housing Administration officials have announced cut of ½ per cent in interest rate on new FHA insured mortgages. This brings rate down to 4½ per cent, plus insurance premium of ½ per cent on declining balance. Move was made to pep up government's housing program. Some

banks in large eastern and middle-western cities had already cut their mortgage loan rates to 4¼ per cent.

■ Free Grass Seed for Drought Areas

UNDER a plan of joint assistance by States and AAA, legume and grass seeds will be distributed free to farmers in drought areas to replace spring hay and pasture seedings killed by drought. Any farmer within a designated drought county, who has lost spring seedings, legumes or pasture, is eligible to ask for the mid-summer seeding. For full details of plan, see editorial, page 4, of this issue, entitled "Important—Free Grass Seed for Drought Sufferers".

■ U. S. Tax Increase Beats Britain's

ENGLISHMEN pay stiff taxes, but even at that their tax burden has not increased as much in past 26 years as U. S. tax burden. According to an analysis of taxes in the two countries, made by National Association of Manufacturers, taxation in last generation rose 430 per cent in United Kingdom, while in United States it shot up 640 per cent.

"Recovery and relief expenditures in

this country have been largely responsible for heavy government borrowing and growing demands upon American taxpayer," says the Association. It points out, also, that British government has operated on a substantially balanced budget, while in this country that has been far from the case. "National debt of England," says the report, "will rise slightly more than 4½ billion dollars in decade ending in 1939, while our Federal debt will rise some 27 billions during same period."

SLANT: Something for taxpayers to think about!

■ Food Stamp Plan Spreading

MORE THAN 100 cities are soon to be added to list of those in which U. S. Dept. of Agriculture has been trying out its food stamp plan. Department officials claim that plan has been successful in increasing consumption of surplus products by families on relief. They point to an 8 per cent increase in food sales in Rochester, N. Y., where plan was first launched.

It is reported that chain stores have passed on benefits of plan to persons other than those on relief by featuring surplus commodities at special prices on a national scale, while maintaining payments to farmers.

■ Europe Has 8,000,000 Men Under Arms

"FALL MANOEUVRES" is what they call it over there, where the armies and navies of leading powers are staging preparations for what many fear may be a second world war before the month is out. German ma-

noeuvres are expected to engage 2½ million men, including regular army and all possible reserves; Italy more than another ½ million; Bulgaria, 290,000 men; Hungary 300,000; Great Britain, 750,000; France and Poland each 1 million men; Turkey, 380,000 under arms; Roumania, better than ½ million ready to fight; Greece, 360,000; Yugoslavia, 340,000; plus the standing army of Russia and smaller nations which are taking part in preparedness movement.

Tension over Danzig situation is reaching high point, with Adolph Hitler the deciding factor. If he attempts another Nazi coup to bring back Danzig to her pre-war status as a part of German territory, he will let loose all the dogs of war, for France and England seem to be fully prepared and willing this time to resist further Nazi aggression.

■ Chains Lend Helping Hand

WITH RECORD 1939 red cherry crop, topping last year's by 79 per cent, New York State Cherry Growers Association announces that chain stores throughout nation have agreed to help move the bumper crop. Chains will stage three nation-wide campaigns to boost place of cherries in America's diet, with emphasis on canned cherries. First drive will get under way as soon as stocks are available; second will take place first week in October; third one during National Cherry Week next spring.

Cherry Growers Association figures that this year's crop is 32 per cent larger than average for past 10 years, and that prices would fall below cost of production levels if chains had not pledged their support in moving crop.

SLANT: Cooperation of cherry growers and chains is another example of sound "surplus control".

■ "A Bucket Per Family"

NORTHEAST is not the only region suffering from lack of rain this summer. Bermuda is experiencing warmest and driest year since it started to keep weather records. Householders there are being asked by Public Works Department to donate or sell water they can spare. In one Bermuda town recently, a notice was read in churches notifying citizens that Works Department would supply them with a limited amount of drinking water—"up to a bucket per family."

So bad is the drought that the island has had to import 2,205 tons of water from United States.

Good Books to Read

THE OPEN SKY, L. A. G. Strong. The story of an author who retires to the simple life of an Irish fishing village after a breakdown. His adjustment to the life of the village folks, and his readjustment to life, make up a story which is dramatic and rich in incident.—*The Macmillan Company, New York.* \$2.50.

Good Movies to See

WINTER CARNIVAL. Fifteen hundred girls invade a men's college, with Ann Sheridan as the heroine. An exciting story of romance against the background of Dartmouth College's colorful winter carnival.

ON BORROWED TIME. Taken from a successful New York stage hit, this is a moving story. How Death is treed and the affairs of the world stand still until people can die again. If you can lose yourself in phantasy for an hour, you will have an experience you won't forget.

What 76th Congress Did

FIRST session of 76th Congress passed into history on August 5th. Here is last minute summary of its record:

SPENT and appropriated upwards of 13 billion dollars—largest spending total in nation's peacetime history. (**SLANT:** Had Congress passed President's "spend-lend" bill, it would have been indirectly added to this colossal sum).

RELIEF: Appropriated \$1,775,000,000 for fiscal year July 1, 1939 to July 1, 1940, but laid down new rules governing WPA wages, hours, and rotation of jobs—all designed to keep WPA from becoming permanent career for some people. Congress also granted an extra 825 millions for fiscal year just ended.

NATIONAL DEFENSE: Voted to spend nearly 2 billions to expand army, navy and air forces—record peacetime program.

GOVERNMENT REORGANIZATION: Finally voted after two years a bill to allow President to reorganize most government bureaus. Bill, however, gave President much less power than he originally asked for; also, makes any of his changes subject to Congressional veto.

TAXATION: Passed tax reform bill which wiped out last vestige of undistributed profits tax on corporations and substituted flat 18 per cent levy; altered capital gains tax, and permitted Federal and State governments to tax income of employees of the other. (Both undistributed profits tax and capital gains tax had proved to be heavy burden on business and were attacked as obstacles to recovery.)

MONETARY: Continued President's power to devalue dollar; continued 2 billion dollar stabilization fund.

AGRICULTURE: Passed annual appropriation bill carrying record total of \$1,195,000,000, exceeding by \$237,000,000 last year's appropriation. Increase was due mainly to Senate amendment appropriating \$225,000,000 for parity payments to farmers. At last minute, Congress granted U. S. D. A. another \$119,000,000 to continue CCC (Commodity Credit Corporation) crop loan program at its present level.

POLITICS: Passed Hatch bill to limit political activity by Federal officeholders in general, and WPA officials and workers in particular.

SOCIAL SECURITY: Amended Social Security law to begin old-age pensions in January 1940 (instead of Jan. 1942); increased Federal contribution to States for old age assistance to \$20 per person; voted to freeze payroll taxes at 1 per cent until 1943 (instead of increasing rate to 1½ per cent in Jan. 1940).

LABOR: House ordered investigation of National Labor Relations Board by a House special committee. (**SLANT:** Committee has been appointed and it looks as though this country may at last get an impartial inquiry into conduct of this Labor Board.)

Here They Are . . .

THE WHOLE FAMILY OF

NEW FARMALLS

Features of the New "H" and "M" Farmalls

- 1 Comfort—sitting or standing. Adjustable sponge-rubber upholstered seat.
- 2 Clear vision—smooth, streamlined design enables you to see your work.
- 3 Balanced power. Smooth-running 4-cylinder, valve-in-head engine, with Tocco-hardened crankshaft, full force-feed lubrication, and replaceable cylinder sleeves. Brilliant performance and amazing economy on No. 1 tractor distillate and other tractor fuels.
- 4 Five-speed transmission. Four field speeds, plus a 16-mile road speed (on rubber). Variable governor—you can control driving speeds within "inches per hour."
- 5 Patented automatic steering-wheel cultivator gang shift. Clean cross cultivation at 4 or 5 miles an hour.
- 6 Finger-tip auto-steering. Brakes can be operated separately for making short or pivot turns—or as a unit on the road.
- 7 More than 30 high-grade ball and roller bearings. 19 rawhide spring-loaded dust and oil seals.
- 8 Can be equipped with "Lift-All," which lifts and lowers machines, or front or rear sections, on either side.
- 9 Adjustable wheel tread—for all row-crop requirements.
- 10 Most complete line of quick-attachable machines.

THE NEW SMALL FARMALL-A with "CULTI-VISION"

Here is Harvester's new small Farmall, with features you have been waiting for: power, speed, economy, and "Culti-Vision." Built to do all the work on the small farm, or to replace the last team on the big farm—and it sells at a new low Farmall price. Direct-attachable machines are available for all row crops, including vegetables. Ask us for complete details.

FOR 17 years the FARMALL idea has been setting the pace in power. FARMALL is today the No. 1 farm tractor in the land. The whole power farming picture has been changed by half a million FARMALL tractors on the job. . . . And NOW comes a brand-new family of FARMALLS to step up farm power efficiency all over again!

Last month we introduced the small FARMALL-A with its great new feature, "Culti-Vision."

Here's your first view of the little fellow's big brothers—FARMALL-H and FARMALL-M—spic and span from the Harvester factories, raring to go!

First view shows you up-to-the-minute appearance—the hand-

some lines of farm power that is *practical for the fields*—modern styling in the famous FARMALL red. But the real thrill will come when you get hold of one of these steering wheels, give the smooth 4-cylinder engine the go-ahead, and put a new FARMALL through its paces.

Here are three bears for work—big size, middle size, small size! You'll find each one a go-getter in every inch and ounce. Step out ahead with your choice of the new FARMALLS. See the McCormick-Deering dealer for the full story. *Satisfy yourself* about the *quality, utility, power, comfort, and economy* of these great new tractors—and about the new low FARMALL prices. Catalogs on request.

DOWN THE

By J. F. (DOC) ROBERTS

THERE ARE two big sheep con-
troversies: First, whether to plan
to raise black-faced sheep or white-
faced sheep, and, second, whether to
hold your ewe lambs for replacement
purposes, or whether to sell as lambs
and in the fall buy yearling ewes. I
am not going to try to settle these
questions. Probably they should not
be settled anyway, because there are
conditions where they all have their
rightful place.

Black-faced lambs will put on gain
and mature faster, but unless fed a
heavy and a good feed will not fatten
and will get coarse. The black-faced
ewes will not live so long and are not
so hardy—that is, they will not stand
as much poor pasture and rough win-
ters. Black-faced lambs make the
most satisfactory meat, where they
have grown rapidly and fattened quick-
ly, but it is almost impossible to let
them grow to be big, thin lambs, and
then try to fatten them. White-faced
sheep will generally shear more than
black-faces, but their wool will not
bring quite so much per pound, al-
though probably as much for the entire
fleece. White-faced lambs can be
grown and then fattened, but again,

generally speaking, they are not so
big boned. They will not produce as
much weight as rapidly as the black-
faces, but where lambs are run on pas-
ture and then brought into the barn
for fall and winter fattening and feed-
ing, they are the most satisfactory.
Summing this up, the thing you should
be guided by is the type of farm and
the sheep operation best suited to your
conditions.

Whether to buy replacement ewes or
raise them should only be settled on
an individual basis. There are men
who can produce 80 to 90 pound
lambs in five or six months who would
be very foolish to carry these lambs
over for another year or eighteen
months for breeding purposes, and yet
there is a selective value there, from
a breeding standpoint, that should not
be lost sight of. But, generally speak-
ing, the man who can average \$7 to \$9
for his six-months-old lambs should
sell and buy his replacements continu-
ally from Western range stock. A
great many men try to start in the
sheep business by going around the
country and picking up what look to
be cheap animals from flocks which
are for sale, and when they get through
they have bought all the trouble and
all the disease from the entire neigh-
borhood and are never successful.
Therefore, I cannot but strongly advise
any man who is planning to start in
the sheep business to start with disease-
free, Western range, yearling ewes.
The Texas range ewe is not recom-
mended for this country, and you can
well afford to pay the increased price
for Northwestern range ewes over the
lower priced Texas ewes. These ewes

can be purchased through any good
livestock commission firm located on
any of our larger terminal markets,
and can be handled in any size lots, al-
though 250 head would be one double
deck car.

There is one thing in connection with
breeding ewes about which there is no
argument, and that is that no man
should even attempt to raise lambs un-
less he uses a pure-bred ram.

* * *

"Please explain the opportunity exist-
ing in the Northeast for fattening
Western lambs," is a request that I
have received from Mr. H. R. Black of
Pittsburgh. The real opportunity is
brought about by the fact that we can
produce roughage in the Northeast
cheaper than anywhere else in this
country, and inasmuch as a lamb will
eat approximately three pounds of
roughage to one pound of grain in a
fattening operation, we are in a posi-
tion to put on weight and fat as cheap-
ly as anywhere, even though we buy
all our grain. On top of that, we are
in the midst of the greatest lamb-con-
suming center in the country and do
not have the marketing costs that lamb
feeders further West must face. To
be sure, we are shipping our raw ma-
terial from the Western range east,
but we are shipping a fifty or sixty
pound lamb and marketing an eighty
or ninety pound lamb, whereas they
must ship the eighty or ninety pound
lamb.

Again these lambs can be purchased
through any reliable commission firm
on any of the larger markets. In fact,
I buy between 30,000 and 35,000 every
year for a great many different feed-
ers and have them shipped from the
range or the market to the nearest
railroad unloading point to the feeder.
These cars come loaded with 300 to
350 lambs and are divided among dif-
ferent individuals, where any one man
cannot feed that many. Good roads
and the truck have made this possible.

ALTAMONT JERSEY FARMS

at Altamont, Albany County, N. Y.

Established by Perley A. Dutton, Importer and
Constructive Breeder of Jersey cattle for 25
years.

Modern Heating for Farm Homes

This fine old farm house in the Mohawk Valley was constructed before the days of central heating plants. That does not mean that a central heating plant is impractical. It does mean that designing the installation of such a plant is no job for an amateur.

The house is now heated with a central system installed by the UTICA RADIATOR CORP. of Utica, N. Y., and is giving satisfaction. Utica Radiator Corp. engineers are available to any home owner. Without obligation they will examine a house and recommend the best type of heating system to meet the individual conditions of that house.

When you visit State Fair, visit the Utica Radiator Corp. display in booths 58 and 60 in the M. & L. A. Building.

Mr. Frank Hamlin of the PAPEC MACHINE COMPANY, Shortsville, N. Y., reminds us that there will be few exhibits of farm implements at the New York State Fair this year. Says he:

"Each year a good many farmers come to the Fair with repair part orders in their pockets."

If you need repairs, do not delay ordering them until State Fair as there will be little opportunity to contact dealers to secure them at that time.

The main offices and factories of the EMPIRE MILKING MACHINE CO. have been moved from Rochester, N. Y., to West Chester, Pa., near Philadelphia. Manufacture was started in the new location a short time ago.

J. D. Mitchell is the new manager of this old established company, and C. T. Trimble, who has been with Empire for many years, is in charge of the service department. No changes have been made in the field organizations nor in the branch offices and warehouses at 159 Brook St., Elgin, Ill., and Dallas, Texas.

In addition to the regular lines of milking equipment, Empire has developed a new improved Portable Electric Milker,

which is a compact, complete unit for milking up to 20 cows, and is offered at a price that will be attractive even to small dairymen.

Parasites are one of the pests which hold down poultry profits. DR. SALS-BURY'S LABORATORIES of Charles City, Iowa, have conducted extensive research on the problem of controlling worms in poultry, and under the trade name "Rota Caps" have put a new product on the market which they believe will be welcomed by poultrymen. If this product is not available at your dealer, a post card to Dr. Salsbury's Laboratories will bring you full information.

No farmer will dispute that the control of weeds is a serious problem. "Weeds—Farm Enemy No. 1" is the title of a booklet published by the BEMIS BROS. BAG CO. of St. Louis, Mo. It contains a general discussion of weed control and a partial list of noxious weeds, with recommendations for their control. The Bemis Bros. Bag Co. will be glad to send you a copy if you will drop them a postcard.

The boys on the early morning shift at the electrified farm at the World's Fair enjoy a breakfast of G.L.F. pancakes. From left to right in the picture: Con Tru-fant, blacksmith from Frankestown, New Hampshire; Charles Pratt, late of Cornell University Agricultural Engineering Department; Bob Congdon, a converted cow hand from Brooklyn; Ray Lauder, late of Cornell University Animal Husbandry Department; Meredith Bryant, Massachusetts Agricultural College; John Johnson, herdsman with the Jersey cattle from Meridale Farms; Paul Visser, from Iowa State who is in charge of the horses. Jim Nugent, a combination of night watchman and cook, is standing in the background.

Jesse Moulton, manager of the farm, writes: "This picture was taken about six o'clock in the morning so you see things really begin to happen quite early at the Electrified Farm just as they do on a regular dirt farm."

NEARBY MARKETS for NEARBY POULTRYMEN

Struttin' But Not Cocky

By J. C. HUTTAR

THE day has come. The "little red hen" has become of age. Poultry people no longer apologize for the business they're in. The townspeople of Cleveland, Ohio, are still asking each other in wonderment and surprise, "Where did all these chicken folks come from?"

J. C. Huttar

When Jimmy (Prof. James E.) Rice told officials of the city of Cleveland some two years ago that the World's Poultry Congress would draw 500,000 people, they said, "That's fine." But they hardly believed it. No wonder they were dumbfounded then when, after only seven of the eleven days of the Poultry Congress had passed, the total attendance figures stood at 546,000. Two days later they had mounted to 716,000.

When I think of all the folks from the territory where this paper goes whom I saw at the Congress, I'm beginning to wonder who I'm writing this for. It seems that everybody in New York, New Jersey and Pennsylvania who keeps any chickens was there. But I suppose there must have been a few who stayed home, so I'll just give them a few of the highlights.

Eat Eggs and Chickens

You folks who read this column of mine of course know that the big thing with me is consumption of eggs and poultry. I don't claim that it is the most important need of the poultry industry, but I believe very sincerely that it is the one important thing about which the least is being done. So my interest in this Congress has been mostly generated by the hope that it would arouse the interest of city and village folks to the high nutritive value of our products and bring the hen keepers of the country close enough together that they can all work together toward the one goal of greater consumption of eggs and poultry meat. It looks entirely possible to me now.

Eggs

The Chicago and New York Mercantile Exchanges each had exhibits and literature primarily for the benefit of egg producers to try to make clear to them what is the purpose of these institutions in these two largest markets.

Mr. C. B. Rader, manager of the New York Exchange, has recently compiled a most interesting booklet on the marketing of eggs in Metropolitan New York. Copies of this were passed out to Congress visitors. I'll be quoting from it from time to time in my future articles.

Distribution

To me, one of the most gratifying things was the large exhibit of the Fisher Food Stores, featuring White Gem eggs. Fisher Food is a Cleveland chain of about 300 grocery stores. They sold great quantities of these locally produced eggs right at the Congress. I got some of the story of this project from Dave Ferneau, manager of the egg marketing division of the Ohio Farm Bureau Cooperative Assoc. Dave tells me that the eggs in Fisher's White Gem cartons are all govern-

ment graded and furnished by his organization. He went on to say how the Fishers had 68 large billboard "ads" throughout Cleveland pushing the sale of these eggs. And that they merchandised them at the very low margin of five cents a dozen including the carton. In four years, according to Dave, the sales of these top quality eggs had increased from 20% to 40% of their total egg sales while the sales of the ordinary eggs took a corresponding drop.

It looks to me like we have a very practical demonstration here of how folks will go for fine eggs if they are reasonably priced and if they can be sure that they're getting what they're paying for. Furthermore, the Fishers think it's a great thing because it puts the stamp of quality on their stores in the minds of consumers.

More about this part of the Congress later. In the meantime let every poultry keeper of 300 hens or more remember we've got a strong and united industry.

The federal and state governments now know it, for they had many of their officials there. Other folks know it too, for the press in many parts of the country has treated the Congress as big news.

So let's strut a little, but not be too cocky.

Transparent Kitchens

You remember my telling you some time ago how the cooking of eggs and poultry was going to be shown by continuous demonstrations in transparent kitchens? Well, it was. From the time the Congress opened until it closed, some of the country's best cooks and chefs were working in three such kitchens before overflow crowds.

Turkeys

A large turkey growers' association had a beautiful exhibit of their product. In it they told of the romantic history behind the Thanksgiving Turkey dinner and how the turkey was America's festive bird for all occasions. A mouth-watering display of dressed turkeys in large refrigerator show cases made the foreground of this exhibit. I made it a point to stand in front of this particular booth for quite a spell almost every day. There was a good crowd filing through it almost continuously and the folks seemed to enjoy it.

Practically everyone who went through the large booth picked up some of the printed literature which the turkey folks placed where it was easy to pick up.

The turkey folks seem to be pretty well organized and, to my mind, made a very favorable impression on the people attending the Congress.

"The freaks are over on this side, Pop—there's nothin' wrong with her!"

WORMS

Steal FEED!

- LOWER VITALITY Wreck Egg Production

TREAT Your FLOCK NOW!

Worms can quickly ruin a thrifty, profitable flock. Take no chances! Treat your birds now with Dr. Salsbury's Rota-Caps. Their Record Of Performance on thousands of farms, with millions of poultry, proves:

- (1) They get large round worms, capillaria worms, and these tapeworms, heads and all: *R. tetragona* and *R. echinobothrida* in chickens, *M. lucida* in turkeys.
- (2) They don't set back growing birds.
- (3) They don't knock egg production!

Get Rota-Caps from your Dr. Salsbury dealer, or order direct. State quantity and size; enclose check or money order.

Poultry Congress

Rings the Bell!

(Continued from Page 3)

State exhibit featured six mural paintings showing the progress of poultry industry in the Empire State by ten degree periods since 1890, when the poultry industry was too insignificant to be included in crop reports, to the present time when the state's income from poultry amounted to \$52,000,000. In the center of the exhibit was a map of the state and on this as a background moving pictures were shown depicting the poultry industry of various sections. Plans are under way to show this exhibit at the New York State Fair.

The New Jersey State exhibit featured a map of the state showing the location of egg auctions and featuring eggs and some unusually fine pictures of the poultry industry.

A mechanical hen occupied a prominent place in the Massachusetts booth. Working parts showed in a diagrammatic way just what happens to the feed the hen eats. Another feature was a model poultry farm on a revolving platform.

The background of the Maine booth showed forests, mountains and lakes typical of that state. Attention was called to the fact that trap nests were used in that state as early as 1898 and day old chicks were shipped as early as 1897.

New Hampshire featured the freedom of hens of that state from pullorum disease, the high hatchability of eggs and the low mortality of chicks.

In the center of the Connecticut exhibit was a mammoth egg, while at each side was a book of pictures nearly as tall as a person. The leaves of the book were automatically turned, giving spectators in a few minutes a visual idea of the poultry business in that state.

Pennsylvania pointed out that it ranks first among States in the volume of eggs produced. On the floor at the front of the exhibit was a keystone, the emblem of that state, and the exhibit was completed by pictures and an enormous map of the state.

Ohio, as the host state, outdid itself by putting on a puppet show with chickens and ducks as actors. The show played to full seats and, as usual, father and mother did not hesitate to take Willie to the show.

Almost continually there were talks and discussions by poultry authorities on subjects of interest to poultrymen, and at the same time there was another program of scientific talks given by authorities from many countries.

It is a difficult matter to transmit through printed words the size, success and enthusiasm of the World's Poultry Congress. If you were there, you caught it. If not, we trust this report will give you a feeling of pride that you are a part of an industry that can put on such a show. We trust, too, that it will inspire you to add your support to further efforts to put the poultry business on the map and keep it there.

"That's nothing—a whole flock visit-ed Mamma's cousin!"

BABY CHICKS

Hall's Chicks

Leghorns—Reds—Rocks—Wyandottes
New Hampshires—Hallcross (Crossbred) Chicks

All chicks produced from flocks tested for Pullorum Disease (B.W.D.) by the Official State testing agency of one of the six New England States, with NO REACTORS FOUND. Tube Agglutination tested within the preceding calendar year.
